"PRISONER'S DREAM" FALLS.

A DIM, half light hung o'er the glittering verge; A nurmur fluttered, faint and soft and low. The indistinct, fond dreams of long ago Came floating back, envergeathed in shadowy serge, Of tangled mist. A solemn, sombre dirge Rolled upward with a mourraful cadence, slow. Where down the double fall the stendy flow where down the jetting spray at every surge Flung out the jetting spray at every surge Of welling water. Draped in silent thought Eow-leaning trees swung swaying shadows down The rapids—down a found-feeked, sinuous gleam Dinning their houghs caressingly, unsought, the grim rock's beetling jailor's-frown; Beneath, the fleeting, phosphore rescent stream.

John Phiston True.

The East Branch of the Henobscot.

TWO HUNDRED MILES THROUGH MAINE IN A CANVAS CANOE.

OFTEN thought how easily one could stray from camp, and if without a compass, be lost in this While hunting on Lake Superior, one wilderness. autumn some years since, I endured such an experience, and the bitterness of it has always remained While passing over the corduroy freshin my memory, road of thirteen and a half miles which lies between the town of Ontonagon, Michigan, and the Minnesota Copper Mines, my attention was allured from the road by melodious whir-r-r-r, whir-r-r-r of a brace of partridges. Stepping aside into the thicket, I followed as fast as possible the retreating sound, and after a tedious tramp through briers and swamp, I finally brought them to bag. In the excitement of the chase I had given little or no heed to the path or to the clouds that were fast gathering overhead. Starting back in the direction I supposed the road, I travelled, it seemed to me, double the distance that would have revealed it, but no familiar path did I find-in fact, I was amazed in discovering that I was back on the same ground on which I had started, There was no reason in the thing, no reasoning against it.
The points of the compass had been as clear in my head as if I saw the needle, but the moment I was back all seemed to be wrong. The sun, which occasionally revealed itself, shone out of the wrong part of the heavens. I climbed one of the tall trees, but the very stillness of the landscape on which I gazed seemed to mock me, was not a novice in woodcraft, and could follow a trail I examined the bark of the trees to see which readily. side was the roughest, and then singling out a number, judged of the point of the compass the ma-jority leaned, and plunging into the thicket, made another and another attempt. I well knew the danger of losing my self-control, and sitting down on a rotten log, I covered my face with my hands, and waited until I felt calm and self-possessed again. I have no idea how long it was, but when I arose the sun was nearly obliterated by the clouds, which soon began to discharge their contents, in sympathy for my ill-luck, and to reach my destination I must make all speed.

I immediately struck a "bee line" in the direction which my reveries had designated as the right path, blazing the trees with my hunting knife as I hastened along. Soon I espied an opening, and dashing onward,

along. Soon I espied an opening, and dashing onward, what was my joy to find the old corduror road, which never looked more welcome in its life.

FromGrand Lake to the junction of the East with the West Branches of the Fenolscot it is sixty to sixty-five miles, the river being shut in on all sides by lofty mountains or heavy belts of grand old forests, through which the swift river tumbles, with only an occasional suggestion of the lumberman's axe. There are eleven conspiction of the lumberman's axe. There are eleven conspictions alls in this interval, varying from twenty to sixty feet in height, while the charming cascades are too numerous to mention. The abrupt descents have the names of Stair, Haskell Rock, Grand, Fond Pitch, Hulling Machine, Bowlin, Spring Brook, Gravel Bed, Whetstone, Griodstone, Crowfoot and Ledge Palls, their names in many cases suggesting their wild and rugged formation. formation.

The water swept so swiftly through this section that, with the exception of the last twenty miles, it was

hardly necessary to use our paddles, but keeping an eye to the rocks in our path we could silently enjoy the many lovely changes constantly epening in the land-scape. But this also was decidedly the hardest part of the entire excursion. At most of these falls our whole camp equipage, provisions and canoes had to be "sacked" around the falls from one to two miles, and in many cases there was hard climbing along the steep, rocky sides of the mountains which followed the river's course, while each one of us carried his portion of the load.

rocky sides of the mountains which followed the river's course, while each one of us carried his portion of the load.

For two and a half miles, after leaving Grand Lake, one is constantly reminded of the day's experience on Webster Stream, by the furious rapids, and we were again obliged to call into action our "setting poles." In a drenching rain, we were compelled to land on the shore, take the canvas boat into our laps and sew the cuts in its surface, laughing at the philosophical manner we submitted to the circumstance. Along the river's bank to the wost for many miles, are the lovely Traveler Alountains, whose rambling appearance and daily companionship are fully represented by their name.

Stair Falls, the Quartermaster and myself ran in our canvas cance, but the guides tending their birches as if they were glass, dropped them from step to step by means of ropes. This fall or cascade is a series of steps or stairs, some five in number, each about three feet high and two feet apart, the best passage being through the channel near the left bank. It is a very choice bit of transfer to canvas and work into endless variety of composition. A ten mile passage of the swift river, and we reached Grand Falls, which although higher than its namesake on Webster River, being followed immediately by numerous cataracts, did not so impress one. Here we were obliged to make a portage of three-quarters of a mile through the dense woods to the foot of the falls, and in a heavy shower went into camp on the opposite shore. To the "camper-out," a rainy day in the woods is among the most disagreeable experiences, even under a tight tent, good company and plenty of amusement. But increase the difficulties by being forced to be out in the storm, and to leave your canne at a portage and obliged to carry my our back through mud and mire all your camp effects. Through the woods you stimible, pressing the wet branches aside, which, in their recoil, push away your rubber clothing from which the buttons are fast disappearing and the r

garding the "poeury, preserved woods," until you had rather endure another storm than their irony.

Then the raising of the wet tent into position, the repeated attempts to start the fire, and the holding of every individual fir branch to dry in the flame, before performing the duty of bed. Two forked sticks, with one across, are placed before the fire, and on then you hang boots, socks, blankets, and other articles of your belongings; and while the guides are cleaning your guns you examine the provision boxes to see if they have escaped the drenching. It is amusing how stoical and indifferent one grows to these circumstances in the woods, and soon makes but little of them, retaining as serene and unruffled a disposition as if they were of no account, while after a warm supper and a social pipe they pass from memory.

I will not weary the reader by a description of the pasage of each fall from day to day on our route, some of which we ran and past others we "carried," letting the cances as before over the difficulties by long ropes from the cliffs above. After passing Spring Brook and Gravel But Falls we paddled through a mile or two of heavy

the river near a place known as Hunt's Farm. The solitary log-house and barn of Hunt's Farm were erected some forty-three years ago, and are located on high ground in a picturesque bend of the Penolscot River. The house outside is painted red, whitewashed inside, with low ceilings, similar to the others mentioned. In addition to the cultivation of land near the house, an attempt was made some time ago to press into tillage as a melon patch the side of an adjacent mountain. But the fruit, as soon as they grew heavy and ripened, snapped their hold on the vines, rolled down the mountain side and were crushed at its base. As can easily be seen, this elevated farm was not a success; and now only the bright green foliage of a fresh growth of trees is left to tell the melancholy story. Mr. Dunn, who, assisted by three other porsons, takes care of the place, showed us many attentions, supplying us with fresh milk and sugar and other delicacies that had been foreign to our fare at camp for many days. The manufacture of birch canoes seemed to be one of the industries of the place, an innuense one being then in process of building for a celebrated New York artist, Frederick E. Church, Esq. This canoe was twenty-eight feet long, over four feet wide (mishispis), and when completed would weigh three hundred pounds. The artist had recently purchasel four hundred acre of land over on Millinoket Luke, lifteen miles distant, a tributary to the West Branch of the Penobscot River, one of the prettiest sheets of water in that vicinity. A fine view of Mount Katabilin can be had from this spot, and men were to leave this farm the following day to erect there substantial log cabins.

The ascension of Mount Katabilin can with little difficulty be made from Hunt's Farm, where a convenient rively hundred feet high opposite our camp, nor the magnifecant view from its peak.

With Mr. Dunn as guide, in company with the quartermater, I started to make the ascent on the morning of house the sense wilderness is an entirely different undertakin which we had so between years of managed has and caseades subdued to a level with the sourcounding landscape. Those two streams sweep away to the south twenty miles, and unite in unbroken union at Medway on their way to the sea. Before me arose the cloud-capped peak of Mount Katahdin, 5,385 feet high; Wassataquoik Mountain, Staff feet high; the lofty Traveler and Sourdinahuk Mountains, which, with the exception of the first, are wooded to their summits. Broad scans or slides no visible along the surface of old Katahdin, which with its triple peaked outline seemed to look down into the valleys with a fatherly interest. The thunder clouds had just parted and a beautiful rainbow arched the heavens, shedding its colors on the glistening outlines of valley and mountains. Oh! that we might be left alone for hours to watch these changes of the landscape, and hear the secret voice and dread revelations of these magnificent mountains.

There are thoughts deep and holy which float through

sition as if they were of no account, while after a warm supper and a social pipe they pass from memory.

I will not weary the reader by a description of the passage of each fall from day to day on our route, some of which we ran and past others we "carried," letting the canoes as before over the difficulties by long ropes from the citifs above. After passing Spring Brook and Gravel fells we paddled through a mile or two of heavy "rips" and entered some two miles of "dead water."

On turning a beautiful bend in the river, what was our surprise to observe the rugged growth of pines gradually disappear and the landscape immediately softened by the introduction of a dense forest of maple, clin, ash, and noble oak trees, whose paraled trunks pashed themselves far into the stream, their branches overlocking above our heads forming a canopy that darkened the water.

Exclamations of surprise rang from our lips as all the canoes in "Indian file" diffied through this enchanting bower, and we thought to oursolves if in the quiet dress of summer this is so lovely, what must it be when robed in autumnal foliage, Passing the mouth of big and little Seboois rivers, we pitched our tent on the left bank of which we had "sacked" over the ledges at the riverse should be a scene of the case of the case of the stream, then shot across and down a camoes in "Indian file" diffed through this enchanting from our lips as all the lands of the stream, then shot across and down a camoes in "Indian file" diffed through this enchanting from our leads forming a canopy that darkened the water.

Exclamations of surprise rang from our lips as all the lands of the stream, then shot across and down a canoes in "Indian file" diffed through this enchanting from the trees of high picturesque of the stream, then shot across and down a many stream of the stream of the file was all the lands of the stream of the stream of the file was all the lands of the stream of the stream of the stream of the lands of the stream of the lands of the stream of the la

Crowfoot Falls, each from ten to twenty feet high, the name of the former being so suggestive by its geological formation that the Quartermaster declared that he could honestly see the indentation of the axle. Another camp seven miles from Medway, and in the morning we passed Ledge Falls, which although the last of the pitches on the East Branch, was none the less interesting. We passengers, to lighten the cances, strolled along the shore gathering bright flowers and curious colored stones, while the crides, along in their cances, ran the caturate, meetsengers, to lighten the canoes, strolled along the shore gathering bright flowers and curious colored stones, while the guides, afton in their canoes, ran the cataract, meeting us in the dead water below. These falls are composed of slate of a greyish color, which after the first steep pitch form into numerous cascades, produced by the sharp ridges of rock which, extending out into the stream from both shores, decrease in height as they approach the center. A dark red stone attracted my attention and I waded into the water to secure it, and on regaining the canoe soon after, threw it into my camp bag, little dreaming of the value of my prize. On reaching home it was examined by an old and experienced lapidary, and proved to be one of the finest pieces of jasper ever found in this country. A portion of the stone as an article of jewelry incrusted with the magic words "Ledge Falls," is highly prized and now worn as a souvenir by the writer. The stream now gradually widens, with a strong but neiseless flow; the mountains retire, and the banks of the river are for the most part bordered by foot-hills and grassy knolls. Glimpess of civilization begin to dawn as we occasionally pass a log-house whose lonesome appearance is only relieved by the happy faces of children at the door. Corn fields wave their fall stems, while broad patches of potatoes (for which Maine is justly celebrated) flourish here surprisingly. It is a sudden change from the forest depths, after a month's camp life, and seems to mere us towards home more and more rapidly.

We are soon at the junction of the East and West chanches at Medway (as small town on the left bank of the Penobecot River, of about four hundred inlabitants), and are speeding still faster and faster through the broad river to Mattawamkeag on the European & North American Ballroad. We have followed the river in its devious windings, from a width of fifteen to now an expansion of over live hundred freet. We have felt bent entrysterions

are speeding still faster and faster through the broad river to Mathawanikaag on the European & North American Railroad. We have followed the river in its devious windings, from a width of fifteen to now an expansion of over five hundred feet. We have felt the mysterious silence of the wilderness at early morn, or as the twilight lessened and the shadows deepened about the camp, only broken by the chirp of the cricket or the weird and plaintive cry of the bons on the lake.

Our tour has been one of daily excitement filled from first to last with grand old forests, noble waterfalls, picturesque lakes and cascades: a region in which an artist might linger many weeks with profit to both eyes and brush, while the recuperation to one's health by the outdoor life in the dry atmosphere cannot be over-estimated. Springing ashore we unjoint our rods, pack up the camera, collapse the cannas cance, and with hearts full of thanks to the kind Providence which has watched over our two hundred mile voyage, we bade adden to our guides, as we do now to the reader.

guides, as we do now to the reader.

THOMAS SEDGWICK STEELE.

A WINTER IN LOUISIANA.

A WINTER IN LOUISIANA.

To those who dwell in high latitudes, and among hills and mountains, the first sight of "Tuckepaw" County, is simply a revelation.

Inagine a low, flat meadow-like land, threaded by innumerable streams and dotted with millions of tiny fakelets, all of which streams and lakelets have a common parentage in some huge, monster-like reservoir; all lying parkling bright in the rays of the winter sun, and all seeming to lead an aimless existence, and all running nowhere, and all likewise ending nowhere.

Such is the Attapakas County, corrupted into "Tuckeraw," as I saw it one bright winter morning in the year of our Lord 1850.

Three years of very hard work in the school-room, supplemented by an intense desire to become thoroughly acquainted with Blackstone, Chitty, Greenleat, and other musty old files of the legal persuasion, had so shaken me physically, that I gladly accepted an invitation from a great-annele to recuperate myself by shooting and fishing in Louisiana for a whole winter.

"Behold of me then!" as our lively French friends say, on the good steamer Elephant, flying on the wings say, on the good steamer Elephant, flying on the wings of steam away from the hyperborean regions of Kentucky to the soft skies and Italy-like weather of Southern Louisiana.

Our boat was crowded with the usual mothey crowd

to the soft skies and Italy-like weather of Southern Louisiana.

Our boat was crowded with the usual motley crowd that could then be found on every steamer running on the Mississippi, from the planter who made five hundred bales, haughty, cool, and contemptuous, down to his humble compeer of five bales, ignorant, excitable, and humble.

humble.

Iam sorry, alas, to record that there were many regues, negro dealers, and gamblers, men who, at the South, have ever been regarded as cleavaliers dinalastic, that is, gentlemen who live by their wits; exploiters, who lived like princes to-day, blazing in diamonds, and to montow, so poor as not to have money to buy a single

meal.

After the first day or two on a steamer, there are naturally formed little cliques of those who are congenial in taste and sentiment. Among those whose acquaintance I formed was one of the most agreeable, the most eccentric, the most lovable ment that it has ever been my good fortune to nicet. Dr. C—— of Mississippi—I wonder if he still lives. Should be be alive, and see these lines ha will know how much the "Major" Joved him. God bless him! real, true gentleman!

Dr. C—— was a little deaf, and it was a source of inexhaustable fun to une to invent long inaginary conversations which various parsons held about bin; jidalognes, I am sorry to say, wanting in the attic salt of the Noetes Ambrosiance, but with enough of malicious personality to cause the Doctor's black eyes to snap, and his long black board to curl, a sure sign of anger in bira.

Then when any of the parties whom I had so wifully maligned showed any weakness (let us say an amiable weakness) the Doctor would ponnee upon him, as a lordly African lion lying in wait for his prey, and crunch his bones in a linguistic way, so that the innocent victim felt very had indeed.

The Doctor was very fond of card playing, and he and the mate of the boat, a bunly, course fellow, would often play euchre by the hour. The protection of the play and a play euchre by the hour. eal. After the first day or two on a steamer, there are nat-

coward—no unusual combination. It was during one of these nocturnal orgies, prolonged until the "wee sma hours ayant the twal" that the Doctor had very uncerehours ayant the twall" that the Doctor had very unceremoniously given the wale the lie. Now, I have not the
least doubt that the mate lied. Indeed, I am certain that
he lied, lant at that time in the South every fellow tried
to consider himself the equal of overy one, and tried very
hard to make himself and others believe that he was a
gentleman. In fact, most of the street fights and bloody
encounters were with men of this class, who having no
education and no refinement, tried to substitute the pistol for good manners, and often succeeded in literally
shooting their way into good society. The mate was
ambitious, and as it was the first time that he had over
sat down with gentlemen, now was the time to cover

shooting their way into good society. The mate was ambitious, and as it was the first time that he had over sat down with gendlemen, now was the time to cover himself with glory.

What was my astonishment next morning, after breakfast, when Dr. C., after giving me a graphic detail of what had transpired the night before, he asked mo to stand as his second in a duel with the mate which had been arranged to come off at Baton Rouge. I agreed readily to act as the Doctor's second, with a mental reservation that he should never meet the mate, bully, coward, and no gentleman, if I could by any means prevent it. At that time I was a crack shot with revolver, rifle, or shot gun. I owned a pair of Colt's heavy revolvers, with which, by constant practice, I could at thirty yards hit a silver half dollar every time. At the next wooding station, seeing the mate on shore directing the sable crew in their loading the wood, I buckled on my revolvers and strolled carelessly up the bank and entered into conversation with the nate.

About thirty or forty yards from us was a dead oak literally covered with wild pigeons. These birds, after they have gorged themselves on acorns, are very tame—often allowing several barrels from a shot gun to be fired among them before they will fly. Calling the mate's attention to these birds, I asked him if he could kill one of them with a revolver. "No; and uary man on yearth kin do it," was the immediate reply. Asking him to pick out a bird for me, he very stullenly said: "That'n pickin' hisself will do." Hardly had he spoken when the identical bird fell headlong to the earth. "Aecident, by G—d!" burst from his pale lips. "Select another," and, as before, the bird felt to an unnerring aim. Two more, and the frightened birds saided in a dark blue column ancres the river. "Now," said I, you know well why I have shot those birds." The trembling limbs, the pallid countenance, and the broken, disjointed utterance but too plainly told that he did know. In the most cheerful manner I assured him that if

iana.

It was on a bright winter morning, then, that pulling aside the blinds of my window, I looked out over the broad waters of a lake that Jay glancing and sparkling in the morning sun. Myriads of wild fowl were disporting broad waters of a lake that lay glancing and sparkling in the morning sun. Myriads of wild fowl were disporting themselves in its waters as if they had never heard the roar of a shot gun. Two pretty little skiffs lay dancing up and down upon the mimic waves, while innumerable batteaux and "dug outs" completed the marine force, or navy of the lake.

Dressing myself, I hastened down stairs, and on the landing below found my uncle, aunt and cousins waiting to greet ne, and make me feel at home. In ten minutes I fett perfectly at home, and I was soon established as ami de maison.

landing below found my uncle, aunt and cousins waiting to greet me, and make me feel at home. In ten minutes I felt perfectly at home, and I was soon established as ami de maison.

My uncle had married, years before, a lady of French extraction. His enreer had been, in old Kentucky, a not infrequent one. Born to immense wealth, fine horses, dogs, guns and cards had absorbed it all, and Uncle Gus woke one fine morning to find himself a ruined man. The Cotton States at that time were the refuge of ruined Kentuckians, whose genial manners, whose general bonhommie made them favorites in every circle. My uncle had resolved upon a new start in life, and as a preliminary had married a French heiress. So well had he prospered, that when I came to Louisiana to spend my winter, he owned three plantations and about two hundred and fifty negroes. I say "about," for what Southerner ever knew his exact number of "nigeers"?

My aunt's father had been a nobleman of the old regime in France, and very stately and proud, yet with what a kind heart let these lines bear withess. Three stalwart sons and two blooming daughters completed the household; the sons, taught in all field sports and French; the daughters, as was usual in the South, taught much more, yet modest and unaffected as children.

Surely, thought I, as I sat down to my first breakfast, "my lines are cast in pleasant places."

A saddle of venison, relic of yesterday's dinner, broiled qual, leease, stewed duck, fried prech, corn cakes and eqfe an latit, made up a most appetizing breakfast to which I did full justice. Here for the first time I saw flowers on the table at breakfast.

I had brought my own gun with me, a Westley-Richards, No. 12, a large guage at that time, a hard hitting, close shooting weapon, superior in all things to the modern breech-loader, except in facility of loading. My cousins had guns of French make, serviceable guns enough, but api to get shaky and unreliable at nore than fifty yards. We spent that day upon the lake and I cm astianed to say ho

who could not have filled his skilf, much less game mag, in a day's shooting. Nowhere in the world can there be found such fine shooting and fishing as can be found in the lakes and bayous of Southern Louisiana. There is something apallingly grand about some of the lakes. Giant cypresses, wreathed to their towering summits with the funeral-looking gray moss, stand like pyramids rather than trees, while the wind waving the moss gives it a fantastic and

weird resemblance at a distance to floating banners, or the sails of great phantom ships gliding along noiselessly far away over the sea. Then the streams, too, dark, secret and mysterious, seem to hold within their prisoned depths of dread secrets, dark, unfathomable, apalling. Then, too, the forms of animal life are as varied as the scenery. Rank upon rank in secried columns stand the roseate spoonbill and the crested crane, melancholy, sedate and silent. Squirrels, black, red and groy, jump from tree to tree and violently scold the intruder upon their domain, long held by prescriptive right; alligators, widely and deceitfully smilling, bask in the saushims upon thousands of decaying logs, or swim along lazily, the tips of their noses just above the water, looking like old stumps or huge links of trees. During this same winter I had an adventure with their alligatorships which nearly cuced me of all desire to hunt them. One fine evening my cousin Herbert, proposed that we should ride over to a lake some miles distant which we had never before visited. Taking our rifles, we were soon speeling our way along to the lake. On our way thither my consin informed me that the alligators in that particular lake, from some cause, were the most ferocions that he had ever seen. There were wild stories afloat among the negroes, he told me, of a cruel planter who made his refractory slaves wade into the lake and light the alligators, by which many of them were killed and eaton. "They certainly have had a taste of man," said Herbert, laughing, "and you must wateh out, for they are the biggest that I have ever seen, and the most of them." Presently we came in sight of the lake, of which, from its very singular appearance, I often dream to this day; Imagine a deep circular basin lower than the lowland around it, containing perhaps a thousand acres.

Not a tree could be seen in the lake, but its leanks were thickly clothed with gigantic, funeral-looking cypresses waving their banners of Spanish moss in the still evening air. Da weird resemblance at a distance to floating banners,

the water into loam, and rising nearean may very acceptanted at mo with hungry, baleful eyes, as it they would like to tear me to pieces, as they did with their wounded companions.

All this made me a little nervous, and having made a shot at one very large, vicious-looking fellow, which only enraged him, while loading my ritle I saw a huge one on the log behind me. Inch by inch the dreadful reptife crept toward me. My hands trembled so that my fingers would not hold the percussion cap which I vainly tried to put on the tube. Another moment, and I would have been in reach of his tail, and would have been swept into the lake to be torn into pieces by the hungry monsters who see thed and boiled at my feet. At this instant the sharp crack of a ridle rang in my ears, and I saw—yes, literally saw the bed strike the monster in the eye, and the next moment he fell deed as a stone from the log. To hurry to the shore, to grasp my cousin's hand, to thank him for my life, released from a death too horrible to contemplate calmly, was but a mement's work. On our way home he told me that when a boy, shooting alligators in this lake, the party had been compelled to desist, for the alligators pursued them on land. From that eventful evening I lost all desire to hunt alligators; and except an occasional shot at one who was too saucy, I contined my shooting during the rest of my stay to legitimate game.

Reared, as I have been, in a country in which the deer had been almost externinated, the number and beauty of these interesting animals was ever a wonder and a joy to the country in my hide, released for the single deer; yet, at the crack of a rifle, you could see many hundreds of heads poering above the tall grass and weeds, seeking to ascertain your exact location.

Well do I remember my first deer hunt. Though every one in that county practised "still" hunting, or stalking, my ousins, Herbert and Robert, had procured a small

wen do I remember my his deer mint. I hong every me in that county practised "still" imming, or statking, my cousins, Herbert and Robert, had procured a small pack of deer hounds of the old Virginia breed, short-legged, dow-lapped, large bodied dogs, whose ancestors had doubtless pulled down many a galkant stag in merry old England.

old England.

Everything having been arranged the evening before, at an unconfortably early hour in the morning you are roused from sweet dreams by a bright light in your eyes, and a gentleman of the African persuasion demands in the tone of a privileged domestic: "Is you gwine deer drivin' dis mawnin'?"

drivin' dis mawnin'??

As a dim remembrance of the enthusiasm of the previous night, stimulated doubtless by my uncle's line claret, dawis upon you, you hurriedly don your shooting jacket and go down. A substantial breakfast, but no stimulates, tor your hand must be steady, to-day, with a wild blast from a hunting bugle, and a chorus of yells from the dogs intermingled with the shrill cries of all the little niggers on the place; with a wild whoop and a sweeping gallop, we are all off to the hunting grounds. Faint streaks of the rosy dawn light up the casternsky as you are posted al your "stand" on the banks of a wide, deep stream, and you are told in a confidential whisper that sometimes as many as twenty deer dash through that place in order to cross the stream calls.

deep stream, and you are told in a confidential whisper that sometimes as many as twenty deer dash through that place in order to cross the stream and get away from the deep monthed thunder that so fiercely and relantlessly pursued them behind. Shivering to your very marrow, for the morning air here is cold, you said town on the good you have done and all the evil; unsatisfactory book-keeping, with the balance on the wrong side; so you stoy that and recall all that you have ever read about deer hunting. "Chevy chase, chevy chase!" the refrain

rings in your ears over and over again like the monoton ous chim for bells. Ha! what lovely gam has full monoton-ous chim for bells. It all what lovely lady was that, clothed in serious of darkest green, who miraculously swept along on her milk white steed on the surface of the river. Ha! you wake with a start and rub your eyes, but instead of the lovely lady there is nothing but the dark rolling

of the lovely lady there is nothing but the dara rooms river.

Hours pass on, the sun mounts high up the heavens, and still no deer. You begin to think that this hunt will be a most unmitigated failure! Hark! faintly borne upon the morning breeze, the dying notes of an organ! While you are wondering what in the world an organ can be playing out here in the wilderness for, you hear a sharp yell of exultation, and in another instant a herd of deer, heads laid back upon their neeks, antlers glancing and waving in the morning sun, burst upon your enchanted sight, and make straight for you. You try to count them, and mentally resolve that the big buck who leads the lierd so gallantly shall fall to your unering aim. Brother sportsmen, doet thou recall the first deer that thou in thy sallow time didst try to shoot? Alas! all remember the ami mentally resolve that the big buck who leads the herd so gallantly shall fall to your unerring aim. Brother sportsmen, dost thou recall the first doer that thou in thy callow time didst try to shoot? Alas! all remember the delicious tingling that runs down your spine and the supernatural coolness with which you cock both barrels and take the most deliberate aim. There is a responsive roar from the good Westley-Hichards, loaded with fifteen buck shot in each barrel, and at twenty yards you speculate how many of the aforesaid shot have riddled that gallant old buck. By St. Bride of Bothwell! there he goes across the river, breasting the tide as though he were amphibious, and you fire the remaining barrel in sheer disperation at alltle fawn who kicks up his heels derisively as the shot go whistling through the branches of the tree over your head! You commence loading, and your fingers twitch so nervously that you cannot cut off the power in the flask! The lack is, you have had a severe attack of "buck ager" and have missed with both barrels. The dogs come up and eye you repronchfully, and at the sound of the horn they dash back and you foad your gun and sit down to severe meditation upon the decirtulness of all things sublumary.

sound of the horn they dash back and you load your gun and sit down to severe meditation upon the deceitfulness of all things sublumary.

The sun mounts higher and higher up the heavens; you fall into a dreamy mood, half waking, half sleeping, when all at once so close that they seem at your very ears the full cry of the pack of the deep-mounted dogs. You are calm now; supernaturally calm, and now as mother herd dashes through the canes, and you glance very full down the land as you select an old buck, the pride of the front. Again the good Westley-Richards responds to your pull, and you have the satisfaction of seeing the old buck turn a complete somersault; and you turn as coolly as in quali shooting to knock over with the second barrel a young "spike" buck, gayly prancing towards the river.

Never again will you have the "buck ager" any more than you would have the "quail ager." You are graduated now, and may perhaps become Emiriths Professor. Your companions rejoin you, a" fer an ummerciful chaffing for having missed the first two, you wend your way home as the evening shadows lengthen, tried, hungry, proud and happy, and so ends your first day's shooting at deer in the "Tuckepaw" country of Louisiana. As one day's shooting is much like another, let me make this one stand for all.

Perhaps in no country in the world could there be found so nuch areadin simulation and the produce of the son such Arcadian simulation and the summer of the son under genuine hospitality and so much Arcadian simulations and the summer of the son under genuine hospitality and so much Arcadian simulations and the summer of the son under genuine hospitality and so much Arcadian simulations and the summer of the summe

may nome as one evening suadows tengthen, tired, hungry, proud and happy, and so ends your first day's shooting at deer in the "Tuckepaw" country of Louisiana. As one day's shooting is much like another, let me make this one stand for all.

Perhaps in no country in the world could there be found so nuch genuine bospitality and so much Arcadian simplicity as could be found in Southern Louisiana. Isolated from the world, these could be in their perfection the simple manners and tastes of which the poets have written so much and of which they knew so little. Old-fashioned honesty, old-fashioned courtesy, and white-handed faith were linked together among these French, these children of parents who know France in her best and worst days: when to be a French gentleman was to lawve a passport to all society; when to be a French gentleman was to lawve a passport to all society in them to be a French persent was to be poor and down-trodden and humble—all this; and these had left their impress upon these people, but in a modified degree. The gentleman had insensibly lost his arrogant, overbearing manners; the peasant his funnible, cringing ways; intermarriage and free intercourse had changed both classes for the better, softening the one and elevating the other.

Fond of innocent amusement, a dance would set all the young people wild with excitement and pleasure. It was a pleasurable sight to see all the younds and all the maidens arrayed in a decorous row, each set occupying for the nonce its own side of the room; and then to see thoold grey-headed negro who played the fiddle, and the younger and less ambitious who played "do bampio," supported by a gayly ribboned tambourine and a "bones," was a sight indeed! Only on gala nights, when there was to be "High Jinks," indeed, did the band muster so strong; on other nights the fiddle and the banjo; "supported by a gayle ribboned tambourine and a "bones," was a sight indeed! Only on gala nights, when there was to be "High Jinks," indeed, did the band muster so strong; on othe

into his eye I saw no assassin there; only an offended

into his eye I saw no assassin there; only an oncomblover, but a gentleman.
"Surely Monsieur does not object to my enjoyment! And himself will say that politeness towards ladies is a very necessary accomplishment; and if the bean see regard him with eyes of favor it is not his fault." In faultiess French, and with the accent on those words that I knew would sting, without a word he left the room and I followed him. There was an open space in front of the house. With hat and coat off, standing in the moonlight, he presented a perfect picture of a man. He did not give me long time to admire the picture, but with head lowered he made a rush at mo to but me, such being the

he presented a perfect picture of a man. He did not give me long time to admire the picture, but with head lowered he made a rush at me to but me, such being the mode of attack among the French Creoles.

Unaccustomed entirely to such a mode of attack, he ran his head into my stomach with such violence that my whole internal arrangements were very much discomposed, and I measured my full length on the ground. With a want of chivalry that I hope was due to defective education, he immediately sprang on me and very unceremoniously commenced pulling my hair and gouging me. To disengage myself from him, to spring to my feet, and get ready for him was but the work of a moment. Again he lowered his head and came at me, but this time I was prepared. To administer a right and left facer, to see him go to grass with a duil, heavy thud, to step aside, and not jump on him, occupied but another moment.

Again and again, and yet again, and the last time the blow is so heavy that my brave foeman lies still and montionless, a heap of black, contrasted with the bright moonlight. At that very time the door opened and my little Rose de Teche came on the scene. To fall across the body of her inanimate lover, to utter scream after scream, and ciell after ciel! was the rather irrational conduct of this little French girl. Soon all the revellers

little Rose de Teche came on the scene. To fall across the body of her inanimate lover, to utter scream after scream, and ciel/after ciel/was the rather irrational conduct of this little French girl. Soon all the revellers made their appearance, and a little cold water having been applied to the prostrate hero he was able to sit up and answer some of the immerable questions that were showered upon him by his sweetheart.

"I fought this gentleman" (pointing to me), "and he krocked me," Assor! "enough."

Four years after, during one of the fiercest battles of the war, I was riding across a portion of the ground over which the fight had been most obstinate. A voice weak and plaintive called my name. Dismounting, I approached a captain of artillery who had been propped against a tree, and so left until the ambulance could come for him. What was my surprise to find in him my quondam foe, whom I had fought on that meonlight night about the Rose de Teche. With a warm grasp of the hand and an enormous drink of apple brandy I left him, for pressing duties called me elsewhere. On inquiry some months afterwards I learned that after losing an arm he had refired from service, to be enfolded in the beauteous arms of the Rose de Teche, whom he married soon after getting home.

NOTES FROM NORTHERN TEXAS.

GAINSVILLE, Tex., Jan., 1880.

If it at was from Denison. A railroad leads from that place to this (40 miles), called the Denison and Pacilic. It stops short at Gainsville, but points bravely toward the Pacilic. When it will reach that sea is one of the uncertain things. This road was built by the energy and capital of one man, Mr. R. S. Stovens, of St. Louis. Finding at last that the job was too big for him, he sold bis road to the Missouri, Kanasa and Texan Railroad at a good round price. That company will extend the road as rapidly as possible still further West. It will pass through a grand country, rapidly filling up with a grand people—acountry of immens fertility—a country in which any man can soon become independent, if he is worth a row of pins. GAINSVILLE, Tex., Jan., 1880

grand people—accounts in which any man can soon become independent, it is in which any man can soon become independent, it is from Deuison here the country is mostly a rolling, "black waxy" prairie, about six hundred feet above the sea, and a belt of timber called the Cross This, but some fifteen miles in width, intervenes. The timber is mostly post oak, and the soil a dark, sandy sort, evidently containing a good deal of iron. The finest stone in this soil is a thin sundstone, filled with iron. A few feet beneath this come the limestones of the prairies. This timber is usually productive—remarkably so in the bottoms; but it is not suitable for wheat. It is also very fine for grapes and fruits, particularly the pear and the peach. Nature has supplied these sandy, timbered lands with an inexhaustible fertilizer of the very kind they most need; but man's labor must apply it. The limestone, which is

grapes and truits, particularly the pear and the leach. Nature has supplied these sandy, timbered lands with an inexhaustible fertilizer of the very kind they most need; but man's labor must apply it. The limestone, which is found everywhere only a few feet under the surface, is soft, containing a good deal of magnesia. This on exposure to the air soon falls into a powder. It is indeed nothing but a very rich marl, and everyone here can get as much of it as he wants at very little expense. I state that this marl stone may be found under the sandy lands everywhere. I state so because I have observed wells at several various parts of the timber belt, and they all show the marl. The black prairies are fine for wheat, as well as cotton, corn and other grains. The population is becoming too dense for stock. Still, every farmer can easily carry a good bunch of cattle, whose milk, butter and heef should add landsomely to his income. Plenty of good land still to be had in this region from §5 upward. Gainsville is an odd stick of a place; population about 3,600, but crowded with people day and might; a great place for saloons, restaurants and jimeracks. It being the terminus of a railroad reaching out into the West, thousands of people come here from the remote frontier to trade, dressed in blouses, broad hats, booted and spurred. They do not look as if they had just jumped out of a bandbox. They would not appear to good advantage in a ball-room on Fifth avenue; yet they are not a bad folk for all that. They are social, hospitable, polite, often very intelligent. They ure not a pleasant people to get into a fuse with, as they don't know any hetter than to hurt somebody when they go to fighting. But there is no need of anybody having a fuse with them unless he cultivates it. Then he can be accommodated in stort order. I have lived with this class of people months and months, and never had anything but pleasant times with them. I am now speaking of the fronterm and the month of the can be accommodated in stort order. I ha tersmen will own properly and have tamines. I do not refer to those graceless vagabonds, the cow-boys. Their company is not desirable, though not half so dangerous as it is usually accredited to be. I see a good many of these cow-boys here, They make things merry some-

times in the drinking-saloons and brothels when they et drunk. As for the citizenship about Gainsville, they re a very good-appearing people, quite as much so a nywhere cise. This whole country is filling up with a ery vigorous people, mainly from Indiana, Illinois, Ken

very vigorous people, mainly from Indiana, Illinois, Kentucky and Missouri.

Met Mr. Geo. H. Ragsdale, who lives here, and whose name is known to many of the readers of Forest and Streem. He went with me on a jaunt over the country to spy out the fauna, diora, soils, etc. The country is generally tertiary, but cretaceous reeds with amuionites often crop out on the hills. The East Trinity, near Gainsville, flows over a vast bed of ammonites and content with a worst analysis. Gainsville, Hows over a vast bed of ammonites and cor-als, Quaid are very abundant, and they are different from those in South Texas, being larger. They are, I think, the Orlya virginianus, whilein South Texas we have the texanus. It is strange that these birds do not pass into the region of each other and internits, but they do not.

the region of each other and intermix, but they do not. Nobody ever saw an Ortye virginianusin South Texas, nor an Ortye texanus in North Texas.

Mr. Ragsdale is devoted to ornithology, and is preparing a work on our Texas birds. He is wasting a good deal of valuable ammunition by writing notes on cruithology for a little paper which probably has not three hundred readers. I tried to persuade him to send his notes to Forest and Stricam, and he promised to send some. He has quite a collection of stutted Texas birds. I learned more from him on the subject of birds than I ever knew before, We had a furious "wet Norther" on us while out, but this did not chill our ardor in the pursuit of science—quem ta Melpongne—but I forbear.

this did not chill our ardor in the pursuicor science—quem tu Melpomen—but I forbear.

In my last I said something of the projection of carboniferous fossils into cretaceous rocks in Texas. Near this place I found many pretty fossils of what I take to be small cycads. I have no books with me, and am not sure whether this fossil plant in other regions rose above the crustaceans, or even so high; yet I find it here im-

the crustaceaus, or even so high; yet I find it here imbedded in tertiary rocks.

Don't think this is much of a fish country. The only fish I have seen here for sale are cats, perch, and suckors, though Mr. Ragsdale tells me the black bass is abundant in East Trinty. Here is something remarkable; how can you account for it? Men who have long lived on it tell fish I have seem though Mr. Ragsdale tells me the management though Mr. Ragsdale tells me the management of the men who have long lived on it tell me there is not a game fish in Red River, and that no man ever caught a game fish in it. Yet whenever the river in an overflow cuts a lake in the bottoms, as it often does, that lake in a short time becomes swarming with black bass. Hundreds are ready to testify to the truth of this. The water of Red River is usually much discolored with sediment. The lakes in the bottoms along its red with sediment.

Alatural Distorp.

DO BLACK SNAKES EAT FISH ?-In discussing this question no little confusion has arisen in the writings of some of our correspondents, not naturalists, who have confounded the true black snake, or racer (Buscanion), with dark forms of other genera, especially Tropidonotus.
We have received a number of communications instancing the capture of fish by the black snake, but almost every case inquiry has shown that it was to the black water snake, and not to the true black snake, that reference was had. An Ohio correspondent, "G. H., has recently given us quite a detailed account of the cap-ture of fish by what was evidently a Tropidonotus,

THE ENGLISH SPARROW POLYGAMOUS .- I am permitted

THE ENGLISH SPARROW POLYGAMOUS.—I am permitted to publish the following extracts from a letter addressed by Mr. Peter Walker to Prof. S. F. Baird:—

"The English sparrows are not a bird that pairs; they approach the domestic fowlin a cock having severalhens, Knapp's difficulty with a pair producing thirteen young was due to his not observing the number of hens in one nest. Bishop Stanley also saw that there was something he could not explain. I have a tree about ten feet from my window, with three boxes into which I can look, inlabited by a cock sparrow with four hens. I put up one lox in 1873, and suspected that the possessor was a bigamist. As the other boxes were put up the male took pessesion with another female. That this has not been observed before, I attribute to the likeness between them being so great. I was never perfectly sure of it till I got them together, but now I see that a flock of sparrows, like a flock of chickins, has a male with several remales."

like a flock of chickins, has a male with several females."

ELIOT COUES.

THE LINNEAN SOCIETY OF NEW YORK.—In the Linnean Society the present winter the interest of previous seasons is maintained and some good work has been accomplished. At recent meetings various papers of interest and value have been read, including the following: Some remarks from a local standpoint on the family Silvicelidae, or American warblers, by Mr. E. P. Bicknoll. In the paper it was shown that to none of the families of birds represented in our immediate neighborhood are we midelted for a greater number of species than to this, Thirty-eight species, including one variety (Dendrocca palmarum palmarum) heretofore unknown from the State, were given as having occurred, seventeen of which have been known to bread. These include such species as Helmilherus vermitrorus, Helmilhophaga pinus, Mylodiotes michalus, Sizura motacilla, Oporomis formosa, and Parda americana. It was stated that in certain localities, in the spring, the songs of the first five of these might be heard at almost the same instant. The local distribution of certain species was also dwelled upon. Migrating species remaining in the spring into Jame were M. Canadensis, G. philatelphia and D. strata. Mr. E. A. Mearns read an installment of a paper on the Patrachains of the Iludson Highlands. A general review of the anatomical characteristics of the class was given, followed by a list of species of the order Raptores, which specie not heir characteristics of the order Raptores, which specied the recent season on Long Island, In. S. D. Osborne read a list of birds of the order Raptores, which specied the recent season on Long Island, in which it was noted that the motified owl, marsh hunk, sharpshinned, coopers, red-shouldered, red-tailed, red-tilled-instants.

long-eared and barred owls, the broad-winged and spar-

long-eared and barred owls, the broad-winged and sparrow hawks, and the white-headed eagle breed rather rarely, while no positive breeding record was given for the short-eared, or Acadian owls.

Mr. L. S. Foster read a list of pirds observed the past season near Cloister, N. J., on the Hackensack River, and at Greenwood Lake. Among these the chewink (Pipilo ergilirophthadmus) was mentioned as having been captured Feb. 22d, 1879. Mr. C. H. Eagle read a paper reviewing our present knowledge of the pallid sparrow (Passerculus princeps), and mentioning the capture of two specimens at Rockaway, L. I., January, 1880. Mr. Eagle, shough recognizing the conspicuous characters of the bird, was inclined to favor the view of its being a variety of P. saurana. Ten specimens of this sparrow are now recorded from Long Island, the most southern point at which it has been detected.

NOTES ON SOME BIRDS BREEDING IN COLORADO.

The following brief notes are from observations made during the season of 1879 in the vicinity of the Goodnight Ranch on the Arkansas River, five miles above Pueblo.

I have included in the list only such species as were actually seen breeding. The number of species resident during the spring and summer in the locality is comparatively small, but the greater part of those breeding are very common :-

Turdus migratorius-Robin : common ; breeds

Mimus polyglottus-Mocking-bird; breeds abundantly usually nests in a cactus or a cedar.

Sialia artica—Arctic blue-bird; a few pairs observed breeding in holes and trees and crevices in the rocks; a nest found April 30th in a hole in the side of a stump was built of grass, and contained five young birds just hatched.

Polioptila carulea-Blue-gray gnat catcher; found a nest in a cedar, June 22d, containing two young and a cow-bird's egg.

Salpinetes obsoletus-Rock wren ; breeds in great num bers in holes in banks and crevices in rocks. found, May 22d, in a hole in a bank, was placed three inches from the entrance, and built of grass lined with horse hair. It contained six eggs.

Dendroeca æstiva-Summer yellowbird; breeds commonly in the river bottom.

Icteria virens, var., longicanda-Long-tailed chat; breeds abundantly. Nests in the low bushes along the river. First nest with eggs taken June 2d; usual number of eggs three-occasionally four.

Hirundo horreorum—Barn swallow; a few seen breed

ing about buildings.

Petrochelidon lunifrons-Eave swallow; breeds in large colonies on the rocky sides of the bluffs along the

river.

Collurio ludovicianus, var., excubitoroides—White-rumped shrike; breeds commonly among the cedars on

rumped surface; been commonly among the certains of the bluffs.

Carpodacus frontulis—Crimson-fronted finch; breeds in great numbers; nests in trees, cacti and old barn swallows nests.

n great numbers; nests in trees, cacti and old barn swallows' nests.

**Chrysomitris psaltriat—Arkansas goldfinch; a few pairs observed breeding; a nest found, June 21st, was about five feet from the ground in the forks of a limb of a small elm. The nest was built of fine grass and weeds, mixed with cottonwood down and lined with the down and fine strips of grapevine bark. It measured two and one-half inches in diameteroutsule; inside, one and three-fourth inches; depth outside, two and one-half inches; inside, one inch; eggs five, similar to those of C. tristia. Sept. 18th 1 found a nest which the young brids were just leaving.

Poocedete gramtineus, var., confines**—Western grass finch; breeds in great numbers. I found one nest in a cactus a foot from the ground, and another in a cedar six feet from the ground, built on top of an old mecking-bird's nest. One set of five eggs taken.

**Gontaphea melanocephala-Black-headed grosbeak; a fow seen breeding.

Cyanospiza amoena—Lazuli finch; breeds abundantly.

Ppillo fuscus—Brown towhee; cenimon resident throughout the year; usually nests in a cactus. One found. Anni 99th was allocat.

Cyanospiza amoena—Lazuii nine; breeds abundantly. Pipilo fuscus—Brown towhie; common resident throughout the year; usually nosts in a cactus. One found, April 29th, was placed in a cavity in the top of a dead cedar eight feet from the ground. Nests built of weeds and grass and lined with hair. Eggs, three; one laid each day until the set is complete.

Agelaeus phemiccus—Red-winged blackbird; breeds in great numbers along the river.

Agelaeus phoniceus—Red-winged blackbird; breeds in great numbers along the river. Icterus bullockii—Bullock's oriole; breeds abaumdantly. Fica hudsonica—American magnle; breeds commonly; usual number of eggs, seven. Tyrannus carolinensis—Kingbird; common; breeds. Tyrannus verticalis—Arkansas flycatcher; great num-

bers breed.

Chordelles virginianus, var., Henryi—Western night-hawk; very common; breeds.

Coccycus americanus—Yellow-billed cuckoo; one nest with two eggs taken.

Melanerpes erghirocephulus—Red-headed woodpecker;

Metaneipes erjanrocephatas—Red-neated woodpecker; rare; only one pair seen breeding.
Colaptes mexicanus—Red-shafted woodpecker; breeds commonly. Took five eggs from a hole April 27th, and May 4th took seven more from the same hole.
Falso sparrerius—Sparrow hawk; common; breeds in holes in trees and crevices in rocks.
Zenaidura carolinensis—Carolina dove; very common;

breeds.

Aegialitis vociferus—Killdeer plover; breeds abundantly in the river bottom.

Ithaco N. Y., Jan. 781, 1880.

HERMAN W. NASH.

MAMES WANTED.—We should be pleased to have the writers who used the following signatures send us their proper names: "W. B.," Sept. 11th, 1879; "Issaquina," Sept. 18th, 1879; "G. G. H., dr.," Aug. 23, 1877; "R. F. C.," Jan. 29th, 1874; "J. F.," Sept. 14th, 1876; "F. S. B.," April 9th, 1874; "C. S. W.," Dec. 16th, 1876.

THE BIRDS OF CHESTER COUNTY, PA

BY B. HARRY WARREN

(Continued)

7d. Dendroica virens. Baird-Black-throated green warbler;

common migrant; arrives May 2d to 10th.
77. D. townsendit, Baird—Townsend's warbler. Of this species in Chester County little is known. Mr. C. D. Wood, of Fhiladelphia, May 12th, 1868, killed near Coatesville, Pa., a male of this species The specimen was sold to Mr. Turnbull, of Philadelphia, and after his death was purchased by Barney Hoopes, Philadelphia. The bird, I have been informed, is now in possession of John Krider, Philadelphia.

78. D. canadensis, Baird-Black-throated blue warbler; com

mon migrant; arrives May 8th to 12th.
79. D. coronala, Gray--Yellow-crowned warbler; common migrant; arrives April 7th to 18th.

grant; arrives April 7th to 18th. \$0. *D. blackburnice*, Baird—Blackburnian warbier; somewhat rare: arrives May 6th to 25th. Mr. William E. Hughes, of Phonixville, Fa., has a nest and three eggs taken in this county. A letter sent me by Mr. Hughes contains the appended mention relative to the find: "The old birds were not shot, but were seen at a very little distance, and there can be no possible mistake."

81 D. castanea, Baird-Bay-breasted warbler; irregularly rare

81. D. castamea, Isand—Isay-preasted waroter; irregularly rare; arrives April 27th to May 18th.—

82. D. pennsylvanica, Baird—Chestnut-sided warbier; arrives May 4th to 18th; nuncrous migrant. I saw two of these birds the 25th of June, 1850; another was observed July 1st. The plumage of the first-mentioned appeared worn. From this fact, as well as the late occurrence, I am inclined to think they occasionally breed here.

83. D. carulea, Baird-Caerulean warbler; rare migrant, a

1991ng may od to 12th. 84. D. striata, Baird—Black-poll warbler; abundant migrant; arrives May 18th to 25th.

85. Dendræca æstiva, Baird-Yellow warbler; common; arrives May 1st to 10th.

86. D. maculosa, Baird—Black and yellow warbler; migrant; irregularly abundant; arrives May 10th to 18th. 87. D. tigrina, Baird—Cape May warbler; rare migrant; arrives

May 6th to 20th. 88. D. palmarum, Baird -Yellow-red poll; abundant migrant; April 20th to 3th.

89. D. superciliosa, Baird -Yellow-throated warbler; very rare

migrant, † 90. D. discolor, Balrd-Prairie warbler; rare migrant, arriving

April 28th to May 7th.

91. Mylodioctes mitratus, Aud. Hooded warbler; tare; May 5th
to 16th.

22. M. pusillus, Bonap.—Green black cap flycatcher; frequent;

arrives May 2d to 12th.

93. M. canadensis, Aud.—Canada flycatcher; common migrant, arriving May 3d to 24th.

arriving May 3d to 24th.

44. Setophaga ruticula, Sw.—Redstart; common migrant; April
24th to Say 10th. If I remember correctly, a nest of this blud was
found and reported in the Forest AND STREAM (date not known)
by a gentleman residing in Kenneth Township, Pa.

55. Pyranga rubra, Vieill—Scarlet tanager; abundant; arrives
April 26th to May 9th; remains as late as Oct. 5th.

56. P. astira, Vieill—Summer red-bird; accidental visitant.

57. Hirunda horrocrum, Barton—Barn swallow; abundant; renches us April 15th to 20th.

reaches us April 1810 to Soun. 98. Hirundo lunifrons, Fay—Cliff swallow; abundant; arrives April 28th to May 3d. 90. H. bicelor, Vieill—White-bellicd swallow; abundant during migration, but not common during the breeding season; arrives April 9th to 15th.

April 16 form.

100. Cotyle riparia, Boie—Sand swallow; abundant, arriving

April 21st to May 4(b. - /

April 21st to May 4th.

Jol. Cotyle scripeumis—Rough-winged swallow; occasional, arriving from April 25th to May 5th. Mr. J. Hoopes Matlack thinks he has found the nest of scripennis in Chester County.

Joy Prome purparea, Boie—Purple martin; abundant; March 21st to April 5th.

Joy Ampels coforoum, Baird—Cedar bird; winter resident; no doubt breeds; gregarious.

Jol. Collyrio berealis, Baird—Butcher bird; winter resident, frelot. Collyrio berealis, Baird—Butcher bird; winter resident, fre-

165, Virco olivacus, Vicili-Red-eyed virco; abundant; arrivos April 19th to May 1st.

-Warbling flycatcher; common in spring 108, V. ailrus, Bonap.

not, ignus, and fall; arrives April 25th to 30th.
107. V. noveboracensis, Bonap.—White-eyed virco; frequent; occurs May 1st to 5th.
108. V. solitarius, Vicill—Blue-headed virco; somewhat scarce;

108. V. solitavius, Vicili—Blue-headed virco; somewhat scarce; arrives April 20th to May 4th.
109. V. flavifrons, Vicili—Vellow-throated virco; common migrant, arriving May 1st to 15th.
110. Minus polyglottus, Boise—Mocking-bird. This species formerly bred in this county, although I have no reason to believe that it does so now. To Mr. Benjamin M. Everhart, a gentleman who has devoted some forty years to the study of the natural history of this section, the writer is indebted for the sudjoined mention of this bird. About 1859 several birds of this species built nests and rearred young, for two or three consecutive years. In thorn bedges, on the property of the Misses Bennett. Having seen the statement that the mocking bird will not breed in confinement. I would say that Mr. Everhart has had them breed repeatefully in explicity.

ment, I wone say that an investment of the depth of the country may be considered as occurring only in the past; even as wandering visitor it has not been seen for years. Nov. 24th, 1879, a specimen (b) was taken on the "Barrens" north of West Chester, but judgling from the somewhat worn full and late occurrace I am forced to think the same an caped captive. 111. Minus carolinensis, Gray—Cathird; abundant; breeds; ar-

111. Minus caronnenses, Ollay School, Technoly Charles, principal de Siste to May Sth. 112. Harporhymchus rufus, Cab—Brown thrush; abundant, breeds; arrives April 2tih to 30th.
113. Thugothorus hadoriclanus, Bonap.—Great Carolina mocking

113. Thrysthorus ludoricianus, Bonap.—Great Caronna mosang wren. Winter resident; not common.

114. *?!.horlckit, Bonap.—Bewick's wren; "very rare."

115. *Cischforus palustris, Cab.—Long-billed marsh wren. "Summer resident; frequent about marshes; insectivorous. Feeds on aquatic insects and others which frequent wet places." (Michener.) This species we have never seen; Vincent Barnard, who lived not very far from Dr. Michener, did not encounter this bird, at least until after 1801, as his catalogue published in that vers did not contain it.

year did not contain it.

116 *C. stallaris, Cab.—Short-billed marsh wren. It has never
been our good fortune to meet with this bird, yet Michener speaks
of it as a "summer resident; frequent." Barnard, however,

states that it is "very rare."
- 117. Troglodytes. adon, Vieill.—House wren; abundant; arrives
April 25th to 35th.
- 118. T. hyemadis, Vieill.—Winter wren; common in winter; ar-

rives Nov. 15th to 30th.

119. Certhia americana, Bonap.—Brown creeper; frequent; win-

to: certain unertenni, Bohap.—Brown ereeper, frequent, wis-ter resident. 120. Sitta carolinensis, Gmelin.—White-bellied nut-hatch; com-

mon resident. 121. S. canadensis. Linn.-Red-bellied nut-batch: rare: winter

121. S. canacansa, Jann.—Red-relined flut-fluter; three; winter resident. I know of but one specimen taken within the confines of Chester County.

122. *Polloptila carulca, Solat.—Blue-gray gnat catcher; April 15th to 25th.

123. Lophophanes bicolor, Bonap.-Tufted titmouse; frequent; esident. 124. *Parus atricapillus*, Linn.—Black-capped titmouse; s

common; resident. 125, *Parus carolinensis, Aud.—Carolina titmouse. I have been

informed that Livingston Hartman, M. D., formerly of this borough, took eggs and specimens of this species near Darlington's

126. Eremophila cornuta, Boie.—Shore lark; winter resident; mewhat common: gregarious 127. Pinicola canadensis, Cab.-Pine grosbeak; rare; winter vis-

123. Carpodacus purpureus, Gray—Purple linch; common; spring migrant; arrives April 15th to May 1st; sometimes winter resi-

129. Chrysomitris tristis. Ronan.-Goldfinch : abundant : resident.

120. C. pinus, Bonap.—Pine inch; rate; winter visitant.
131. Currirestra americana, Wilson—Red crossbill. During severe winters is sometimes seen.

132. C. lercoptera, Wilson-White-wing crossbill; winter visitant;

7 133. Acgiothus linaria, Cab.—Lesser red poll. This species rarely visits us, but when it does is found in large flocks. The writer and a friend, during the winter of '78 and '79, obtained about 150 specimens. For fifteen years prior to this time they had not been seen, at least in any numbers, in this section of the county. Depart in

April. 134. Spizella Monticola, Baird—Tree sparrow; abundant winter 135, S. pusilla, Bonap.—Field sparrow; common; arrives March

28th to April 10th.

136. S. socialis, Bonap.—Chipping sparrow; abundant; arrives April 9th to 22d.

137. Melospiza melodia, Baird-Song sparrow; common rest-

138, + M. lincolnii, Balrd-Lincoln's sparrow: " migratory: ex-

remely rave."

139. M. palustris, Baird - Swamp sparrow; common migrant; not gregarious or resident; arrives April 20th to 30th.

The state of the sparrow; arrives arrives arrives arrives arrives.

140. Passerella iliaca, Swainson Fox-colored sparrow; arrives March 20th to April 5th; abundant during migration.

waren zou to April sin; ubudaan during imgradon. 141. Euspiza americana, Bonao.—Black-throated bunting; rare trrives April 27th to May 7th. I have never known it to breed Michener gives it as a "summer resident; common." Michener gives it as a

142. * E. townsendil, Bonap.—Townsend's bunting; but one speci men known.

Hish Culture.

FISH CULTURE IN CALIFORNIA.

THE fifth biennial report of the Commissioners of Fisheries for the years 1878 and 1879 shows an encouraging progress of the work in California, and an increased public interest in the labors of the Commission. The fishing industries of California are of great magnitude; the wealth of the State is not all locked up in her gold mines. The pages of the report now before us con-tain some instructive statistics of her other sources of revenue; and we have made liberal extracts from this instructive document :-

Since the inception of fish culture in the State onehalf of the annual appropriation has been devoted to the propagation of the salmon (Oncorhynchus quinnat); the number of young fish hatched and turned out into the Sacramento River during that period being 13,150,000. The yearly supply is now 2,500,000, which appears to keep the yield of the river equal to that of former years,

keep the yield of the river equal to that of former years, notwithstanding the increase in the number of sea-lions, protected by law, the increase in the nets and fishermen, and the ercetion of additional canning establishments.

The following table will show the relative catch for hey years during which we have caused statistics to be obtained of salmon caught in the Sacramento and San Joaquin and transported to San Francisco, Sacramento and Stockton:—

Open season Nov. 1st, 1874, to Aug. 1st, 1875. Open season Nov. 1st, 1875, to Aug. 1st, 1876. Open season Nov. 1st, 1876, to Aug. 1st, 1877. Open season Sept. 15th, 1877, to Aug. 1st, 1879. Open season Sept. 15th, 1878, to Aug. 1st, 1879. .5.008,781 lbs. 5,511,400 lbs. 6,493,563 lbs. 6,520,765 lbs. 4,452,550 lbs.

river may be maintained.

The statistics of the canning establishments in California are as follows: Total value of fixtures, including right, canneries, 220 boats, 220 nets, and 120 scow houses, \$374,500. Six hundred men are employed in fishing and 500 more in canning, with a large number of Chinese working. workmen.

The total number of salmon canned in 1878 were about 220,000, value \$263,487; in 1879, 67,523, value \$55,576. In Oregon the salmon fisherics cupley 800 boats and 800

220,000, Yanue \$203,467; in 1870, 61,323, Yanue \$303,56. In Oregon the salmon fisheries employ \$800 boats and \$800 nets to \$35 canneries, with a working force of about 2,000 men, of whom two-thirds are Chinese, the total capital invested being \$1,375,000. In Oregon, British Columbia, and Alaska, the 47 canneries put up in 1878 a total of \$604,570 cases, of which the value was \$3,264,578, and in the year 1870 a total of 468,300 cases, valued at \$2,018,090.

The catch of the season of 1877-8, says the report, was the largest of any since we commenced obtaining statistics, and is in fact the practical result of artificial hatching. Fish hatched in a given year do not begin to show in the zeturns until three or four years after the young fish are placed in the water. After nine years of study and observation, combined with considerable practical experience, we are prepared to answer the question as to the practicability of keeping up the supply of salmon in the Sacramento, notwithstanding the increase of population, extended facilities for transportation, and the multiplication of canning establishments, nets, and fishermen.

nien.

First—There nuns be an honest close season, faithfully observed by the fishermen, to allow a portion of the ripe fish to reach the spawning grounds. This would keep up a normal supply in the river, which normal supply would depend upon the area of clean gravel beds at the sources of the streams over which pure water was passing of a proper temperature. It would also give a supply of fish at the only places where their eggs could be taken for at thicial hatching.

Second—The thousands of sea lions and seals at the Golden Gate and in the bay—carefully protected by legislative enactment—without doubt catch more fish annually than all the pets of the fishermen. These rapacious animals observe neither close season nor Sunday, live wiolly on fish, and are unceasing in their work of destruction. They should be reduced in numbers or driven to some other part of the coast.

Third—A portion of the fish being allowed to reach their spawning grounds, and their destruction by sea lions and sals at the Golden Gate prevented, the number of salmon in this river would depend simply on the amount of meney which the Legislature should deem proper to appropriate for the purpose.

After the female sulmon escapes all her enemies in the love and white soliens at the Golden Gate, the seals in the law and miles of nets in the viver and swims shindly First—There must be an honest close season, faithfully

propriate for the purpose.

After the female salimon escapes all her enemies in the ocean, the sea lions at the Golden Gate, the scals in the bay, and miles of nets in the river, and swims blindly against a stream of more than one hundred miles of muddy water thick with mining sediment, and at last reaches the clean gravel beds of the ice-cold sources of the river to perform the duties of maternity, she is still beset by numerous enemies. In the most favorable streams the areas are not large—having proper beds of gravel, appropriate depth, and the right temperature of water—on which the eggs can be deposited. When the eggs are deposited, observation and experiment have shown that only an average of eight per cent. of them come in contact with the fertilizing sperm of the male—ninety-two per cent, of course, die. This eight per cent, is liable to be destroyed by trout and other rish, or to be snothered by a deposit of sediment caused by heavy rains on the summit of the mountains.

Another formale salmon of the Sacramento will yield \$200 comes to such result in variety the fields, thus a field.

minety-two per cent, of course, die. This eight per cent is liable to be destroyed by trout and other fish, or to be smothered by a deposit of sediment caused by heavy rains on the summit of the mountains.

A mature female salmon of the Sacramento will yield \$60 eggs to each pound in weight of the fish; thus, a fish of 20 pounds will yield 16,000 eggs. It has been estimated that, in a state of nature, not more than two eggs in a thousand ever become fish. This would give the product of the 16,000 eggs, 32 fi.h. By the discoveries in artificial hatching, these 16,000 eggs can be made to produce 15,000 fish. Every egg can be fertilized and kept under control and inspection in the most favorable conditions as to the current, purity, and temperature of the water, shaded from the direct rays of the sun, and closed securely against the almost innumerable finned, winged and furred enemies that are seeking to devour it. The young fish, when they come from the egg, can be kept and fed until the most favorable period for placing them in the river. One million eggs can be taken, focundated, hatched into young salmon, and tured into the river at all expense not to exceed \$1,200, and larger numbers at a less ratio. As they find in the ocean the food upon which they grow and become far, they exhaust nothing from the river; therefore, if some fish are allowed to reach their spawning grounds, the number of salmon in the river can be in proportion to the amount of money the Legislature may see proper to appropriate for their artificial hatching.

Among the other fishes to which attention has been given, are the white fish (Coregonus alba), of which Professor Baird gave nearly one million eggs from Lake Michigan. A discovery of some himper than the river can be in proportion to the amount of money the Legislature may see proper to appropriate for their artificial hatching.

Among the other fishes to which attention has been given, are the white fish (Coregonus alba), of which Professor Baird also sout, in 173, 115,000 young shad

year.

The 74 Schuylkill catfish (Amiurus albidus), imported
from the Raritan River in 1874, and placed in lakes near
Sacrauento, have increased to millions, and now furnish
an immense supply of food. They appear to be equally
at home in the rivers, lakes, brackish sloughs of the title

lands, artificial reservoirs and mill-ponds

lands, artificial reservoirs and mill-ponds.

The value of all the tish of this species, now caught annually and consumed as food, would more than equal the annual appropriation made by the State and placed at the disposal of the Fish Commissioners. This variety of catfish has valuable characteristics, which admirably fit it for wide distribution and for self-preservation in the struggle for existence. The female makes a round nost in the bottom of a pond in which she deposits usually from 3,000 to 5,000 eggs. These are fecundated by the male, who then leaves them to the care of the female. The mother remains over them fanning them with her fins, probably to keep them oxyginated with fresh currents of water, as well as to prevent them being smothered by sediment. She remains in constant attendance, driving away every fish that approaches her nest. In from six to ten days the young make their appearance, ther care does not eease with the birth of the young fish. She now swins alhout them in a circle, keeping them together until all are hatched. When all the young fish as fitted to swim she leads them off to find food, still keeping them in a body by circling about them and driving them the all the young fish as the solutions about them and driving them the other than a direct of the simulations of the find food, still keeping them in a body by circling about them and driving fitted to swim she leads them off to find food, still keeping them in a body by circling about them and driving back wanderers, as a trained shepherd dog drives in a valued right she had been she will at the same time fight any other fish that comes near her charge. In another week or ten day they are prepared to search for their own food, when they gradually disperse. The popular demand for these fish increase as the people learn its adaptability, During the time covered by the report some 39,000 of them have been distributed to public waters.

In January, 1878, we received from the hatching-house, Grand Lake Stream, Maine, 50,000 eggs of the land-locked salmon. As was stated in our last report, the California

During the time covered by the report some 30,000 of them have been distributed to public waters.

In January, 1878, we received from the hatching-house, Grand Lake Stream, Maine, 50,000 eggs of the land-locked salmon. As was stated in our last report, the California salmon (quinnat) has the same characteristics, and readily adapts itself to a life in fresh water. The reservoir of the Spring Valley Water Company, supplying San Francisco with water, and known as San Andreas and Pilarcitos, are well stocked with salmon, the product of those prevented from returning to the ocean by the constructions of the dams. Lake Chabot, the reservoir from which the City of Oakland is supplied with water, is also well stocked by the same means, and from young salmon placed therein. In the winter of 1875-6 a largo number of young salmon were placed in the Truckee River. This river has its rise in Lake Tahoe and flows into Pyramid Lake in Nevada, and has no outlet to the ocean. Some of these salmon are reported to have been taken with the hook in the Truckee River this season, weighing from three and a half to five pounds. The size to which the Sacramento salmon will grow when confined to fresh water depends upon the quantity of food to be found in the lake or stream. A few years after the dam was erected at the San Andreas reservoir salmon were taken, but now do not average to exceed three-fourths of a pound. They now mature their eggs and milt when less than a pound in weight. The land-locked salmon of Maine do not average over six pounds in weight, but they are numeroous in the lakes furnish a large amount of food and yield much sport to the angler, as they readily take both ify and bait. As they are natives of the cold lakes in Maine we have thought the most appropriate places for the distribution of the young fish would be in our mountain lakes; but for purposes of testing their fitness to thrive in the streams from them care also distributed to lakes in the valley and on the coast.

The Eastern trout does not appear to thr

but without doubt it will live in water so warm as to be fatal to Eastern trout. We believe it could be successfully introduced into streams on the Atlantic coast where Eastern trout would not thrive.

This foregoing resume of the report of Messrs, Redding, Throckmorton and Farwell, the competent commissioners, are sufficient to show that California is fully alive to the importance of the preservation of the fishery supply. The work is in capable hands, and is proy supply. The work is in capab essing in a most satisfactory way

gressing in a most satisfactory way.

The Age to Liberate Fry.—Munchester, N. H., Jan. 26th.—Our experience goes to show that the best time to plant out the young fry is as soon as possible after the yolk-sac is fully absorbed. The young fish are then very lively and are moving about in all directions in search of food, and have not got accustomed to being artificially provided for. The young California salmon put into the Pennigawasset at that stage of their existence, in December, 1878, in water almost freezing, seemed to stand the transplantation very well and were plenty and healthy in the river up to August, 1579, since which time noue have been seen, which makes it probable that they returned to salt water the first year instead of remaining in the river two years, as is the case with the Atlantic salmon. We have at different times taken some of the young parr and smelts of the Atlantic salmon which have been artificially hatched and planted, and find them as game as the natives, and the same is true of our oreeding trout which we have in our ponds at the hatching house. We have been very successful in our opera-

tions this season, having taken over 100,000 salunon eggs at Plymouth, from fish which were originally planted in the Femigawasset, and had returned to spawn, and have also taken over 150,000 trout eggs, balf of which are the property of Massachusetts, and the other half will be distributed in various parts of New Hampshire, where the people will protect them till they have grown to a reasonable size. We have also received from Maine 45,000 Penobscot salmon eggs and 50,000 laad-locked salmon eggs, with more of the latter to come. The land-locked eggs will be distributed about the State, and the salmon proper placed in the Penigawasset.

SAMUEL WEBBER.

As a difference of onlino obtains respecting the age

As a difference of opinion obtains respecting the age at which to liberate fry, we ask our readers to supplement the experience of the New Hampshire Commissioner with their own.

GAME AND FISH DIRECTORY.

In sending reports for the Forest and Stream Directory of In scannic roports for the FOREST AND STREAM Directory of Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value: State, Town, Country; means of necess; Hotel and other accommodations; Game and its Season; Fish and its Season; Boats, Guides, etc.; Name of person to address; affort the following model:-

MAINE-Tim Pond, Eustis, Franklin County .- Forty-eight infles MAINE—Tim Pond, Eisslé, Franklin County.—Forty-eight miles north of Farmington. Maine Central Railroad to Farmington; stage to Kingfield and private conveyance twenty-six miles to the farm-house of Kennedy Smith; or, better, private conveyance from Farmington to Smith's. At Tin Pond are four good camps and five boats. Board and use of boat, \$1 per day. Five miles to walk from farm to pond; team ready to haub buggage to camp at reasonable rates. Fich—Trout from May 1st to Oct. 1st. are very plenty. Game—Partridges Sept. 1st to Dec. 1st. Address Kennedy Smith, Eustis, Maine.

ARKANSAS A'Cupport, Jackson County.—Station on St. L. I. M. & S. Kailway, and boat landing on White River. Game—Snipe, plover, quall, ducks, geese, turkeys, swan, deer, beat; twenty-six miles to Swan Lake. Fishing—In river, lakes, and village creek; bass, pickerel, Jack salmon, perch—all sorts—in fact all Southern and Southwestern fresh-water fishes. Hotel—Raifond House,

Southwestern fresh-water fishes. Hotel-Railroad Hou ortensen, proprietor. All facilities. Terms reasonable. P. Morte: ss W. H. Bogart, as above

WHEN TO STRIKE IN FLY-FISHING.

M UCH of the finesse of sportsmanship cannot be taught the novice by written instruction. There are certain indispensable points in the successful practice of the art of fly-fishing which must come to the expert only after long experience and discipline. We may talk of "the twist of the wrist," but to make that twist so neatly and effectively that each repetition of it means a fish hooked is something which must be learned quite independently of the books. There, for instance, is the subject of striking in fly-fishing for trout or grayling, Subject of striking in hy-monoig for front of graying, Veteran anglers who have fished in many of the best twout streams of the land and who have deftly struck the grayling in Michigan and the salmon in the Canadian streams, hold and maintain very different theories on this point, One will tell you that he strikes as soon as he sees the fish move and before he feels the touch. Another claims that the only proper method is to wait until you feel the touch of the fish, and then, by a movement as quick as lightning, fasten him. Our own practice is to strike at sight; we admit that thereby fish may be missed and scared away, which perhaps would be captured if given a little more time; but the number so lost are, we be-lieve, less than the scores of misses made by the contrary practice. As a rule, the fly-fisherman cannot strike too quick. We should be happy to have the experience of some of our readers upon this topic. There will be many weeks to intervene yet before we may actually put theory into practice; and meanwhile it is fitting to compare notes, and by discussion enlighten both ourselves and the novices who are just learning the rudimentary lessons in the school of angling.

The Salmon Sickness.—Fort Omaha, Neb., Jan. 1880.
—Your Oregon correspondent writing on the above subject has left little more to be said. I can vouch for the accuracy of his observations and add a singlar incident which came under my observation, which would seem to prove that man is also liable to sickness from the same cause.

prove that man is also hadne to suchness from the same cause.

I was camping on the head of Bear River, Shoalwater Bay, Washington Tex., with two companions in the month of November. I had heard of the "salmon siekness," as it is called, but did not pay much attention to it. The stream was full of hook-nosed or dog-salmon, ad inferior species which is seldom cuten when fresh, unless during the first run. After remaining in the small tide-water streams several months they become bruised and scarred in the battle of life; and athough I did not then look at them closely, I have no doubt that a microscopic examination would have disclosed the fish fungus which has been so lately discussed in the FOREST AND STREAM, and which may prove to be the real cause of

this curious sickness; and perhaps also explain the mystery of the so-called "moonstruck fish" which had such a run through your columns some time ago. One day, having no game in camp, it was proposed to cook some salmon. We shot several, one of which was immediately cooked and eaten by all. In about a half-hour I started out for a hunt: in a short time I felt faint, dizzy and sick at the stomach. I crawled to the water and bathed my head and wrists, which brought relief and cnabled me to reach camp, but in a condition too weak to hunt more that day. My companions were similarly affected. As we ate nothing else but wholesome bread, it was undoubtedly the fish which made us sick. I afterwards heard of other similar cases and saw several dogs which had been so-poisoned.

W. L. CARPENTER

Salmon Poisoned Doos.—Astoria, Oregon, Jan. 15th.—I saw the communication from your Corvallis correspondent in regard to the salmen poisoning of dogs. I have made inquiries among those whose experience gives weight to their opinions, and these agree substantially as follows: Dogs in Oregon are subject to a very bad disease resembling nistemper, and supposed to be caused by eating fresh blood of the fall salmen. There is no age at which they are particularly liable, an old dog being as sure to be attacked as a puppy. They never have a second attack, and when they recover, they recover entirely. Without treatment they are almost sure to die. Treated in season they nearly all recover. As the principal symptom is an obstinate costiveness, the remedy is a mild physic, repeated as often as may be found necessary. Gunpowder, sulphur and salmon oil have been commonly and successfully used by the early settlers. I have been told by an intelligent settler, an employee of the Hudson's Bay Company, in the early days, that they used to give the blood to their dogs on the arrival of the fish, for the purpose of making them sick. Then after curing them they would feed them on salmon for the rest of the season. He also says he has seen many dead wolves on the banks of streams frequented by fall admon, and supposed they were poisoned by their blood. Exactly what the poisonous principle is would be difficult to determine; it may be as your correspondent suggests—an excess of phosphorons—but that a dead salmon ever shines like "fox-fire" is news to me, though I have walked the beach, bear hunting, at all hours of the night, passing hundreds of them in every stage of odorous decay. I have been told that the only fish they get at Corvallis is the fall salmon. If that is the case, no wonder the dogs are poisoned.

der the dogs are poisoned.

ANOTHER WOODLAND SHANTY.—Ulicat, N. Y., Jan., 1880.—I have just read A. D. C.'s letter and your reply to it. I judge from his going fishing that it is summer when he spends his wacation in the woods, and my own experience for many years has convinced mo that such a cabin as you describe (and I have spent many nights in such a one) is far surpassed for cleanliness and general comfort by an open shanty. My companions and myself have built several within the past eight years first a wigwam, which was rather cramped (although it is the strongest shanty built); then an ordinary open square shanty, which was too low on rainy days, and lastly in 1878 the satisfactory shanty after this manner: Select a slightly sloping situation, where the ground falls say one inch in a foot, with a large rock at the bottom of the slope; about six feet from the rock should be the front of the camp, which faces down hilt: mark out a parallelogram Sx12 feet, the long side parallel to the rock, and on this ground plan lay logs about ten inches in diameter, three logs high, except on the side toward the rock, which side you leave open. Notch the logs deeply when they cross at the corners and slightly on the ends toward the rock, and purt in small cross-pieces to keep them from slipping off one another. At each end of the open side erect crotched poles, say five inches in diameter, and eight and a half feet high, across which lay a cross pole of at least four inness diameter. From this to the back logs lay your rafters and fasten them with birch withes or nails. Cover the top and open triangles at the sides with spruce bark, peeled in pieces five or six feet long three rows will cover the roof), laying them like shingles, the lower layer first. Cover the ground within with balsam houghs, or, if you can find then, with henlock, the smaller the better. Beginning at the back lay them in carefully, with the stems toward the rown and to serve as a sect. Build your fire against the rock, and you have what we call the b

as putting on bay-windows, cupola, etc.

In such a shanty you can put up shelves along the sides and hooks for your guns and poles along the back, sleep confortably with your feet toward the fire, and have a house that you can sit up in, without having one that is dark and gloomy. Neither do you need anything to build it with but an axe and a few nails, and even the latter are not absolutely necessary. I am certain A. D. C. would like such a shanty if he tried one.

EGBERT BAGG, Jr.

The Monnel.

THE HANDLING OF GUN-SHY DOGS.

SEVERAL years ago one of the worst cases of gunshyness we ever saw or heard of attracted our attention, and we watched with great interest the untiring patience of the gentleman, who had adopted a method of his own to accomplish the desired cure. The owner had learned one bitter lesson by experience, and was therefore on his guard when a second gun-shy dog came into his possession. His pride and reputation as a practical sportsman were at stuke, and he did not undertake the task without weighing the system to be adopted in an intelligent and careful manner. The result of his case was a complete success, and we take pleasure in giving to our readers the following letter, in which, at our re-

quest he has kindly consented to dot down his experience, Besides the lessons which it teaches, how to, and how not to, handle a gun-shy dog, it inculcates one thing; it preaches and practices patience; it enforces self-control; it climinates the irascible and it displays the excellence of discipline. We believe that there is no one as well fitted to cure a dog of gun-shyness and timidity as its owner. The subject of the proper handling of gun-shy dogs is understood by few, and every year there are a countless number of excellent, well-nosed does thrust aside and never brought to perfection in the field, simply because the trainer has not the patience, the brains or the tact to rescue the animal from what becomes his ultimate fate—a prowling, sneaking nuisance. We com-mend the following, knowing that it emanates from the long experience of one of Philadelphia's best shots and well-known sportsmen :-

long experience of one of Philadelpha's best shots and well-known sportsmen:—

In giving briefly the result of my experience in breaking gun-shy dogs, I would say, to my knowledge, that on this sabject many sportsmen of education and intelligence adopt the prejudices of ignorant and incompetent dog trainers, who either attempt to overcome what is really a "nervous affection" by the use of rough measures, rendering the ultimate cure of the dog impossible, or else they are the victims of a vulgar superstition that "gun-shyness" is incurable, and that it is but rough justice that a "gun-shy dog" should perish by the gun. Thus many a timid puppy of gentle descent, who in the hands of an intelligent master would have become a renowned hunter, has been condemned to an untimely death before he has enjoyed the rapture of having a gane bird killed over his point, when a little patience and judicious handling would have overcome his timidity and he would have rendered excellent service in the field; for dogs of nervous disposition are noted for their keen powers of sent and careful hunting. A gun-shy pup is rarely found among dogs of low degree but it is generally a conceder fact that it is the result of nervousness and excitability produced by fine breeding. I have certainly cured a gun-shy dog; the very worst sort of a case—a dog who was not only excessively timid by disposition, but who had been so thoroughly frightened by the discharge of fire-arms that the bare appearance of a gun, without even cocking a hammer, filled him with terrible apprehensions and threw limi into a condition of nervous fright from which he would not recover for hours. Defore detailing the process, I would remark, that if proper supervision is taken of the rearing of your pup he will not become gun-sby.

bare appearance of a gru, without even cocking a hamber, filled him with terrible apprehensions and threw him into a condition of nervous tright from which he would not recover for hours. Before detailing the process, I would remark, that if proper supervision is taken of the rearing of your pup he will not become gun-sily. If a pup displays a timid disposition, let him be very gently reared, and let him become gradually accustomed to the gun and to the discharge of very light loads when he is at his meals; or, better still, when pointing game, get some one to stand by and encourage him while you discharge a light load at a distance. If you once avoid his taking a first disagreeable impression you will have no further trouble. After you have induced him to stand until you have downed the first bird, the battle is all over. All that I know on the subject I learned by experience with the first gurs-shy pup I owned. I theorized, I tried an experiment, and it failed; it also resulted in the loss of my pup. I received a present of another gon-shy pup, and hailing the gift as a fortunate opportunity to retrieve my failure, I benefited by my experience, devoted much more time and patience to the task, and succeeded gloriously, though No. 2 was a nuch harder subject to deal with than No. I would have been if properly treated. The blunder I made in the first case was in being too precipitate, and destroying the result of many days work by a rash act. Those of my readers who have read the details of the plucky eacounter between the two most remarkable of English prize-fighters, Jern Macco and Jack King, will remember how Mace, after patiently fighting a waiting fight for two hours, when his adversary was almost blinded, worn out, and the contest practically over, slepped in incuntionsly to deal the coup de grace, and received a fatal left which felled him to the earth and retried him from the fight. My mistake was of this nature. I failed by attempting a finishing stroke, when I had my task almost accomplished. I had bee

Encouraged by my success, in an unluckly moment it occurred to me to demonstrate to the pan by a single illustration the folly of his prejudice against the explosion of gunpowder. Accordingly, one day after extending a kindly greeting to him and fortilying his spirit with some chicken bones, after a short preparatory exercise with light loads, I essayed my coap de grace. I loaded the family pistol with a charge of powder within an inch of the muzzle, and grassing the implement—lock, stock and barrel—with ham fat, so that my pupit should start with an agreable association connected with it, I allowed him to mouth it awhile to further encourage his fancy. Then I seated myself conidentially beside him, and while he was munching a drum-stick I pulled the trigger. A terrific report followed. As the smoke lifted I caught a single glimpse of that brown pup's tail vanishing from the alley gate. I pursued him, but he was out of sight. I never beheld him again, and I did not advertise for him because I felt convinced, after the shock I had given him, his case would be hopeless; so I grow a wiser man on the subject of gun-shy dogs. I mention this illustration to illustrate the care with which one must proceed in dealing with this nervous affection.

The next subject was the dog I now shoot over, a very

The next subject was the dog I now shoot over, a very large black, white and tan setter, cross between Gordon and Laverack, now in his fourth year. When given to me he was just a year old, an overgrown, nervous and thoroughly untutored pup. He did not know a word of command, and he had been thoroughly frightened by having gims discharged over him. A more hopeless case could not well be imagined. The bare sight of a gun terrified him, and he would slink off to the darkest corner he

could find, and lie there keenbling all day, and would not stir for hours, even to take his food. Remembering my experience with the brown pup, I commenced very cautiously. I began my treatment in August, and killed the first birds over him the first of the ensuing November. During nearly three months I gave him his lessen daily. The time occupied did not amount to much—not over a quarter of an hour a day, and it was a pleasure to note the gradual progress that I made. The first step was, of course, to acquire the confidence of the dog, because he was so nervous when I first got him that he was a first of people. I commenced my treatment by bringing the pup into my room before breakfast. I would shut the door, and without paying any attention to bim casually produce my gun, and matantly put it away again, leaving the dog in the room until I was about to go down lown, when I would take him to the garden, feed and encourage him. The next step was to lead him about the yard with a cheek, and carrying the gun on my shculder, and encouraging him with bits of meat. After he had grown accustomed to this I commenced by snapping a single cap, and then feeding and commending him, until he was entirely reassured before I left him; so I added, little by little, until he would stand a light discharge of powder. But I never dispensed with the cheek cord, as I firmly believe if he had once run off and remained in a stalk in his box my work would have been entirely undone. When I had entirely cured him of the terror with which the discharge of a gun at tirst inspired him I took him to a pistol gallery, tied him behind the counter, and instructed the proprietor not to pay any attention to him or allow any one to notice him. I left food for him, and on calling the second day found my pup indifferent to pistol practice. The last of November I took him over to Jersey qual shooting, having of course previously aught him obedience with the check cord, On the hiss bey of birds he exhibited splendid nose and stood like a rock. My righ

—The St. Louis Kennel Club have furnished us with a number of their nicely compiled catalogues, which we will be pleased to distribute, on application, to our friends. The club contemplate making a large exhibit at the New York show this season. We will publish in a short time a full description of the new shooting preserve, recently rented by the club; it is said to contain over eight thousand acres.

eight thousand acres.

ALLIN'S BLUE DOOS.—Winchester, Muss., Dec. 27th, 1879.—Now that the competition for the big hook is drawing to a close there may possibly be room for something else. I am credibly informed that Mr. Ethan Allin, of Pounfert, Com, has among his excellent breed of dogs several that are blue, tan and white. Fag, whose performance in the field is so remarkable, is of this color. I desire to ask if there is any strain of setter known as blue, tan and white, and are there, outside of this kennel, any dogs of that color. I ask because on stating the fact to several breeders of dogs the reply has been that I must be in error, that there are no setters marked so that there are many black, tan and white, but none blue. I have had considerable experience with setters, but do not recollect to have seen any marked with blue. Mr. Allin, who has bred dogs for the last lifty years and knows the pedigree of overy dog that bas coinc under his care, does not understand how this color came into his kennel. One very singular thing about these dogs is that when they are pupe the blue hair, which is in large patches, is much shorter than the white, and the ears, which on the under side are tan color, on the outside are a bluish mouse color, with scarcely any indication of hair. All this is changed, however, as the dog appoaches maturity; the short blue hair equals in length the white and tan, and the ears are clothed in long blue silken tresses. I remember meeting Mr. Allin many years ago at Springfield, and while discussing dogs he remarked that be bred them all colors. That statement was more prophetic than true, for at that time he had no blue in his kennel, Those who have bred emany hirds have often been surprised at the results of crossing different colored birds. Can it be possible that the crossing of a black and white dog with a lemon and white slut would produce the color found on Mr. Allin's dogs?

Dogs marked with patches or spots of a bluish color are not uncommon, and Mr. Allin is not the only owner or breeder of what are called blue dogs in this country. We, however, do not remember of ever having seen a dog that was blue, tan and white, but there is no reason why the phenomenou should not occur, or after persistent and careful crossings for color, be explained in a general way. An article appeared in the Forest and STREAM of Feb. 14th, 1878, particularizing the famous blue Beltons as described by Mr. Edward Laverack in his work entitled "The Setter," from which we condense as follows: The origin of the Belton is not well known, The Marquis of Breadalbane had only Beltons in his ken-There are black and tan Beltons, but blue were preferred. Many years ago, through Cumbuland and Northumberland, England, the breed was known, Mr. Laverack's acquaintance with the breed dated back in 1872 to some forty-seven years before. The color of these dogs was "black or blue and white ticked." Those of our readers who are interested in the crossings and

thereby changing of colors, both of animals and birds, we can refer to no better authority than Mr. Darwin. who, in his work of "Animals under Domestication, treats this subject with his usual masterly skill and care ful research.

Fecundation after Spaying.—New York, Jan. 16th.—In Forest and Stream of last week I corroborated the case of one of your correspondents who spayed a bitch which afterward gave birth to pups; and you suggested that some of the eggs might have descended previous to the operation. This was impossible in my case, as the bitch was only five months old at the time she was spayed. I have since presented the case to Professors T, G. Thomas, J. C. Dalton and J. G. Curtis, and they have all decided that there must have been at least one supplementary ovary. Professor Dalton has notes of two similar cases; one a cat and the other a bitch; the latter having already given birth to two litters of pups, and more expected.

Mark West.

The supplementary ovary is of course quite possible,

The supplementary ovary is of course quite possible, but should be demonstrated before accepted as fact. The authorities quoted are of course good only so far as a good opinion is good. The experimentum crucis is the only reliable evidence.

MR. WM. B. SHATTUC'S KENNEL.—This excellent and admirably managed kennel is in the vicinity of Madisonville, Ohio. fifteen miles to the eastward of Cincinnati. The kennel was designed by the owner, Mr. Shattue, and is a model in its way on account of its practicability. There are eight rooms in all, each 6x6 feet; these are raised a sufficient distance from the ground to prevent all dampness from penetrating through the flooring; they are kept moderately warm, yet perfectly cleanly and well aired. Each room is provided with its own separate yard, 6x10 feet, and what is well worthy of imitation everywhere is, that these yards are covered with gravel and road metal of linestone. This rough surface effectually prevents the softening of the feet which dogs are liable to during the closs season. All of these yards open into a large, well turfled exercising ground enclosed with a paling ten feet high. Of the principal inmates of this kennel, Thorstine is perhaps the best known; a magnificent red frish setter, who is as good as he looks, and shows that he has been handled by a master in the art of dog breaking. Cresar, a dirt colored pointer, a rare one for ruffed grouse, and two couple and a half of splendidly bred little baggles, of which Lee and Lill were prize winners at 8t yours. All of the stock is in the finest condition, which proves that aft. Santtue has adopted an admirable system which he sees is carefully carried out. The dogs are fed wice a day on a stiff, well-cooked mush of Indian meal with the addition of 10 or 15 per cent, of meat—which addition gives the mush a gelatinous consistency; tilferent garden regetables are nized at times with the mush. When the dogs are worked in the field the propertion of meat is increased to 50 per cent, and complete control seems to be varing the proportions and kinds of vegetables cooked with the leads of the stock Mr. WM. B. SHATTUC'S KENNEL. This excellent and

IMPORTED BULL-DOG PUNCH.—Mr. John P. Barnard Jr., Boston, Mass., has imported a full brother to hi bull-bitch Judy. The dog is all white, and a fine one.

Bull Dogs Stolen.—The wood-shed of Mr. Edward MeVey, at Tompkinsville, Staten Island, was entered on the night of Jan. 31st, and a very fine litter of bull-dogs stolen, which were of considerable value to their owners A liberal reward is offered for the return of the puppies

—The Westminster Kennel Club will hold their annual bench show in New York about the end of April; as yet the dutes have not been decided upon. We will furnish full particulars when they are to be announced officially.

Names Claimed,—Lolhair—Mr. James H. Goodsell, of New York City, claims the name of Lothair for his white and lemon ticked English setter dog, by Royal Ben (Carlowitz-Lucy), out of Lady Beaconsfield (Leicester-Orphina); whiched Jan. 10th, 1879; bred by Mr. Edward H. Gillman, Dettoit, Mich.

Medeap and Pliri—Mr. Geo. D. Macdougall, of Montreal, Canada, claims the name of Madcap for his pure black cocker bitch, nine months old, by Mr. E. F. Beards-lee's (Gouveneur, N. Y.) Dan-Bess; also the name of Flirt for all liver-colored bitch, nine-months old, Rolls-Brownie.

for all Inver-colored intent, mne-months on, Rois-Brownie.

Sathro—Mr. Fisher Howe, Jr., of New York City, clainst the name of Sabro for black and white ticked, with black points, pointer puppy, by owner's Rex, out of the late champion bitch Fan (Gillespiels); whelped July 15th,

1879. Neva—Mr. Fisher Howe, Jr., of New York City, claims the name of Neva for black and white ticked with black points, by Strong's Pete, out of Mr. Barker's Princess; whelped Dec. 6th, 1879.

whelped Dec. 6th, 1879.

Bred.—Floss-Rattler—Mr. Reuben Reinsmith's (Allentown, Pa.) bitch Floss (Bismarck-Fanny) to Mr. L. F. Whitman's Llewellin setter dog Rattler, of Forest and Stream Kennel, Detroit, Mich.

Beauty-Chanter—Dr. F. H. Rehwinkel's (Chillicothe, Olio) bengle bitch beauty to Mr. J. H. Stovell's (Philadelphia, Pa.) imported dog Chanter, Jan. 26th.

Lilly-Sensation—Baltimore Kennel Club's Lilly (Guido's) to champion Sensation. Lilly is the dam of Mr. Orgill's Rush, Rose, Belle, etc., by Flake; also of Sefton and the St. Louis Rennel Club's Clytie.

Flaunce II.-Dery.—Baltimore Kennel Club's Flounce II. to same Club's Derg. Flounce II. has never been beaten on the bench, and Mr. Kelly, the club's breaker, proclaims her a rattler in the field. Derg won first al New York, 1879; Philadelphia, 1879, and Boston, 1879, winning every time exhibited.

Imported Mastiff Transs,—Mr. Chas, E. Wallack, of this city, has just received from the kennel of Mr. Rich-ard Alston, Leigh Lodge, Sale, England, a magnificent mastiff puppy bitch seven months old, by Champion Colonel out of Lufra. Colonel was probably the most celebrated and well known show dog in Europe; he died during the early autumn of last year.

-We were recently favored with a call from Mr. B. W. Kilburn, of Littleton, N. H., who has traveled very tensively, with his camera, over America and many for cign countries. He has been in every portion of America. Bermuda, Mexico, France, Switzerland, Germany, Italy, Palestine and Egypt, in order to obtain sterco views from nature. These pictures in artistic merit cannot be surpassed, and the subjects are of rare interest. Being also a veteran sportsman, his views of "The Hunt er's Return," "The Monarch of the Pool," "Caught at Last." and "Walton's Dream, or the Fisherman's Vision." add greatly to the collection.

Answers to Correspondents.

Te Correspondents who may send us their proper name and address will always receive prompt attention in these columns. We require a man's name for two reasons: (1) sometimes as a guarantee of good faith, and (2) always as a matter of common courtesy. As a rule we do not reply to inquiries by mail, except in cases demanding immediate advice.

W. W. P., Kentland, Ind .- Address of paper is New York City.

J. R. Jr., Washington, Pa,-See answer to your question in last

J.T., Altoona, Pa.—For live quait address Mr. E. H. Malley, High Point N. C.

L. G. C., Philadelphia, Pa.-Por ferrets send to Chas. Reiche & Bro . Chatham street, New York,

T. C. H., Elizabethtown, Pa.—You may send your terrapins to Eugene G. Blackford, Fulton Market, New York.

G. L. B., Princess Anne, Md.—We have no scores of the walking matches, nor do we know where you could find them. ASSANPINE, Trenton, N. J.-The name is that of a Philadel-

maker whose work had a good reputation. He is dead now, we believe. IGNORAMUS, Topsham, Mass .- To remove the caps from your

U. M. C. Co.'s shells, get a cap extrastor; an implement made for just this purpose. W. S. W., Haverhill, Mass.—Eugene Bogardus shoots glass balls with rifle at lift. They are thrown up straight from a trap

made specially for the purpose.

H. W., Indiana.—See article headed "The Handling of Gun-Shy lors," in the Kennet Column of this week's paper. It covers the and is eminently practicable.

ground, and is eminently practication.

W. W. R., Eau Golla, Wis.—1. Dr. Carver is in England. 2. Address the paper at Now York. 3. Send your game to Knapp & Van Nostrand, Washington Market, New York.

M. M., Reading, Mich .- The metal ball which rings when struck shot is no longer manufactured; was not a success. You may saibly find one by writing to dealers in sportsmen's goods.

L. G., New York.—Quail should be put out in March or April, if your preserve is in the same climate as New York. It depends somewhat upon the season. They will breed the same year.

B., Pa.—What is meant by the word "blinking," used in connection with a dog? Ans. A "blinker" is a dog that backs off his point and comes "to heel," or ranges away to find other birds.

C. G. S., Emerson, Manitoba.—I. The two kinds of shot are both rood, the choice between them a matter of individual famey. We should advise you to stick to the old powder for best satisfaction.

READER, New York City.—We would advise you to feed your dog, although your puppies may have worms. Give it some arecanut, which you can obtain with directions for use from Corroy, Bisset & Malleson, 65 Fulton street, city.

J. H. A., Marion, Ind.—For English hares we advise you to write to Dr. Chas. Schmidt, East Brunswick, N. J. Ho is about to im-port some. We do not know where to refer you for greyhounds. Possibly some of our readers may tell us.

W. A. B., Montpelier, Vt.-1. Our Chess Column was given up because we could not make room for it. Our field is broad enough without it. 2. We have seen athletes turn triple somersaults, and over the backs of eleven elephants at that.

SUBSCRIBER, Chicago, Ill.-You may use buckshot in a choke-Sobsection, contago, in-Tot ling we because it is another bore with safety, provided you chamber the shot at the choke just within the muzzle. See also the methods of loading buckshot described by correspondents in recent issues.

J. H. M., Mannaroneck, N. Y.—For quall shooting near New York go down to Ocean County, New Jersey. You will find plenty of sport at the Imperial Ledge, six miles from Tom's River, which is registered in our Directory. Write to N. C. Glover, proprietor

F. T. B., Brownsville, Pa.-1. You may subscribe for the paper through the International News Company, Beekman street, New 2. Send to any of our advertisers of fishing tackle for the You can make them yourself with a file, if you exercise a little ingenuity.

—Flour of sulphur, one pound; linseed oil, one gallon; boil until thoroughly combined.

anyroughly command.

S. N. S., Elizabeth, N.J.—1. For Spratt's dog biscuit send to any sun store.

2. The pair of gun sarrels will cost about half the price of the gun. A pair of 12-gauge litted to a 10-gauge gun will eun store. gun store. 2. The pair of 12-gauge litted to a lo-gauge gun will price of the gun. A pair of 12-gauge litted to a lo-gauge gun will make the gun lighter. The cost would be more than it is worth; you might better buy another gun.

you might better buy another gun.

If. C. B., Wausau, Wis.—We do not advise you to lay poison for foxes, unless you are very sure that no dog will find the bait intended for Reynard. For trapping use the spring steel trap, or a dead-fall. Bail with meat and cheese, and take especial pains to leave no human seent. You should handle the trap with gloves.

save no duman scent. Lou snoun hande the trap with gloves. S. S. C., Trenton, Tron.—I have a gun which has been changed from a pin fire to a central fire. Lywait it changed so that It will eject the shell. Please give no the address of a firm that can do the work for me. Ans. Seudyour gun to W. R. Schuefer, Boston Mass., or to Clark & Snelder, Baltimore, Md. Both firms are thoroughly reliable, and will do your work well.

W. W., West Newton, Mass.—1. The gun made in Paris was fair —not of superior material. We should not change it from pin dre to contral fire, but should prefer to buy another gun. 2. The

"Chichester repeating rifle" is nothing but a .22 calibre pistol or dart barrel with a long stock. The arm is simply good for nothing except to be used as a toy. Keep clear of it.

SKIP JACK .- Nail on immediately after steaming. short building; can send if it by our upon receipt of price, \$12.5.

Plants on sides of skip-jack to be worked as wide as possible, and on the long as wide as the plants have been as wide as the plants to be marrower the plants the casier to work, but more labor. About eight-inch wide aumdships and taper as necessary.

W. C., Muskegon, Mich.—Woras in a dog will cause a harsh, staring coat, also denoted by the animal's frequently licking the staring cont, also denoted by the animal's frequently licking the part and dragging himself along in a sitting posture, hence the wearing off of har about the hind quarters. We would suggest thit you give your dog areas nut, two one-half drachin doses, evening and morning, after dog has fasted; followed four hours after by easter oil.

T. H. D., Troy, N. Y.-The extreme accurate range of .32 calibre T. H. D., Troy, N. 1.—The extreme accurate range of secanity established filled with the ordinary factory annumition is considered to be about one hundred yards. The charge of powder is so small in the 32 calibre, and the builet so light, that its accuracy at the longer ranges is very much impaired by the wind and other causes, as compared with the 45 calibre, 70 grains powder, 480 rrains bullet, which is the Government cartridge.

grains build, which is the Government cartridge.

Wooncock, Duxbury, Mass.—Wild rice will grow in Massachusetts if properly planted. It may be put in either in the fall or in the spring. In natural growing the rice ripers and drops down in the fall. The winds and waves then pull up the ods stakes, which float away. The seed should be put into six or eight feet of water. A soft, muddy bottom is indispensable. Next fall you may get seed of Mr. Chas. Gilchrist, Port Hope, Ont.

Post Surgeon,-1. We have made inquiries about the com-Posr Surron.—I. We have made inquiries about the com-pany, and, so far as we can learn, they are now unable to supply orders. Their mistake was in advertising before they were pre-pared. Have not with several subsequent disappointments in se-curing manufactories, etc. 2. The metal ball for trap-shooting is no longer manufactoried. We believe Squires, of this city, has some on hand. He can also supply you with a pair of snowshoes: price, \$6.

W. P. B., Lynn.-We should judge you need a sneak-box. W. P. B., Lyan.—We should judge you need a sneak-box, Write to Richard B. Lanc, Bayville, Ocean County, N. J. Cost \$35. If you want anything cheaper, build a light punt 10ft, long, 3ft, 6in, bean, and about 12in, deep and ships, with camber or reversed sheer to ends, latter about 4in, deep, the bottom rising. Deck over with stout sheeting, varnish thickly and have occlopid with apron in centre. Use white pine, i or fin, thick, How or paddle. Plover in your neighborhood about May 20th, Use No. 8 shorif wild, No. 9 if gentle.

F. E. C., Carleton, N. M.—A., B and Carrec to shoot a match of thre glass balls each for a wager, terms to be first miss and out; that is, of course, the first one missing his ball to be out of the contest. A shoots and misses; B breaks his ball, and C dees like-The next two shots are counts also, but on the third round Wise. The float you show and comes days but not find from B B misses, when C claims the money, according to terms agreed upon. But B objects, saying that C is not cutified to it unless he shoots and breaks his ball, as they must have an equal number of shots. Which is right? Ans. B is right.

JACK, Greenfield, Mass.—I. Your dog is evidently troubled with canker; wash out his cars with springe, using castile soap and topid water, and pour in the cars two or three times a day a small topid water, and pour in the ears two or virce times a day a small quantity of the following solution: Sugar of lead, one screptle, mixed with one ounce of water. To provent the animal from flapping his ears a cap should be placed over the animal's head and tied underneath the threat. Give an aperient, say half an ounce of Epsom sails, in water, once a week, and mix vegetables with dog's dict. 2. Wo will endeavorto look up the pedigree you wish.

dog's diet. 2. We will endeavor to look up the pedigree you wish. Compound, New York.—Fair performance is zibix. coal per H. P. per hour. Above that is poor, under it is excellent. Experience and theory show that the highest bodier pressures are the most economical. It is to high pressure in bodier mainly that the compound cughte owes its supposed superiority. Long stroke single cylinder engines have been built to work nearly as second single cylinder engines have been built to work nearly as second. single cylinder engines have been obtained with noisity as economically with equal totic pressure. The one object of compounding is to prevent condensation due to excessive expansion and lowering of temperature of the steam in long stroke engines. The Perkins boiler carries four hundred or five hundred pounds steam with perfect safety. Is composed of a series of pipes—an improvement on the Herreshoff coil.

provement on the Herreshoff coil.

Howern, Clur, Howell, Mich.—Would a participant for the Bogardus Glass Ball Medal be regarded as a professional? If so, would be be regarded as a professional at any other than glass ball shooting? Ans. No., There are only a few professional shooters in the country, and they are recognized as men who make a livelihood with the gun. In some branches of sport a man who contends for a money prize or with a professional is the web publicled to become a professional. But this is obviously not the case with class ball and piecon shootine. We believe in, so fursa judged to become a professional. Betting 3 obtology for the case with glass bull and bigeon shooting. We believe in, so furas practicable, abolishing money prizes in trap shooting competi-tions. The substitution of other prizes instead clovates the sport and takes from it ils mercenary features.

and takes from it its mercenary features.

B. Concord, Mass.—I. If a full-blooded Irish setter bitch is lined by a buildog and has pups, will she not be liable at any future time, when lined by an Irish setter, to have one or more pupples resembling in some way the buildog? 2. If they did not resemble the buildog in any way could they be called strictly pure blooded Irish setter pupples? 3. Can you give me the names of several good books on the subject of breeding? 4. Over how small a pound does the State of Massachusetts have control? Ans. I, See answer to X. Y. Z. in last week's issue. 2. No. 3. "Stone-lenge on the Dog" contains a chapter on the principles of breeding. Darwin's "Animals under Domestication" is also well worth reading by those who wish to try experimental breeding. I. We have referred this to the Massachusetts Commissioners. ----

To Correspondents,

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good good and the published of the pub

DR. T. M. BREWER.-Our readers will learn with unfeigned sorrow of the death of this well known naturalist at his home in Boston, on the 23d inst. Thomas Mayo Brewer was born in Boston, Nov. 21st, 1814, of a family which had already become noted through the distinguished deeds of his grandfather, Col. James Brewer, who was a prominent revolutionary patriot, and took an active part in the "Boston tea party" of 1778. Graduated at Harvard College in 1835, and in the Medical School in 1838, Dr. Brewer began the practice of a young physician, devoting his leisure to the two seemingly discordant subjects of general politics and ornithology. Having displayed marked ability as a writer, he was induced to enter the newspaper profession, and for many years was known as an influential leader of opinion; and he was subsequently equally active and prominent in the cause of education. To those who may read this brief notice however, Dr. Brewer is best known as an ornithologist. He was one of the young naturalists who were the companions of Audubon, with whom his relations were of the most pleasant nature. The great naturalist honored his Boston friend by naming some new species of birds after him. Shortly before Dr. Brewer's death he had prepared a pleasant paper for one of the monthly magazines, containing copies of several letters which he had received from Audubon. Few of the men who knew Audubon

Dr. Brewer's standing as an ornithologist was very high, and while abroad he everywhere met with a most gratifying reception among the savants of Europe. As a writer upon scientific subjects he has contributed works of much value to American natural history. In 1889 he edited a new edition of Wilson's Ornithology, preparing for it a synopsis of all the North American birds then known. He was the first authority in the country on birds's eggs; the work entitled Oology of North America, written by him in 1856, was a most elaborate publication undertaken by the Smithsonian Institute, but suspended because of its great cost. He wrote much of the biographical portion of the History of North American Birds, prepared in connection with Messrs. Baird and Ridgway and frequently contributed to the monthly magazines, the Nuttall Bulletin, and to the FOREST AND STREAM. His pen had the happy gift of popularizing the subjects treated, and putting them in intelligent form before the general reader. The birds were his friends; when he wrote or talked of their ways, old and young unconsciously became interested, too.

A SHOCKING REVELATION.

ITTLE by little we are gaining an insight into the mode of life and habits of thought of the English sparrow, and, painful as it is to be obliged to acknowledge the fact, it must be confessed that, judged by the morals of the present age, this bird does not appear to be all that he should be. His quarreling and fighting with his comrades, his driving off our native birds from the parks and open places of our city, and the incessant clatter and racket which the sparrow keeps up, might easily enough have been excused or passed over; for the first two eccentricities we could have attributed to a mere effervescence of animal spirits and love for excitement, and the last may be only the sparrow's way of doing what the ornithologists of a past generation used to call hymning his Creator's praise." Yes, these were trifles what well-regulated American mind can refrain from shuddering at the information which we print in another column from Dr. Coues, the well-known friend of the birds, that the sparrow is polygamous. Shocking, indeed, is this news, and scarcely to be believed had it come from any other source. The name by which it is signed, however, compels our unwilling credence. Anything but this could have been pardoned or overlooked, but this is going a little too far. In no well-regulated community can such a state of affairs be tolerated, and we feel sure that Dr. Coues' announcement will cause the anger of each moralist who reads it to burn hot against the daring bird which has brought to the land of the American Eagle, and practices under the Stars and Stripes, such atrocious customs. The friends of the sparrow, if any still remain to him,

may feebly suggest in mitigation of his crimes that we have native birds whose habits in this respect are no better than those of the Passer domesticus. It is indeed true that there are some of our game birds which are very reprehensible in this regard, but they have, at least, sufficient consideration for public feeling to practice their wickedness in secret, withdrawing themselves to the woods and fields, and thus avoiding so far as possible human observation. The sparrow, on the other hand, with insufferable impudence flaunts his immorality before our faces in the most fashionable streets of our crowded cities. Besides, do not most of the readers of FOREST AND STREAM devote, during three months of the year, every day that they can possibly spare to the punishment of these native criminals. The sportsman pursues them with dog and gun, and, we regret to say it, the farmer's boy snares them without mercy. Their carcasses during fall and winter are hung up about our streets-a dreadful warning to evil doers.

But the villainy of the sparrow has not yet been wholly Not satisfied with practicing his devilish arts in this free land, and perchance corrupting the morals of some of our weak-minded native birds, the sparrow is sly. Here he has been in the country some ten or twelve years, and all the time an inhabitant of our cities and exposed to constant observation, yet such is his infernal cunning that up to the present time he had never been detected in his nefarious practices. This is clearly an insult to the intelligence and observation of our ornithologists, and we shall be very much mistaken if they permit it to pass without attempting at least a revenge.

But if the state of things which has just been brought to light affronts and shocks the moral sense of America at large, with what feelings will the news be received in Puritan New England? New England, where offenses of this nature have ever been visited with such terrible penalties; New England, where the man who so far forgot himself as to kiss his wife on Sunday was punished by law ; New England of the Scarlet Letter. Shall Plymouth Rock, hallowed by so many sacred associations, be polluted by customs imported from the barbaric Orient? Shades of the mighty dead, forbid it!

The blood of the descendants of the Pilgrim Fathers will indeed boil with rightcons indignation when this last offence of the sparrows becomes known. Surely from Maine to Connecticut no apologist will benceforth be found for the sparrow, and we may expect that the just wrath of an outraged public sentiment will now at last expel the wicked bird from the land of the forefathers.

In calling this matter to the attention of our readers we are but fulfilling a plain duty, and we feel that we can safely leave the matter to the public to deal with in We are sure that the alarm and horror its own way. with which Dr. Coues' intelligence has been received by us will be shared by all right-mixded people, and that the favor with which the sparrow has hitherto been regarded by a portion of the community must now give place to feelings of condemnation and disgust.

-Col. J. J. Toffey, the Sheriff of Hudson County, N. J., and recently elected President of the New Jersey State Sportsmen's Association is well fitted to fill the latter posi-The Colonel (no fancy title by the way) is an enthusiastic sportsman, an excellent shot and very popular among the boys. 2 Col. Toffey subscribed for the first number of the FOREST AND STREAM,

HOUNDING DEER.

THERE is no good reason to warrant or excuse the continued existence upon our statute books of laws which are ostensibly designed to regulate the killing of deer, but which in reality give to self-styled "sportsman" and market hunter full license to slaughter and exterminate. Possibly the most effective agency in producing such laws is the ignorance of legislators who frame them. All that the law-makers know-or think they knowabout deer, is what others, who profess to be informed, tell them; and if this information be of an inadequate or purposely false character, improper legislation is the result.

The question of hounding vs. still hunting is one of periodical and spasmodic recurrence at our State capitals. If the merits of the case were set forth by the advocates of each method, and so thoroughly and fully that dispassionate and disinterested men could draw therefrom their own conclusions, we should thereby have advanced a step toward the proper solution of this vexed subject. We have undertaken to secure such a comprehensive presentation of the question. Without at present taking issue on either side we have requested those interested to present their own case in the shape of replies to the follow ing questions. As our circulars may not have reached some whose knowledge and long experience enable them to give testimony worthy of consideration, we invite them now to respond. The subject is one of sufficient importance to merit careful consideration.

So soon as it may be practicable we shall publish a full summary of the correspondence. Game societies and all others interested in securing sound game legislation will find of most efficient service the FOREST AND STREAM material thus collected. The points upon which we have asked our correspondents to give their personal knowledge and opinion are these :-

1st. What is the character of the country referred to?

2d. What is the prevailing method of buuting deer?

3d. Describe, from your own knowledge, hounding deer and its ffects. Does it drive deer out of the country?

4th. Describe in like manner the practice of still-hunting. 5th. What class of men kill the most deer?-market hunters or

parties of sportsmen ?—residents or non-residents?

oth. Wouldyou approve of a law prohibiting hounding deer? 7th Would you approve of a law permitting bounding, but pro-

thibiting the killing or capturing of the deer after it has been into the water? Would such a law be practicable? sth. What is the open season for deer? Do you approve of it? If not, why? How would you alter it?

9th. What are the winter habits of deer, so far as you have per-

10th. Add anything else you may think pertinent to the discus-

THE VALUE OF NAVAL DESIGN.

IN a recent issue, a correspondent, "Corinthian," to whom we are obliged for more than one interesting and tersely put article from the standpoint of the orthodox believers in beam and "practical" talent, takes exception altogether to the application of naval science to the designing of vessels, and yachts more in particular. As we know similar views to be in vogue among a large fraction of the public, these few lines will possibly serve to cause them to reconsider what is generally a too hasty assumption and a too radical conclusion on their part.

The argument advanced by "Corinthian" is exactly what all others of his way of thinking invariably fall back upon when trying to support their side of the question. But we are not prepared to admit that his argument will stand the application of fact or logic. In the first place we are unwilling to acknowledge that all the yachts turned out by famous builders of "natural intuition" are either fast or a success. On the contrary, most of the popular builders have launched monstrosities and failures about as often as they have been fortunate in hitting blindly upon the right thing. We have no desire to be invidious in these remarks, and must ask "Corinthian" and others to recall the list of yachts built or modeled by the gifted who work by inspiration and not by reason—as our correspondent claims—and they cannot fail to acknowledge the truth of these words. selves, we are not disposed to grant anything in the way of inspiration, but think that even the most popular and successful builders are engaged in solving by experiment and logic the complicated problems of design after their own fashion. Moreover, enjoying a pretty intimate acquaintance with many builders, we may add that in so far as they have reached definite and unassailable conclusions, they will always be found to closely coincide in the results of their reasoning or experimenting with the pre-scribed laws of modern naval science. On the contrary, on those points where their logic is open to criticism, we find that builders disagree so radically among themselves, that the only inference to be drawn is that their success cannot be assigned to any assumed or supposed knowledge or familiarity with the true laws of naval science, but their fast vessels are to be attributed rather to a faithful and comprehensive eye and a mind well developed for the dissection and retention of "sweet

looking forms. These they incorporate in their models in practice with more or less success, and in proportion as they surpass others in this capacity of mind and eye, they produce results better than those of individuals less fortunately endowed by nature. This is all there is to their success, and in no way vitiates or modifies either the correctness or the utility of naval design.

To put the value of the latter in a clear and impregnable light is an easy matter, "Corinthian" claims that builders of fast yachts are "born," that study of the problems involved are superfluous. But great artists are also "born." The great masters, the queens of song and the skillful fashioners of clay, are not the product of much despised "book-learning," but the favorites richly endowed by nature; yet "Corinthian" would hardly, on that account, think less of studying the laws of perspective, give up practice with his brush, or refuse the benefits of the methodical pursuit of music to his children. If by such means they cannot be molded into artists of the highest rank, they can at least be made to comprehend, to value, to copy or to approach the great works held up to them as models, and be thereby lifted far above the level of the "common herd."

If great naval architects are "born"—for argument let it be so—it is perfectly idle to decry the investigation of the elements of their success, and it is these which the naval architect examines into and lays bare before the world, if possible, so that all may benefit by positive knowledge, and no longer travel in leading strings or be submissive subjects to the black arts of mystification with which yacht builders are so prone to enshroud their work—something which in the end they may be less able to explain than members of the lay public incapable of producing a model equally as fast or able.

Besides, half a dozen successful yacht builders, stretched out over half a century, is not a very heavy crop of "inborn talent" for the public to depend The yachts of really admirable performances hardly exceed one in fifty, and it is beyond doubt that the proportion would be much more favorable were the principles of naval architecture better understood and not so hastily thrown overboard at the occasional lucky strikes of jackknife art. It is comparatively an easy matter, after long experience with a certain type of vossel, to design or whittle out satisfactory craft of very similar dimensions and form, and for such work the necessity of theoretical knowledge may not be very pressing, for the effects of slight variations can guessed at beforehand with some approach to truth. But let the builders who depend upon "instinct" once sheer off the well-marked course, and they are only too glad to grasp at any formula, any figures, anything "from authority," as the drowning man grasps after a straw. To suppose that structures differing so radically from the normal as a Poppoffka ironclad, a Devastation monitor, a Czar's elliptic yacht, a Seabelle, or Jullanar, could have been made such complete successes upon the mere guesswork of a "smart" individual, is sheer nonsense. such works the methodical knowledge of a naval architect becomes invaluable, and iu a lesser degree the same holds good in the modeling of craft of a moderate tonnage, be they yachts, smacks, or launches.

On the whole, if there are cases where the world is happier without knowledge, it cannot be denied that the more we know the better. We fail to see that the opponents of scientific design have scored a point in favor of intuitive talent, precarious enough at all times, but think that if naval science has not yet reached perfection from a theoretical point of view the more all hands pull together the sconer will the science be reduced to a shape suitable for every-day application.

SOLDIER, SPORTSMAN AND NATURALIST,-We had a most pleasant call last week from Capt. Chas. A. Bendire, whose name is familiar to old and new readers of this Capt. Bendire's command is at Fort Walla Walla, Washington Territory, whence he has come East to undergo a surgical operation; meantime he is visiting the museums of natural history and noting the advance in the several collections with which he is familiar. Much of a sportsman and more of a naturalist. Cant. Bendire has, during his twenty-five years of service on the frontier, enjoyed most favorable opportunities for indulging his tastes. The sections of country in which he has been stationed from time to time have been rich in scientific material, and more than one museum of natural history has been enriched with specimens sent from his post. Special attention has been given by him to ornithology and oölogy. His collection of American birds' eggs is very complete, and is probably unequaled by any other private collection in the country. On his present trin Capt. Bendire brings to the National Museum of Washington five specimens of fishes, of which one is the "red-fish," and three others are entirely new. Concerning the "red-fish," a memorandum from those who have had the task of classifying it places it as the Salma kinnerlyi (Gill and Jordan), or red trout, first discovered by Dr. Kinnerly, in Chilowequick Lake, near the Frazer River, in August, 1859, and first described by Dr. Geo, Luckley in the "Annals of the Lyceum of Natural History," New York, VII, 1861, p. 367; full description

1872-3. The specimen, however, sent by Capt. Bendirs was quite a revelation as to the size of the species, being three times as large as the others. Both were caught in the same month of the year, October, and while distinctly disclaiming any disposition to dispute the classification, the Captain thinks that his fish is a different one from the specimen examined in the Smithsonian.

Volume Fourteen.—We begin to-day a new volume, and as it has been for thousands of years the pleasant custom of men to mark the completion of one stage of life's journey and the entrance upon another by some token of good cheer, we have thought it fitting to express our good feeling at this time by some substantial evidence of satisfaction. Putting this into shape we appear with several of our departments in smaller type than heretofore. That means more matter in the same space. It is a change which will enable us to treat more satisfactorily the soveral departments of our field, and we shall take great pains in the future as in the past to put into the space accorded each department the very best material attainable.

As the years are advancing, and one volume succeeds another, we are reminded to impress upon the reader the value of the books thus formed. The file of the Formest and Stream since its beginning is a vast library of entertainment and instruction. The numbers which make up a volume are well worth preserving and binding. The novice will find in the pages of such a journal full and explicit instruction upon every branch of the sportsman's craft. Several treatises upon game, gunsfishes and fishing might be compiled from its columns; and most admirable books of travel might be made up from the sketches of its contributors.

Notes.—In striking contrast to the dashing and foaming rapids of Maine, St. Clair pictures the weird and funereal scene of a sluggish Louisiana swamp, where cypress trees, hung with Southern moss, are reflected from the dark waters of the alligator's home. "A Winter in Louisiana" has much romance and much strange adventure about it. Many of our readers will turn from its perusal back to the days of their own personal experience before the war. This is one of those sketches which reveal to us—or rather suggest—the wealth of entertaining sporting reminiscences stored up by our friends at the South. We could wish that St. Clair's pen might stimulate others to recall for our readers their tales of Southern sporta quarter of a century ago.

The Arcadians of Southern Louisiana have not changed since the day St. Clair kissed the Rose de Teche. The stranger finds them still the same simple, quaint people, preserving their odd prejudices and primitive customs. They are aside from the current—off in an eddy of the stream, where the flow does not disturb them.

We can put ever so many of the countries of Europe into the single State of Texas, and have room for one or two Eastern States beside. Our correspondent, N. A. T., has the happy faculty of seeing scores of interesting things in the great State which he has made his own, and this faculty he supplements with another equally felicitous—that of describing what he sees. The fish problem he propounds at the close of his letter is one that will nuzzle icthyologists.

Among those who called at the Forest and Stream office this week was Mr. Charles Gilchrist, of Port Hope, Ontario, who, many of our readers will be pleased to learn has made arrangements with the Indians of Rice Lake to secure next fall a full supply of wild rice. The gathering of this cereal in Canada is reserved to the Indians, white men being forbidden to collect it. Mr. Gilchrist has already been very successful in securing from his Indian agents large supplies of rice, which he has shipped to all parts of this country, as well as to England and Scotland The Indians go out in canoes through the rice patches, the man at the bow and the squaw at the stern, with two sticks or poles about three feet in length, with one of which the rice is drawn alternately from one side and then from the other over the canoe, while the other stick is used as a flail to beat the seed out into the boat,

If the responses are any indication, our colored pictorial posters must be accomplishing their mission in a highly satisfactory manner. We still have a full supply on hand, and shall be pleased to send them to all who may be inclined to post them where they may be seen and read. Attention is called to the prospectus of our commissions and prizes, as given elsowhere.

In response to several inquiries we may explain that we do not propose to publish a game and fish directory in book form. Such an undertaking would be futile, because of the constant change in game localities. Our plan, which we are now carrying into effect, is to secure all information of a useful character relating to fish and game resorts, to register such notes in a book here, and in turn give it to such of our readers as may wish to avail themselves of it. Comprehensively stating the case, we

propose to act as a medium for the interchange of information. We have been led to this by having long known the needs of gentlemen sportsmen, and have, after mature deliberation, adopted this as the most feasible and satisfactory method of supplying this want. That the directory to sportsmen's resorts may be of the most complete and valuable scope we cordially invite the active cooperation of every man who may be able to help us by his contribution.

The Bay County Sportsman's Association gave a banquetin honor of the State Sportsman's Association, at the Fraser House, Bay City, Mich., last evening. We were there in spirit, and only wish we could have materialized ourselves into tangible form to participate in the festivities.

"Is fish culture a success?" This question is not asked now as it was a few years ago. We are finding auswers to it on all sides. To-day we publish a most emphatic and favorable reply in the report of the California Commissioners.

Anything coming from the pen of Mr. A. Cary Smith will be read with much interest and attention by all. The long experience of Mr. Smith in practical building and in the designing of numerous yachts of all tonnages, as well as the mass of statistics it has been his good fortune to accumulate during his long service as Measurer of the N. Y. Y. C. and S. Y. C., entitle him to speak as an authority upon all matters connected with vachting. We welcome his name to our columns, and know that the public at large share our pleasure in seeing his ideas in print. The very instructive lectures delivered by Mr. Smith before the Seawanhaka Y. C. form, as we know, a standard which governs the modeling of most of the yacht builders in America to a larger extent than any other source of information. As the question of measurement has more bearing upon the future models of both America and England than is generally supposed, we propose to give it all the consideration its importance de-

We have long since been satisfied that the importance of the protection of game from its natural exterminators in the animal world has not been sufficiently recognized. Some sportsmen's associations have offered prizes for the greatest numbers of vermin killed; among such clubs, that of Luzerne County, Pa., is conspicuous. Foxes, weazels, skunks, owls, hawks and all the pestiferous class of preying animals and birds destroy more game each season than the poachers and lawless gunnors and trappers. Foxes are reported very abundant this year in certain sections of New England and the Middle States. Sportsmen in those same sections may, as the result, look for a scarcity of game birds.

CRICKET CLUB MEETINGS .- The annual meeting of the Staten Island Cricket Club was held at Delmonico's, Broad street, on the 2d inst. The following Board of Directors was elected to serve for the ensuing year: Mr. William Krebs, President; Mr. E. Wiman, dent; Mr. E. H. Outerbridge, Secretary, 23 South street; Mr. W. M. Betts, Treasurer, 87 Leonard street; Messrs. William M. Donald, R. B. Whittemore, E. W. Stevens, W. H. Davidge and Ashton Harvey. The late Secretary, Mr. W. H. Davidge, read his annual report, the pith of which, including the club's averages, have already been published in the Forest and Stream's cricket columns. The Treasurer's report showed the club's income for last year to have been \$2,701.52. This does not include the gate money received from the Irish and English matches. After paying all expenses there is left a handsome balance in bank. The vote on the amendment to prohibit members who are also members of other organizations from playing against the club in matches was carried by a two-thirds vote. The clause does not apply to college, school or commercial elevens. This reform was much needed, not only to stamp the club's individuality, but also to protect one or two kindred organizations in this vicinity. The chair was instructed to appoint a committee of five to revise the present constitution and by-laws, and it wisely suggested that the captains of both elevens are to be elected by the elevens, and not selected by the committee, as heretofore. The new mode will commit, as it were, each player to his choice, and will give less opportunity to "kick." A large number of new members were elected, and the propriety of building a new club house is in serious contemplation.

The St. George's Club had their meeting at Delmonico's, Twenty-sixth street, on the 2d inst. The following officers were elected for the current year: President, Mr. J. T. Soutter; Vice-President, Mr. G. T. Green; Treasurer, Mr. B. Mostyn; Secretary, Mr. G. Hyde-Clarke; Committee, Messrs. E. H. Moeran, C. W. Bance, David B. Gilbert, T. C. Richardson and J. P. Conover. The suggestion to divide the club's ground at Heboken with the Columbia College Club has been referred to a special committee. The Secretary's and Treasurer's reports were both read and adopted; and the club trust this year to play several out-of-town matches.

GAME PROTECTION.

MIGRATORY QUAIL IN GEORGIA.—An Atlanta correspondent sends us the following note from the Thomas ville (Ga.). Times, the first recognition he has seen of the presence of the birds in that section :-

presence of the birds in that section:—

Mr. J. M. Blackshear caught and sent to town the other day, for the inspection of his friends, a dwarf quail. The bird appeared on Mr. Blackshear's plantation last year. It is a beautiful, symmetrical bird, and is very highly prized by sportsmen. The Forest and Streem gives in a recent issue, an interesting account of their introduction into this country. They are called the Messian quail, and are migratory in their nature. During the past few years several thousand have been imported from Messian by Eastern and Northern sportsmen. None, so far as we know, have been sent South, and how the little stranger found his way down here is a mystery.

THE NEW JERSEY WOODCOCK LAW.

Morristown, N. J., Jan. 31st Editor Parest and Stream:—There seems evident a strong disposition on the part of some of our Jersey men to oppose the efforts of the Protective Gume Association from procuring proper legislation. All this is beyond my comprehension. If I am not mistaken, the main cause of this outbreak is the proposed abolition of summer cock-shooting. Now, it is my firm bother that the out of ten of the sportsmen of New Jorsey are in favor of a law prohibiting summer shooting. Are the wishes of nine sportsmen to be set askide for the unit? By reference to the records of the Senate, I had that the bill for the amendment of the game laws was introduced by Senator Lawrence of Sussex County. If there is a man in the State of New Jersey who is more competent to say whether summer shooting is exterminating the woodcook than Senator Lawrence I have yet to hear of him. Mr. Lawrence wasborn and brought up near what were formerly the greatest woodcock grounds in the Middle States, the Drowned Lands of whosenees grounds in the John States, the Dymical Lades Sussex and Dymical Lades Sussex and Sussex and France Counties. No one will deny that where there are up to the others are the two or three londs on. Therefore, I say, If the woodcook are constantly Georgishing under the present law, let us try to better their could not by the enactment of a more stringent one. Note their could ion by the cancerment of a more stringent one. Now, upon what grounds do the opponents of the reform hase their objection? Thear them say, "We will not have any shooting if the proposed now haw is passed?" Let me ask a question. How many woodcock will the sportsmen get if such an alteration is not made? But it is not, my brother sportsmen, a question of how many woodcock you will cer, but how many there will be. The clamor of the country is for the farmers to rally and defeat

the bill.

What possible benefit the farmer derives from summer shoot
ing is unknown to the yeomanry of New Jersey. As the woodcock of this State is an inoffensive little fellow, and never damages the summer crop to any appreciable extent, he cannot be ages in a summer copy to day appreciator activity of our farmers do not revel in woodcock shooting I fall to see the occasion for this hue and cry. Trusting that the present session of our Legislature will give us a law which will improve the shooting in this State, I am, yours in the interest of true sport.

in the interest of true sport.

There is nothing astonishing in the fact that the New Jersey summer woodcock bill should have its antagonists, for its opponents are mostly found on examination to be either seithly persons celling themselves sportsmen, or else villationary bad shots. The former, as a class, are the most difficult to deal with: they would blindly kill the goose that hays the golden egg, reasoning that as life is uncertain they might not be spared to be in at the that as the is uncertain they might not be sparred to be in at the cackling. The other class are easily sorted out and readily also posed of. It would be well to have a special act passed in their behirft, allowing them the privilege of blazing away whenever the spirit moves them. For Heaven knows it would only keep our I lend, the woodcock, in good Bying trim, for woodcock are

GAME IN SUASON IN FEBRUARY.

GAME AND FISH DIRECTORY.

In sending reports for the Forest and Stream Directory to Game and Fish Resolts, our correspondents are requested to give the following particulars, with such other information as they may deem of value; State, Town, County means of access; Hotel and other accommodations; Game and its Season; Fish and its Season; Boats, Guides, etc.; Name of person to address ;- after the following model :-

ARKANSAS-Clinton, Van Buren County,-Little Rock and Fort Smith Railway to Chimmers, from thence by wagon. Turkey, deer, bear in greater abundance than elsewhere in the State. No deer, ocar in greater additioner than essewhere in the State. No canebrakes. From here its easy to go to Sugat Loaf, Peter Creok, Owl's Cove, "Big Bottom," Greasy Valley, the "Meadows," the "Gourd," Det il's Fork, "Possum Walk, the "Gulf," and several than desirable values. other desirable places. Country wild and mountainous; people friendly and obliging. Hotel-Hartwell Greeson, proprietor; \$1 Address Richard Poe, Esq., as above

-Mr. E. M. Messenger, of the Bromfield House, Boston Mass., with a party of four others, has gone to North Carolina, where he will spend some weeks quail shooting.

-The cariboo, Cervus tarandus, is seldom seen in New York City, in fact, not over twenty have ever been shipped to this market. It was our good fortune, however, to inspect, yesterday, at the restaurant of Mr. John Suther land in Liberty street, two magnificent specimens, a bull and a cow. They were shot by an Indian in the neighborhood of the Revière Dupont, Canada, and described by him as "nice fat," each deer having weighed in life over 350 pounds.

THE RIVINGTON GUN AND RIFLE CLUB,-The annual meeting of the club, formerly known as the Social Gun and Rifle Club of Philadelphia convened Jan. 3 17th, at the Union League Club, when the name was changed to the Rivington Gun and Rifle Club of Philadelphia. No doubt under the new title the members will acquit themselves individually as creditably as they did under the old name.

The reports at the annual meeting were of the most satisfactory nature; the membership numbers sixty-eight, and the club has no debt, with a balance in the treasury, That the meetings meant something last year will be learned from the following summary taken from the shooting record for 1879, and sent to us by a correspond-

cnt:—
The chib gives an annual prize for the best score made at 40 birds from 5 traps, handleap rise. This was won by the score of 37 killed, the winner standing at 30 vards. The next best were 4 of 35 killed, 1 of 34, 3 of 33, efc.

Number of members who took part in these contests, 34; largest number in any one match, 21; total number of birds shot at in matches for above prize, was 1,221; killed, 871; hissed, 350; percentage killed, 71½; highest percentage in any natch, 81; lowest percentage in any match, 63; number of clean scores of ten "straight," 7; highest individual score in four monthly matches, 37 out of 40, or 92‡ per cent.

1000 to 102 per cent.

Besides the above we have had a great many matches for other prizes, all of which were well attended, as you

Besides the above we have had a great many matches for other prizes, all of which were well attended, as you may judge from the following record:—

Total number of birds shot at on the club*grounds during the year 1879, was 7,481; killed, 5,337; 'missed, 2,141, Per cent. killed, 71½, or, omitting double bird shooting.

73 per cent.
We also gave a prize for glass ball shooting from three
Bogardus traps, 18 yards rise, won by the score of 76
breken out of 80. Excluding rille shooting, we find there
were about 16,000 shots fired upon the grounds during the

NEW YORK STATE SPORTSMEN'S ASSOCIATION.-The Seneca Falls Reveille gives the following encouraging report of the preparations for the next convention of the Association, which will be held there :-

report of the preparations for the next convention of the Association, which will be held there:

It having been decided to hold the annual shoot of the State Sportsmen's Association under the auspices of the Seneca Gun Club of this village, preparations are being made for the largest and most successful gathering of the kind ever witnessed in the State. Neither time nor expense will be spared in promoting the objects of the Association. The generous hospitality of our citizens will be extended to all members of the Association who may gather here during their annual tourney, and all our sportsmen will vie with each other in the magnanmity of their efforts to make the convention a gratifying success. We hope for the attendance of an unusually large number of the sportsmen of the State. They may be assured that the occasion will be one of profit and of pleasure. Our home sportsmen to whom were entrusted the cares and responsibilities of the convention of 1872, and who managed it so successfully and satisfactorily, will have the coming convention in charge. The Seneca Gun Clubwhich embraces within its membership such well-known names as Silsby, Hoag, Lawrence, Stacey, Parrish, Tubbs, Ten Byck, Niver, Selleck, as well as many others—will omit nothing in its efforts to make the coming convention worthy of the highest commendation. The prizes which it will offer for competing shots will surpass those of any other meeting. They will be numerous, valuable and worthy of the sharpest contests. Alverdy arrangements have been perfected for obtaining birds in great numbers, and there will be no delay because of any neglect in this respect. The convention will be held at an opportune time, and all our citizens will feel it incumbent upon them to contribute in every way possible toward making it a credit to our village and an honor to the Association.

Vermont Fox Hunting.—Pittsford, Rutland Co., Vt.
—Jan. 37th.—In issue of Jan. 15th I notice an account
of a New Hampshire fox hunt, in which the parties bagged two foxes in one day. It is not unusual for fox
hunters in our town to bag two foxes in a day's hunt. A
few weeks since, Mr. Burdett and Mr. Morgan, of this
place, were out, and bagged five red foxes in one day. On
bec. 4th Mr. Elliott and myself were out, and at 1 a. M.
the first fox was started; at 3 r. M. the third fox was
bagged, among them an old veteran who was tooltless
and tipped the beam at 13‡ pounds. Two of them fell to
my 10-bore. In this hunt only only one dog was used.

E. S.

Massachtsetts and North Carolina—Mariboro, Mass.—The Mariboro Sportsman's Club have held one glass ball shoot since the new year came in (Jan. 15th), and had a nice pleasant afternoon for outdoor sport. We had out about a dozen shooters, and shot sweepstakes. The President of the club, Dr. Chamberlain, made the remark, when he took three first prizes in succession, that his little gun had not forgotien its cunning, but after that, Eager, Fry, Lughton, Bodrey, Brush and some of the boys had a chance to shake hands with some of the boys had a chance to shake hands with some of the honey. We shall shoot once in two weeks the rest of the winter. One thing we copied from the Worcester Club, to which many of our members belong, that is to have hot coffee on the stove in the club-house all the time when the shoot is going on; it keeps a man warm and in good humor, or at least it helps to.

D. S. Mooney, one of our most popular members, has just returned from Currituck, N. C., where he has been for the last eight weeks and has had some splendid duck shooting. One day he killed with his Schuyler gun one hundred and twenty ducks of different kinds, but a majority of them were red-heads. He also had splendid quail and snipe shooting, with a few woodcock. He took his splendid setter dog "Boss" with him, and he was the admiration of the natives there, as they have nothing but duck dogs. They make very little account of anything but duck and sea-fowl shooting. The weather was very warm most of the time, which made canvas-backs very warm most of the time, which made canvas-backs very warm most of the time, which made canvas-backs very scarce. MASSACHUSETTS AND NORTH CAROLINA-Marlboro,

New Jersey—Imperial Lodge, Tom's River, Jan. 31st. The weather still remains warm, with no ice whatever in the bay. The duck shooting remains good, with a prospect of continuing; and some good bags of red-heads and broad-bills, with occasionally a canvas-back, are made overy shooting day. Monday, Wednesday, and Friday are the days in Musquito Cove, where the duck now are, Shooting on the main bay is allowed on all days. S. K., Jr.

PENNSYLVANIA—Allentown, Jan. 30th.—The one hundred migratory quall, which were imported last spring, were released on farms in Lehigh County; and out of this lot, to my knowledge, not one covey was hatched. One or two pair were seen last fall, but where they are now no one knows. The land is full of "Bob Whites," and if the winter will not get worse we shall have plenty by next fall.

no one knows. The land is full of "Bob Whites," and if the winter will not get worse we shall have plenty by next fall.

Notes from Kentucky.—Mill Springs, Ky., Jan. 20th.—Our crop of qualis is not up to auticipations based upon the multitudes of pairs seen during early summer. The very few wing shots of this county have hunted but little, and the annual influx of visitors has yet to report. Parties from abroad lawe invariably manifested so great a degree of pot-hunterism in neither sharing game with farmers over whose lands they shot, nor having game served where they sojourned, that numerous conspicuous posters would have surprised, and divers "Git out of thir's" amazed them had they come around as usual. My first day's sport of the season, in company with an enthusiastic young visitor during the holidays, resulted in twenty-eight of the fattest quali that fever saw in the same bag, and eight hares that were singled out because of their extraordinary size. Many wild turkeys have been killed in my immediate neighborhood; a deer was chased within carshot of my house recently; the music of a neighbor's pack in full chase is enjoyed semi-weekly—oftener if the weather be unusually propitions. The last report from three of the boys a mile away was that they were in hot pursuit of a black bear which has prevailed the past four weekls or more. Remarkable weather—mercury in shade often registering 60 and 70 Far. More than one thunder storm recently. Several of our Central Kentucky hunting clubs have long been accustomed to making annual excursions to the mountains of East Tennessee in quest of deer, and two or three came to grief this fall through ignorance of an ordinance against Kentuckians trespassing on that sacred soil and the prerogatives of that favored people, and a deef ear to the warmings of their brethren just over the line who know. Their convictions were that hunters on the border would selfishly confine them to Kentucky territory and they pushed ahead cheerfully, to be promptly individend their treasury

WILD PIGRONS,—Oxford, Ohio, Feb. 2d.—Pigeons are reported feeding in the bush north of here. There was a novel match at a little town ten miles up in the country. It was reported that there was to be a glass ball match on Saturday afternoon, but through some mismanagement the balls did not come. To avoid disappointing those that came they used potatoes. The match was a satisfactory one, I believe.

satisfactory one, I believe.

INVA—Poweroy, Jan. 26th.—We have been having a very open winter, and during the last two weeks it has not been cold enough to freeze nights a great deal of the time. The sky appears warm and hazy, shillar to Indian summer. The ice is nearly all thawed out of Twin Lakes, and for the present has ruined the hopes of ice-house owners. During a thirty-mile drive across the country to-day I saw a large number of prairie chickens and quait, while around the lake were large flocks of ducks and geese, and occasionally a string of pelicans were seen floating lazily along.

ARIZONA—CANNO TROMAS JAN. 9th—Quait shooting

ARIZONA,—Camp Thomas, Jan. 9th.—Quail shooting has been very good here this season. My score is 760 quail, about 20 Wilson snipe and 40 ducks, Very few saine and ducks stop. nipe and ducks stop.

The Fournam Gun Club.—On Monday last the Fountain Gun Club held an enthusiastic meeting in their cosey new rooms at Harry Miller's in Brooklyn. Every chair was filled and "standing room only" was the rule. The occasion was the regular monthly business meeting. Since the club's members determined to possess a head-quarters second to none in this vicinity, the interest of the residents in the reighborhood became decidedly aroused.

The "Heights" near the ferry is sufficiently provided with social club houses such as the Brooklyn and Kluss

the residents in the reignormode occurred accuracy aroused.

The "Heights" near the ferry is sufficiently provided with social club houses such as the Brooklyn and Kings County, but the equally important "hill" around Prospect Park was without such convenience. The Fountain Club appear to have met this necessity, and now its members hav, without interruption, and with proper privacy, come togother in an elegantly furnished suit of apartments and pass a social evening in a friendly game of whist or euchie, or, if so disposed, neet worthy antagonists in the philosophical games of chess and draughts. Scarcely had the improvements been imagurated ere the applications for membership began to pour in. Indeed, the President was so importuned by many members that he felt it his duty to call a special meeting to receive the petitions and set the examining committee at work that their reports might be acted upon at the regular meeting of February. At this last meeting the committee reported favorably on nineteen of the applicants for active membership and nine nominations for hororary membership, and all were elected. The club now numbers about 125, and bids fair to be the largest in the State. Good-fellowship has always 'prevailed. One reason for this is the invariable opposition shown to gambling, no matter in how insidious a form it may appear. After the election it was decided to add another room to the accommodations now existing, and the necessary leuse was taken, and the former satisfactory committee—Messes. Wingert, Clamberhin, Ilines, White and Beggs—were empowered to proceed immediately with the enhellishments. Mr. Chamberlain presented the club with a beautiful statuette chandelier, the counterpart of that

recently given by the President. An executive committee consisting of James White, Charles W, Wingert, Frank C. Chamberlain, J. J. Bennet and William Cleaver, was appointed to meet like committees from the other clubs uniting in the movement to invite the State Sportsmen to hold the Convention of 1831 in Kings County, It was unanimously determined to celebrate the anniversary of the conception of the club, Washington's Birthday, with the usual "crow shoot." A committee was appointed to procure the necessary crows and provide the usual dinner at John McMahon's hotel at Sheepshead Bay. These annual reunions have become an institution, and are always anticipated with a pleasure which has never failed of accomplishment. A pleasart incident was the vote of thanks given to the soveral donors of the decorations about the rooms.

has never failed of accomplishment. A pleasant incident was the vote of thanks given to the several donors of the decorations about the rooms.

Where to Go for Trapping.—Dugdale, Chester Co., Pt., Jun, 31st.—Your "Game and Fish Directory," just started, is just the thing needed—the only trouble, most of the notes and extracts given will be in most cases "blow-your-own-lovnt" style, as a kind of advertisement for certain proprietors of hotels, and the nost primitive out-of-the-way places will not come into notice. Every-body has their hobby, and mine is, emphatically, trapping, although I enjoy beating and hunting. I wish we could have accounts of more out-of-the-way places, frequently known of by your readers, as being great retreats for otter, mink, marten, raccoon, etc. I am sorry to say professional trappiers as a rule are not much given to intelligence or reading, and hence we do not get much from them. Now there are plently of hunters frequenting these wild retreats in quest of large game who are of our most intelligent citizens, who are sufficiently observing to give accounts of what they have seen to be of great use to the trapping fraternity in looking up a locality for operations. There are undoubtedly splendid localities for in-bearing animals in parts of Nova Scotia, Maine, the fide-water region of Virginia, and eastern counties of Novth Carolina. Have you not resident subscribers, or those on your subscription lists who have been through some reliable information, with mames of parties with whom correspondence could be opened? I would give as a good place, which I am familiar with myself, West Point, White Co., Ark., as head-quarters—principal direction of operations for good trapping and deer hunting, Little Red River, to junction with White River; along White River, up or down. Another good place, from head of Ratt Creek down said creek, which is a small stream, sluggish and very crooked, flowing southerst in the subscriber. For infornation, address, with stamp, Jos. M. Lindley, Esq., West Point,

Ark.

THE AUXILIARY AHEAD.—New Berlin, Dweal Co., Fla.,
December 20th, 1879.—Messrs. Auxiliary Rifle Barrel Co.,
New Huven, Conn.—Geffs: The rifle barrel I purchased
of yon is doing as well as any one could wish for, and far
surpasses my expectations, both in execution and con-

emence.
Have used it a great deal on alligators, etc., and in ood hands it is certain death. Have killed several at ery long distances, and for turkey and deer it is just the

yery long distances, and for turkey and deer to is just one thing.

Had a "shoot" with an old-fashioned rifle that has quite a reputation about here, and the result was as usual, viz.: Auxiliary ahead; other "no where," and the longer the distance, the more your barrel led. Your new folding sight is not in the way in the least, and with the rifle barrel, makes the most effective as well as the most complete arm I ever used.

Should advise every one owning a breech-loader to have one, especially if they intend coming South. They will not have reason to regret, and may feel, as I do, thankful that I own a Shelton auxiliary burrel.

K. S. Griswold.

BOY AND GUIDE.

LOWELL, Me., Jan. 1st.

Lowell Me., Jan LOWELL, Me., Jan. 1st.

That slug had hit his leg in the gambrel joint. I was as proud now as I was a few years before, when I killed the lirst partridge. So I went on killing a deero eccasionally, and soon as I was able to buy a gun I secured one with percussion caps, and I was very successful with it, I used to put in about nine buckshot and a round ball top of the shot. I killed a great many deer with this gun. I soon learned to manage a bark canoe and used to go hunting deer where they came out to the lakes and streams to feed. I was pretty sure to get near enough to shoot one if I could see the deer before he saw me.

I would work along near the shore, and when the deer looked up I would keep perfectly still until he went to feeding or turned his head from me. Sometimes I would stick bushes and weeds, tall grass, etc., in ad about the bow of my canoe. I find this a very good way to get up to ducks and all kinds of game when it is convenient to use them. I have kept on until I have hunted them most all ways that I ever heard of. I make my own canoes, snow-shoes, and moccasins; also make for others, and am now making for lumbormen and hunters. I go as a guide and furnish guides, canoes, etc., for parties during the hunting season. At one time, some years ago, I had a party from Rhode Island; I took them to the schoodhac Lakes for the purpose of hunting deer with dogs. There were nime of us all told. Deer were plenty, the lakes were plenty, and high winds were plenty, the lakes were plenty, and high winds were plenty, too. The most of the deer we started would go to some lake where there was no one to watch, or some part of the lake where we could not get nor hear the dog. When I hunt wilt dogs I don't find it as I have heard some writer say, that any boy that could row a boat or shoot a gun could get deer by the ton. I find that if a dog starts a deer near one lake, if there is another lake three or four miles distant, he is most likely to go there. It requires skill, practice, and good judgment to be successful with dogs and canoe

SHOOTING MATCHES.

THE DEXTER PARK TOURNAMENT.

The pigeon shooting tournament at Dexter's Park, L. I., last week, was one of the most notable events of the kind that has attracted the attention and participation of the crack shots of this vicinity for some months. The summary of the shooting is a

OHIO-Nelsonville, Jan. 24th .- Match between John McGary, of Straitsville, and Jas. Roy, of this place; ground trap;

BOGARDUS' LAST CHALLENGE.—The challenge of Captain Bo-gardus has drawn out the following through W. W. Judy, of North Firth street, St. Louis, Mo.: I accept the offer of Captain A. H. Bogardus to shoot him a match at pigeons in New York Some time in June or July, 1880, on the following conditions:—To short 100 best rook or wild pigeons each, from five trays five bore, use of both barrels. If ounce shot, the dend birds to be bore, use of both barrels. If ounce shot, the dend birds to be retrieved by a dog; for \$4.000 as side, \$500 forfeit, with the option of raising it to \$2,000 a side on the day of shooting, Captain Bogar-dus to allow \$500 for expenses, and to deposit that amount, to-gether with \$500 forfeit, in the hands of the New Yark Clipper, as stakeholder, on or before May 1st, 1880, and to give forty days' notice in said paper of the time and place of shooting. I reserve the right, in accordance with his offer, of not giving the name ntil the time of shooting. Jan. 5th, 1880. AN ENGLISHMAN.

Cincinnati, Jan. 28th. - The following is the score made in the sixth and final competition for the champion badge given by the Cincinnati Shooting and Fishing Club for best glass balls shot. In these matches the Bates & Baum rubber-band traps were used, having a throwing capacity of 40 yards, and the rise being 18 yards made the shooting very difficult. A screen was used in all inatches, and the balls were thrown in every direction. Out of the 120 balls shot at, Whetstone broke 102 and Caldwell 99, Whetctone winning by 3 balls. Scores were made by other members of the club, but were not counted, as they withdrew from time to

The Rifle.

MASSACHUSETTS-Boston, Feb. 2d, Mammoth Rifle Gallery .- The last MASS-ACTUSETTS—Boston, Feb. 2a, Mammoth Rife Gallery,—The last week of the New Year Rife Match has outrainked all others in fine shooting, and brought out the crack shors from the several rifle associations in this vicinity. Mr. E. F. Richardson made four clean scores and received \$80 in gold. Mr. H. L. Lee, Mr. E. B. Souther and James N. Frye were successful in getting one clean scores and received gold in gold. Mr. H. L. Lee, Mr. E. B. Souther and James N. Frye were successful in getting one clean score and receiving \$50 in gold each. All of the above gentlemen are members of the Massachusetts Rifle Association. One year zee the extra prizes of \$50 for a clean sear was offered by the manago the extra prize of \$20 for a cican score was offered by the man agoment, and during the year it has been won sixteen times—six times in 1879 and ten times in January, 1889, and hereafter the management will offer an extra prize of \$20 to any one who makes the largest number of clean scores during the month. The following are the prize winners in the New Year Rifle Match, with their scores in detail; 150 feet: rounds, 8; possible, 40: -

| M. Dorler 602 | T. Oniel | O G |
| M. B. Engel | | |
| | | |

Next competition will take place at the same place Feb. 8th

FISHER'S GALLERY.—Brooklyn, N. Y.—The Empire Club match or Ballard rifle was ended last week, J. W. Todd being the winner. Homer Fisher was the winner, in Saturday night special, with the score of III—possible 125—German ring target. The reduced ring targets are meeting with a great deal of favor, as being a better test of marksmanship than the Creedmon. Mr. F. Ing a better test a marsanary man to extension and H. Holton, on January Hth, made off-hand a score of 229 in ten shots—a possible 330—in the target fired at the centre of bull'seye, counting 25, measuring only 3-16 of an inch. A prize of \$10 (ten dollars) is offered to any one who will excel it.

Onio-Cincinnati, Jan. 11th .- The following is the score made by the Cincinnati Shooting and Fishing Club in the sixth competition for the Baker Medal; 200 yards; off-hund; 15 shots; Massachusetts-Creedmoor:—

NEW ORLEANS-Jan. 23d,-To-night the members of the Cr cent Rifles, in full uniform, under command of Captain Pleasants, marched to the residence of Mrs. Thibault, on Euterpe street,

where Miss Ella T. Thibault presented the company with a hand-

Mr. W. C. Flower, First Sergeant of the company, accepted the wift with appropriate remarks, and in return of the compliment on behalf of the company, presented the fair donor of the guido with one of the company's badges.

Arghery.

WITH BOW AND ARROW AMONG THE WILD PIGEONS

MONG the numerous articles written for Forest and Stream A NONG the numerous articles written for Forest and Stream

on the subject of archery is a communication from Will H.

Thompson, whose views agree very well with my own opinions
and early experience. But I fog leave to correct Mr. Thompson
in the belief that he and his brother were at any time the only
archers in the United States. During my boyhood days lived in
close proximity to a tribe of Indians, of whom I took my first lessees in the use of the bow and subsequently become whole. cose proximity to a tribe of inducts, or whom 1 took my first re-sons in the use of the bow, and subsequently became much at-tached to that kind of sport. Partridges, wild pigeous, squirrois and numerous small fary fell victims to my aim. I continued the practice of shooting with the bow and arrow until long after I became familiar with the use of the ride. It is a healthy exercise, became familiar with the use of the Fig. 11 is a neutry exercise, especially for young people; it strengthens the arms and chest and toughens the muscles. The exercise has never wholly lost its charm with me, and although out of practice for many years, I think that I could pull a pretty strong bow yet,

The bows which the Indians used in early days (say fifty or sixty The bows which the Indians used in early days (say fifty or sixty years ago) wore made of white ash or jinkiokory, worked out of feaso-soned timber and washed over at different times with bot oil. They became impervious to water and still retained the natural strength and suppleness. However plenty hickory and ash trees may be, there are comparatively very few which are of the quality which is required to make a good bow. The strings were made of a single strand of rawhide evenly cut and slightly twisted and made perfectly round by rolling, being about the size of common fence wire and apparently about as hard. Blunt-headed arrows were used for killing brids and small rume, and were invariably were used for killing birds and small game, and were invariably used among the wild pigeon roosts and nesting grounds.

Among the happiest recollections of these latter days are those that carry me back to boyhood sport among the wild pigeous. Reader, have you ever visited the nesting grounds of wild pigeons? If not, I believe you have missed seeing one of the wonders const. I not. To each eye and a masset esting one of the women's in intural history. The first and most extensive nesting grounds that I visited was in the western part of the State of New York as early as 1833. The nesting began in Cuttaraugus Courty, each the Allegheny River, reaching north to the town of Collins, Eric County, covering a section of country about thirty miles in length County, covering a section of country about thirty miles in length and supposed to average six miles in width, including a part or ull of the following towns: South Valley, Cold Spring, Napoli, New Albion, Dayton and Towanda, most of which have been organized and settled long since the date above mentioned. Here was an area estimated at 180 square miles, covered with a thick growth of timber, every tree bearing from one to fifty nests, according to size of top. Here I enjoyed the satisfaction of rambling through this enormous hatchery. Although I was a youngster at that time, the remembrance brings many fond recollections. I have visited some considerable number of hatcheries since then, but small in comparison to the extent and magnitude of this. None but large and extensive forests, with an overabundance of beech small in comparison to declared and magnitude 0. this. Note but large and extensive forest, with an overabundance of beech mast, could support such a wast body of pigeos during the time cf_building, batching and feeding, which last six or seven weeks, more or less. The building begins about the 1st of April, or be-fore if the spring is favorable; of course the supply of food is the tore it the spring is invorance; or course one supply or toon is the product of the year preceding, which has remained under the snow during the winter. The nest consists of a bunch of dry sticks and twigs, which seem to be slightly thrown together, yet they are so strongly and ingeniously connected with the branches that winds or atorns cannot dislodge them.

One of the wonders is where all the sticks and fangs were gathered which were used to the construction of these products.

One of the wonders is where all the sticks and fangs were gathered, which were used in the construction of those acests. If there were only one or two thousand the material could easily be found but when the number reaches up into so many millions, we are at a loss to know where all the nesting material could be collected. It was seldom that more than one young pigeon was raised on a single nest, but occasionally two were found. During the time of building and batching, the mast on the batching grounds would be mostly consequently the old birds were compelled to forage for long distances to collect food while feeding their young; and not the least wonder is the instinctive knowledge by which each pair is enabled to return direct to they knowledge by which each pair is enabled to return direct to then when each pair is changed to the thousands of others in close proximity.

Perhaps there is nothing that will draw out a whole tribe of

Indians, old and young, like a pigoon hatchery. The fiesh of young wild pigoons is fat and juley and fine flavored, and doubt-less a young pigoon is the sweetest and daintiest tonset that ever lickled an Indian's palate. Here were gathered at different points most of the natives, old and young, from three or four tribes of Indians. Here the best archers from the Buffalo, Catternauga, and Alieghany reservations had met for a trait of skill. I am not well posted in the scores of modern times, but it was then and there that I saw greater feats in archery than I ever witnessed be-

ore or since. It seems that the Sencca nation of Indians have wholly or nearly abandoned the use of the bow, save among the small boys. ANTLER. Piney Falls, Jan. 13th.

SCORING IN ARCHERY.

SAN FBANCISCO, CAL., Jun. -th, 1880

Editor Forest and Stream:—
In your issue of Dec. 25th I notice Mr. "Massassit Bowman" comes to the front in favor of the present system of counting, wanting more particularly to have the gold stand well in figures. One of his propositions is that the additional rings are a concession from good shots to poorer ones. A natural inference is that Mr. "Bowman" is one of the few who so badly use up the gold when report they appear before the target meaning business. Another untural inference (from this distance, decidedly more probable), is that he is among the army of archers, who, by an occasional scratch-gold, make up the average lowered by more whites and scratch-gold, make up the average lowered by more whites and blacks, while his opponents keep steadily accumulating blues and reds. Granted, that the gold is the mark for nil archers; I have yet to hear of one who can each it every time, or who despises the red or blue when credited to his or her score. That the rillemen have found the Creedmoor target about right, is evident enough; and they don't worry over a "four" as much as they would fit in made a difference of two instead of one against them. Why should an archer have a greater penalty than a rilleman for corresponding shooting? The two are more nearly alike than any other

sports I can recall, just now. I claim that a score of 200 made up of blues and reds, is better than a like score made up all the way from white to gold. I claim further, that the blue-and-red man is a bet white to gold. I can further, that the blue-and-red man is a bet-archer than the other, and should be entitled to as much consid-eration in the matter of system of counting. As far as the ques-tion of having the gold for the mark goes, a target made up after tion of naving the goal for the marks goes, a target map in after that standard would have very little charm for the majority of surchers, and detract very much from the pleasure of shoring, as few wrichers would find much pleasure or satisfaction in spending most of their time classing after arrows which missed the mark. If Mr. "Massassit" will put up a dout of that sort some day, and try, say ninety arrows (American Round allowance). I fancy his re try, say indee; arrows (illustrican bound anowance), I find a list spect for the additional rings would increase in proportion to the contracted appearance of his score, and fatigue of legs wearied with much arrow hunting. I remember my first impression of the present system of counting was to wonder what genius took the time to study up such an odd system to impose on the con fiding archer, when the natural first idea would be of numerical succession, i, 2, 3, 4, 5; and the next impression was to wonder how long it would take the archery fraternity to awaken to the fact that the system should be changed and (in my humble opinion) improved. It would make it more intelligible to the opinion) improved. It would make it more intengrate to general public, be more easily counted and understood, and a mental wear and tear of scorers and shooters. I would sug to my New England fellow-archer, that, after he had tried new system, a 5 (put in a big full-faced fellow, Mr. Compositor new system, a so put in a nigruin-meet relow, and compositor, would perhaps look as big to him as a g (smallest you have, Mr. Compositor) does now. At all events, I hope the discussion now going on in your columns will eventually lead to the change, and that It will be made soon. I want all the whites I usually get to stand a better chance; and perhaps Mr. "Mussessio Bowman" stand a better characci and perhaps Mr. "Massasolt Bowman" won't object to that sort of thing himself, after be gets a little-accustomed to ft. We can't all be champions. The California archers are talking up a League for the Pacific coast, and, if a ecomplished, the Eastern archers may rest assured this change will be strongly and control as a far as I can Judge, adopted. When will the National Association do as much? PACTFIC POOR SHOT.

GALESBURG, III., Jan. 19th, 1880.

Patter Forest and Stream :-

Permit inc to express my sympathy with Mr. Brownell in his desire that the present system of archery seoring be reformed at least thoroughly discussed.

The advantage that larger arrows have over smaller, is compar The advantage that larger arrows have over smaller, is compar-atively a small matter; and the difficulty of determining upon which side of the line the extreme point of the arrow strikes, is obvious. A more practical plan would be to give an arrow strik-ing two colors half the sum of both. Thus, large arrows would have the advantage just outside the dividing line, and small ones inst inside

past inside.

The element of linek at long ranges can be made more unimportant in a better way than by changing the relative values of the colors of the target. Leave these values as they are, and add something to the score for each hit as such, say, at eighty yards, one, at one bundred yards, two. I give an example at each dis-

| Present Method. | | | | | Proposed Method. | | | | | | |
|-----------------|------|-------|--------|------|------------------|-----|--------|---------------|--|--|--|
| 80 Yards | 128 | Hits; | Score. | .100 | 28 | | Score. | .102:28 = 130 | | | |
| 50 THIRE | 123 | 1.6 | 6.6 | | 23 | +1 | 44 4 | 103:23 = 126 | | | |
| 100 Yards | 123 | | 1. | 77 | 23 | ++ | ** | 77:16 = 123 | | | |
| 100 1 11/45 | 1 18 | 4.5 | 6.6 | 80 | 15 | 1.6 | | S0:36 116 | | | |

Of course, the amount of allowance for hits should be determined by the judgment of our most experienced archers; but it seems to me that there should be some allowance at the long

\$22 how is knotty and crooked. I knew no better than My 2.2 down is kindly and crooked. I saled no better than to select such a one; but, after all, I selected better than I knew. The record shows that though "a rum un' to look at, it is a good mt'" to shoot. This record begins August 21, 1879. Since then I have recorded bl York Rounds, 4,664 arrows; 432 American Rounds. 8.930 arrows-total, 8.394 arrows

9,699 arrows—total, 5,595 arrows.
Many scores I did not record at all; neither is account made of flight-shooting, in which I have indulged considerably; and,especially it will be observed that there is no record from June 1st to August 21st, during which time I shot quite as assiduously as later. August 281, during which time I shot quite as assiduously as later, though at shorter ranges. I think I must have shot at least 15,00 arrrows with my bow. I have broken several strings upon it; and three times inadvertently pulled an arrow through it; still, the "crooked old stick," as one manufacturer called it, is there—the only bow I use. A few days since it three an owdinary forty-six target-arrow two hundred and thirty yards. I need not say, while I am pleased with my bow, I am a diamed of myself: bu h a verdant archer needed just such a tenacious boy

Such a vertical account needed just such a tenacious bow.

Permit me to say in conclusion, that the purpose of a bow, as it seems to me, it not to last, but to shoot. I have a Japanese bow that I never use, though I am sure I could never break it.

HAWTHORNS VS. PEQUOSSETTS,-Boston, Jan. 24th,-Match be tween Hawthorn Archers, of Boston Highlands, and Pequess-ette Archers, of Watertown, Two reunds of 33 arrows each, ladies, shooting at 33 yards, and gentlemen at 49 yards:

| _ , | | | |
|---|--|---|---|
| HAWTHORN AR | CHERS. | | |
| F. H. Brackett Dr. J. Dwight R. Worthington, Jr G. A' Smith Miss R. Wilson Miss F. W Miss J. Wilson Miss J. Wilson Miss L. Brackett | Round. 148 151 173 150 141 130 139 120 | 24 Round, 182 153 131 119 115 118 106 119 | Total 330 306 304 269 256 218 247 239 |
| 1 | ,152 | 1,047 | 2,199 |
| PEQUOSETE AI A. S. Brownell S. P. Abbott N. D. Abbot Miss Walker Mrs. Slishee Mrs. Shackford Ladies' Average Gents' Average | 124 135 117 90 117 88 110 105 | 152 132 112 107 119 79 102 132 | 276 267 229 90 224 207 189 207 132 |
| | 886 | 935 | 1,821 |

Several of the archers have not shot for some time, and this circumstance, together with the very trying light on the targets, affected the scores considerably. Several of the gentlemen have frequently nassed 200 score, and the ladies have shot as high as 175, at 30 yards, and 141 at 40 yards.

NEW YORK ARCHERY CLUB.-The New York Archery Club ha persevered in its search for winter quarters, and is now admirably located at the Ninth Regiment Armory, Twenty-sixth street, beboard at the Anna Augusent Amon's, Inventy-standards refer to tween Soventh and Bighth avenues. The drill-room of the ar-mory, the use of when so brighth are the courtesy of Col. Stypien, Is 30x230 feet, and 54 feet high, alterding full room for 4c-yard, 5d-yard and 6d-yard shooting. The regular meetings of the club will be held here every Saturday evening. and as the club has so cordially opened its doors to the interested and its the third mass of containty operators in this noble game. The public we look for an increased interest in this noble game. The membership is rapidly increasing. At the last monthly meeting five new names were added to the roll and three others were pro

Last Saturday evening was the first practice in the armory. The Last saturacy evening was the irst practice in the armony. The ladies shot for the monthly prize, which was Thompson's "Witchery of Archery." Mrs. Dr. De Luna won it with a score of 335. The gentlemen shot for the weekly badge, and it was eaptured by Mr. Breeze with a total of 532-90 arrows at thirty yards. The return match with the Asshma Archers, of Brooklyn, E. D., we understand, will now soon be shot; while the club has another challenge on its bands from the Oritani Club of Hackensack, N.J. The gentleman who sent the two linen-thread how-strings a few weeks ago will confer a favor by sending his address to Dr. A. B. Do Lung West Thirty-second street.

Y ORK VS. BOSTON.—New York, Jan. 30th.—Archers in New NEW YORK VS. BOSTON.—Acw Fork, Joh. 300.—Arches in two York and vicinity are respectfully invited to send official scores of the American Round to W. Holberton, care of Conroy, Bissett & Malleson, t Fullon st., or to W. C. Beecher, 237 Broadway, so that Malleson, (Fullon St., or to w. C. Beccher, 25) Flootives, of the a feam of six may be selected to shoot a match with the Boston archers next Decoration Day (May 20th), the first match to be shot at Mount Morris Park, and the return match in Boston on some litter data - cores to be sent in by May 1st. Matches for positions on the tea " will be shot during that month.

W. HOLBERTON, President Oritani Archers

The veteran Major A. G. Constable, President of the Brooklyn Archery Club, has been unanimously elected Second Vice-President of the Grand Mutual Archery Association for the ensuing

-In reference to Mr. Gray's bow, which a correspondent stated was returned to the manufacturers because ! last week was returned to the manificatures declared to a show shapen, Messis, Conroy, Bissert & Malleson explain that the bow was sent back to them simply because Mr. Gray wished to ex-change it for a heavier one—Mr. Gray's letter and the bow itself, both now to be seen at their office, showing this.

Dachting and Boating.

Keels and Cutters.—The new yacht now building by Alonzo Smith at Islip for Mr. J. G. Cassatt will be rigged as a cutter. The Cornelia, originally built for Dr. Vondy, J. C. Y. C., has been sold to Mr. Chas. Warren Lipplit, of Providence, R. I., and will be turned into a keel. Verily, signs of the times.

YACHTING IN LAY JOURNALS .- It is unfortunately true that the AXCITING IN LAY JOHNALS—Its unfortunately the data of lay journals have as a rule very poor accounts of yacht racing in their vicinity. Sometimes the nautical flights of the Bohemian tar are inscrutable and wondrous in more ways than one. The Philadelphia Sandray Mercury is an exception to the rule, and a Philadelpha Sulled Merculy is an execution of the line, and we most agreeable one at that, for in its yachting column the hand of the adept can be traced in every line, and we are glad to know that our contemporary intends continuing in its good ways.

"SAPPHO."—This schooner has been laying up for two months past in the old harbor of Marseille, but has now been taken into dock to have her copper looked after and prepare for the grea dock to have her copper topole the same properties to the grade of the Nicoraces. It is also said that her spars will be lengthened to the old racing proportions. If Sappho will only be put in the hands of an American skipper she is safe for the big prize.

MEASUREMENT.—Classification according to length only is generally condemned, and this judgment has in our eyes all the more importance, since it is not only the expression of the majority but it emanates also from the most competent yachtsmen bes minted with the maragement of races,-Le Yacht,

SCREW YACHT.—The generally accepted percentages among naval architects are: Wooden vessel equal 100, then from vessel equal 60, and composite vessel 56. In small vessels the difference is not so great, especially when special construction or heavy equal 60, and composite vessor on. In smart vessors in unterrence is not so great, especially when special construction or heavy plating is necessary to secure rigidity in iron sloops. Mischief weighs about as much as a wooden sloop, but has her weights posed to better advantage for strength and stability.

THE MORE THE MERRIER .- Our esteemed contemporary, the THE MORE THE BELLATION.—The execution contemporary, the Spirid of the Times, sees danger to American yachting in the fleet of steamers now building. But in reality there is none; we have sea-room for all, and if a limited portion of the community prefer the greater certainty and greater speed of finescrew steam yachts. the greater certainty and grouter speed of integerew steam yachts, by all means let us have them—the more the merrier. There will always be enough among the other half of the public to choose the romance, roominess, cheapness and adventure peculiar to the sailing craft. A glunce at the fleet of big steam yachts in England shows that we are a long ways out from driving out the sailing yacht, for in America the preponderance of the latter is in ing yacat, for interior tas proportion and consider a single greater than in England, yet no one dreads any direc consequences to the prosperity of the noble fleet of cutters, yawls and schoon-ers abroad from any inordinate or abnormal weakening in favo of steam. Anything that sets the American afloat and carries him out to sea away from the dyspeptic desk and business ries will be sure to make a man of him, whether he hoists his flag aboard a first-class steamer or at the masthead of a flying schooner. If the iron frames of deep draft, scaworthy steamers are going up in many yards, neither will the builder of wooden sailing vachts complain, for he is busy swinging his adze from morning till Prosperity in one branch goes hand in hand with activity other, for both are indications of the growing wealth o the nation.

LYMAN'S ROWING GEAR .- With the spring the demand for Lyman's bow-facing rowing gear is likely to spurt up afresh. For family and sportsmen's use we know of nothing better, and Mr. Lyman has many testimonials indorsing the advantages clair his invention. Prices have been reduced. Mr. Lyman also ids excellent boats of all kinds. Send for his circular. for his inventio

I'ez Boarno,—Sturgeon Bay, Wis., has got an ice yacht, and undertakters are smiling at the business outlook. This is the online of the Sturgeon Bay Advocate. "To travel a mile a minute is something to be proud of, and to tell to your grand-children when you take them upon your knees to delight their procent souls with the usual after-supper batch of lies about the innocent soils with the data milet a minute it with the risk of a black walnut was of traveling a mile a minute! Ay, there's the risk. Why, you wouldn't have any grandchildren to lie to. What's the use of traveling a mile a minute at the risk of a black walnut. ulster and a season ticket to the cometery?"

PROTECTING SHIPS' BOTTOMS .- Says Iron: "It appears that during a surveying expedition in Natal, which was being carried out for the Colonial Government, the discovery was made that a strongly glutinous juice or gum, which issued from certain plants belonging to the natural order Euphorblaceæ, when cut with the clearing knives, adhered so firmly to the blades that it was very difficult to remove. It was further found that the fron so coated did not rust, and that when immersed in the sea no barnacles nor marine life would touch it. In its pure state the gum is an ex-tremely bitter and irritating poison. To render its application practicable it requires to be combined with some other substance To effect this it is necessary to dissolve the gum in a preparation of spirits, and in that condition it will readily combine with ord-nary pigments, the combination forming a material which when spread upon a surface gives a glossy coating to it, and one, more-over, which is importious to air and moisture, while its own peover, when is importants to air and mostainer, while its own pe-culiar profestive properly remains unimpaired. A series of ex-periments were carried out on an extended scale, and were so successful that they led to works being established for the pro-duction of this composition on a large scale by the Protector Fluid Company, of No. 8 Leadenhall street, London. The reason of this success is explained by the circumstance that the b the Euphorbia, which forms the base of the fluid, being of such an intensely bitter nature, paralyzes the efforts of all insects to attach themselves to a surface or bore into any substance coated with it. With regard to its practical application to ships' both. toms, the testimony of ship-owners and others who have goes to show that the results are very satisfactory."

ADJUSTING COMPASSES.-In England some trouble sooms to Anotheric Obbasses.—In Loganiu some fromms some to have been had about Irregular deviations of the compass in new iron steamyachts. It is well known that the observed deviations obtained from "swinging ship" are apt to undergo considerable modification with material changes in climate, and if foreign voyages are contempleted by the new iron yachts now building too much care in obtaining the deviation (variation and local attracmuce care in obtaining the deviation (variation and local attraction) cannot be taken. Above all, have the tables prepared by an expert, and do not trust to the crude operations of a hero of the "belaying-pin" variety, who views with supercificusness anything that he has not been taught in the narrow range of his own

experience.

Collaysible Boars.—We are certainly far ahead in the matter
of collapsible yachts' dingeys. The "Berthon" bont of England is
twice as heavy as the "Coughtry," more complicated, folds in less
space, more cossily, and no better in model. We have recently space, none costly, and no petter in model. We have recently inspected a "Coughtry," at Moore's, in Broadway, and for the small sum of \$35 the owner of the small sloop can get a handsome, buoyant and exceedingly well finished 9ft, tender. With such boats in the market, there is simply no excuse for anyone going odns in the flatter, there is sainly all extended on top of the "house," in off on a cruise without a boat stowed on top of the "house," in the weather gangway, or below. A "Berthon" of similar size weighs 110 bs, and expose canvas only to beaching. In time an export trade in the "Coughtry" boats should be looked for.

THE CZAR'S YACHT.—Readers may remember the sudden development circular vessels received through the instrumentality of Adm ral Popoff, of the Russian navy, under whose directions several "Popoffkas" were built at the Kronsladt arsenals some A further experiment in this direction is to be made rearsago. A further experiment in this direction is to be made with the new yacht now building for the Czar. The contract has been awarded to John Elder & Co., of Glasgow. The model will be elliptic, with flat bottom, of the following dimensions: Length. 230ft.; beam, 153ft.; draft forward, 6ft.; draft aft, 16ft.; mean draft Three engines of 10,500 horse-power collectively an expected speed of fifteen knots. out on. Three engines of 10,000 horse-power concentrely, and an expected speed of fifteen knots. The cost, exclusive of fur-niture and decorations, will be \$1,000,000. The experiment will be watched with much interest, but we have not much faith in her seagoing qualities.

her scagoing qualities.

"CITONIA."—As this famous English schooner will be one of those most likely to be matched against Iller during the proposed visit of the latter to Europe, it will be interesting to note that sho has had four tons of lead put in her keel, and lead substituted for the iron inside. She is bound for the Nice races.

" FORMOSA."-The Prince of Wales has bought this beautiful 100-ton cutter, and English papers expect him to do xtensive yachting this year.

STEAM YACRIS IN ENGLAND.—They build them over there about nafnat as they can be launched. In the language of the imaginative reporter, "there is now a perfect saturnalla of steam yacht building" in England. Here is a sample: Messrs. Cunliffu Dunlop, of Port Glasgow, are building a new yacht for Mr. N. B. Stowntz. Length over all, 1927.; between perpendiculars, 1701.; beam, 271. 3in.; draught of water aft, 13ft. 6in; ionange, over measurement, 600. Compound, surface condensing engines; cylinders, 33 and 46in. with 37in. stroke; indicated horse-power, 500. The new vessel will be built of iron/to class 100. Aumer special sow. The first vesses with resum of though class to thinker special survey of Lloyd's. Feathering screw of the Bevip patent, 1011. Gin. diameter, of gun-metal. Rigged as a three-masted, poleheade schooner; minimust, 110ft. deck to truck; head-room, 5ft.; two saioons below are 55kHft; deck saloon, 10x9ft.; nine state rooms, two of 15kHs.

MINOT SMITH'S SHARPIES.-We learn that the sharple built by Minot Smith at Port Jefferson, and now in the Southern fruit and vegetable trade, has given much satisfaction. His sharple is, however, rather a departure from the orthodox, and in principle acthes the sloops. Forward she lare floors, which starts from the of the floors rises, thus secur the stepping es, thus securing a long, easy entrance, as well as a long run with moderate beam. Such a boat with a load aboard can be easy in rough water, but she is hardly to be considered a sharple any longer, but rather a sloop model with a sharp knuckle to the bilge aft, with the advantage of light draft and cheap construction.

QUESTION OF TYPE.

Editor Forest and Stream :-

I bavo read with much interest the several articles in your val-

Theorems with mind interest the several intruces in your val-uable paper on the type question, especially those by Mr. Kirby and the one in your last issue signed "Corinthian." Although far more ready with the tiller and the ribbons than the pen I take up the latter, un pet malpt may, to reture several assortions in those communications that are hardly consistent with the facts. I regret that In so doing I shall have to refer so much to my own person and doings.

much to my own person and doings.

"Corinthian," to prove the supercivity of American models, claims great speed for all of Fish's, Kirby's, and many of Ellsworth's and Steers' models, etc. According to the records Mr. Kirby has two only that have distinguished themselves in a signal manner, Manueshp and Arrow. His sail-hoats are many of them fast. Mr. Elisworth's Comet and Elephant, in the weather they were designed for, are wonders. Mr. Fish has produced some very fast racing craft, namely, White Cap, Vizer, Eca, Vision and some others that, in my humble opinion, cannot be so classed, for instance, Lots, that upset on a summer's day in a whole sail breeze; Enchantress, that Eyeria (half her tonnage) defeated in England in a thrash to windward, and—well I had better stop or I shall have some "touchy" owners about my curs.

Mr. Steers' America, allow me to inform "Corinthian," is not.
a "rule of thumb" vessel, She is a beautifully designed craft, well I had better stop or

Mr. Marrett, in his book, speaks in great admiration of this, and distinctly states that her speed cannot be attributed solely to her sharp entrance, but to a carefully designed model, beautifully balanced with centres of gravity, lateral resistance, etc., most Judiciously placed.

As to my challenge to Mr. Clapham, "Corinthian" should be As to my cannenge to sir. Capham, "continuan" some in sure of his facts before he pours his broadsides into my unfortunate self. I offered to sail Volunte in a strong breeze of my choesing against any 40-foot sharpte, and, her owners willing, will do so still. But I did not offer to sail an able 40-foot boat, with geer like Volunte, single-handed, at sea in a breeze. I weigh 110 pounds, and am not strong at that. I have crossed the "pond" in pounds, and no not strong at that. I have crossed the "bond" in a 200-tonner in winter, and rounded Hatteras in a 57-tonner in February, but I never supposed any one with any experience at all would answer my challenge with such a wild proposition as that offered by Mr. Clapham. I will say in this connection that I was not aware at the time that this gentleman was engaged profes ionally in building the class of vessels headyocates, or I should not have offered to sail bits. I have not excited that this gentleman was undestroughted that his business, and sincerely hope no harm has come of it.

Mr. Kleick, acticles contain much, but is interesting and in

pusiness, and sincercty nope no harm has come of it.

Mr. Klriy's articles contain much that is interesting and instructive, but, unfortunately, in trying to prove his theories he
does not stick to facts, and thus proves too much. I did not intend taking up his assertions as to Vinder, but "Corimthian's"
article necessitating a reply. I thought I might perform the wellknown trick of the stone and two birds.

Mr. Kleby in order to wave that descent the state of th

known trick of the stone and two birds.

Mr. Kirby, in order to prove that Arrow type is as good instrong winds and lumpy water as the deeper class, cites the June regatta of the X. Y. Y. C., in which Arrow beat Vindex the minutes, asserting that it was done in a strong breeze, and that the boats were of one size. In the first place, Arrow is 61ft, 5in. L. W. L.; beam, 20ft, 5in; draft without bend, 6ft, 4in;, and she carries 22 tons ballast. Vindex is 50ft, 4in. L. W. L.; beam, 17ft 4in; draft without keel, 6ft, 10in, and carries 17 tons of ballast; Aro these two vessels of the same size? Secondly, the weather was very light finished the Book. Here Arrow beat Vindex endy, as all good vessels of her class slould beat Vindex class; but outside, in the strong breeze, where, according to his account, Vindex action to bally, the club record shows she gained eight minutes on the larger vessel. The race ended in a handsome victory for the Arrow, I admit, but the smooth water and moderate tory for the Arrow, I admit, but the smooth water and moderate tory for the Arrow, I admit, but the smooth water and moderate wind inside did the business.

For all the Arrow and moderate wind inside did the business. tory for the Array, rading our meaning that meaning water and moverate wind inside did the business. For all this, Vindex was second, beating every other one-master, with or without time allowance, as she went on the record as second for the Bennett Cup which Arrow won. In this—the last season Vindex was in commission—

Arrow woh. In two other races, and won them both.

Foliande man yor, as "Corinthiam" says, be up to her best form, or to any form, for that matter, but sho has raced twice, and won both lines, "hands down," defeating in the first race the nearest bout—a larger one—fifteen minutes over, and in the second the

nearest one—loft, longer—about seven minutes.

Permit me on closing to state that I am not an "English cutter" man, as some of your correspondents appear to think, for I believe in medium beam and good depth (no extremes), and also cmphatically to assert that, although a devoted yachtsman, I am not "Devoted Yachtsman," as I am informed many believe me

Hoping your readers will pardon my baving kept that obje tionable person, "self," so long before them, I subscribe myself, ROBERT CENTER.

THE RACING CLUB OF AMERICA.

Billor Forest and Stream:—
In your issue of 23d inst, is published an able editorial on "Yneth Ranian Not Declining," in the comparative table accompanying which this squadron is rightly credited with lawing satied the most races in 15th. For 1870, however, the precedence is given to the Boverley Yacht Club, with 10 races and 177 starters. 'The Royal Nova Scotia Yacht Squadron is entitled, I claim, to the place of longer in 1870, as in 1878, for there were sailed II (eleven) place of Robot in 1856, as in 1856 for the over states in 1859 with 58 starters. This increase, by 1850 with 58 starters. This increase, by 1850 way, in races and starters proves the correctness of your contention.

F. C. SCHICHRAST, Honorary Secretary, R. N. S. Y. S.

Halifax, Jan. 27th.

MEASUREMENT.

Editor Forest and Stream:

Editor Forest and Stream:—
While reading a review of last year's racing by "Rouge Croix,"
I was struck with his remarks on "measurement." This subject
fsome that has given a great deal of trouble in the past, and probably always will constitute a somwhat complex question. There
has long been a desire for a uniform measurement of some kind
so that a yacht might sail in a number of races under the auspices
so that a yacht might sail in a number of races under the auspices so time a yacin inguesam an above of the same allowances. As it is now, every club unfortunately has its own method, and boats that give time in one club possibly take time in another. The first question a man asks when a race is talked of is, "What

The first question a man asks when a race is tanked of is, "what is the measurement?" and this question has made up end of frouble, and caused misunderstanding. In the first place, to settle upon some rule it must be considered what are the qualities wanted in a good beat. Speed stands first with most. Next comes good behavior in a sen, power to carry sail, and steer and work well. Speed is generally a rrived at by good bean and large work well. Speed is generally arrived at by good beam and large salts, or it may be obtained, under certain conditions, by small beam, coupled with a low centre of gravity. Attention has lately been turned to this latter plan to a greater extent than before. In Boston nearly all the new boats have some weight on the keel, and even the most pronounced advocates of the shallow and broad beam type are not adverse to lead for ballast, in the attainent of similar ends. The weights can be more concentrated and stowed lower down, making a gain in power to carry sail. Good behavior in a sea is commonly attained by high freeboard and plenty of bullast. This applies more particularly to small vessels, as large vessels are found to do well with comparatively moderate ballast, owing to their size enabling them to go through and "overpower" waves that would interfere seriously with a small vessel's way. After these qualities are obtained, head room and room below may next be considered. These three dimensions—length, beam and depth, or head room—should be left to the delegate.

and room below may next be considered. These three dimensions—length, learn and depth, or head room—should be left to the designer to use or not, as he may elect, and no pressure in favor of or against any one dihension should be permitted in a fair rule of measurement. Having gone roughly over these requirements, let us enumerate the various measurements in younge, and see what effect they have on the type or boat, and how free they have

Length comes first, and is most used in clubs where small boats

Length comes inst, and is most used in the work of what hand boars are in the majority.

The good points in this measurement are that beam and depth are loft to be used or not, according to the judgment of the designer; while at the same time it is known at the outset what the allowance will be. This measurement produces wide and heavily sparred boats, that are unfit for any extended cruising. When

caught in a sea-way the heavy and long most has great influence on the rolling and pitching, and though the sails may be reefed the mast still exerts its momentum and makes a wide heat "yaw" and wallow about at a dreadful rate and to a dangerous extent. If the man who is caught in this way increases the length of his boat he will shut himself out from prizes that he might have wen before on account of the time allowance for the addition to his length. He therefore has a strong indocement to keep his heat as she is, though he knows she would be all the better for more ength and less beam.

"Cubic contents" is the next system we will consider. At first this seems a good measurement; at all events one which is theo-retically correct at least. The designer can use what dimensions he chooses and adopt any form, without hinderance and without finding hinself handleapped in any direction. He can lengthen his boat, and only pay for what he puts on in cubic feet. But when he wants to raise the freeboard in order to obtain more head room, and keep the water clear of the deek in rough weather, he finds that even an inch will make a great increase in the bulk. I know that very bulky boats have won prizes, and boats have been raised with great gain in comfort; but the added height raises the centre of gravity, makes the boat draw more water, and does not necessarily add to the speed, except on rare occasions; yet the good results of high freeboard for cruising will not be questioned. Still an allowance must be paid for this added bulk, the same as if it had been put on the bow or stem-where it would be more of an advantage to higher speed. For a case in point we will consider the Vizan and Regina. The e beats are so evenly matched that a few seconds has proved

to be all the difference in a long race. Suppose the owner of Reto be all the difference in a long race. Suppose the owner of Regine should raise his beat and do away with part of the house, or all of it, the sloop would be better for it. She would have more head room forward, and more room in every way below, and the water would be kept off her decks. But it would not add anything to her speed in ordinary weather; she would draw more water; would not carry her sail quite as well as a present, since the centre of effort would be higher, and also the centre of gravity. The host would be better off for "all-round" qualifies, but her market value would be less on account of hor inability to sail with such as Vicen. The schooper largeid measures 13.22 cubic with such as Viren. The schooner Intropid measures 13,422 cubic Feet and the Tidal Wave 9,152, yet the Tidal Wave is 7ft. 6in. longer than the Intropid and 7in. wider. Still the Intropid has to pay a penalty on cubic measurement in a race for the very qualities we all are auxious to see an able sea boat and wholesome yacht

ose that a design has been made, and carefully worked ou with all centers properly balanced. The cubic contents figured up, and it is found to be rather more than some of craft that is to be sailed against, though the rival may, for all that, belonger on the water line. What can be be done under craft that is to be sained against, inough the liver may, for in that, belonger on the water line. What can be be done under these circumstances? The new boat is none too deep, we will assume, but free-board counts more than any other part in adding to the cubic contents, and nothing is left us but to cut it down-to reduce her cubic contents to that of the rival pack. The designer knows that the time is worth more to him than the free-board to some and though convinced that they free-board to some and though convinced that they free-board is to meet a though convinced that they free-board is to meet a some and though convinced that they free-board is to meet a some and though convinced that they free-board is to me. signer knows that the time is worth more to that that the free-board in a race, and though convinced that low free-board is incompatible with good "all round" qualities, he is compelled, nevertheless, to cut it down, and then add to the house to make up the head room, and of course regrets it every time the wind blows or the sea rises.

The next system of measurement we will consider is "length and beam." This was used for a long time by the N. Y. Y. C., and is now the rule of the Seawanhaka Y. C. This measurement can be used for all sizes of boats, and anybody can measure vacht, and compute the area without trouble, t, and compute the area without trouble. By this rule the er knows the allowance of time before he begins to work

designer knows the allowance of time before be begins to work up his plans. The boat may have as nuch free-board and depth as is needed, and she may be full or lean as may be wished.

The working of such a rule in practice on various types of hoatsnext demands attention. In 1873 the Schemer, a representative of the wide and shallow type of 17-100 ft. water line, and 15-10 ft. beam, sailed a race with the Volunte, though the latter was in the same class. Volunte is a moderately narrow and heavy displacement boat (339-510 ft. long on water line, and 12-65-100 ft. beam). The weather from the Southwest Spit, out and back, was been able to Volunte in Volunte (1808). beam. The weather from the bottowest spit, our and local was just what the Volunte likes, but Schemer beat her considerably more than the time allowd. Volunte carries about ten tons of lead, and Schemer about three and a half to four tons, part iron and part lead.

The Vindex in the same kind of a race barely managed to beat The Finder in the same kind or a free warron sanaged to bear Contingand Addie V. This shows, in my opinion, that the measurement will answer for all types of boats, and is the only rule where the narrow and deep as well as the short and wide boats can sail together with a fair "show" for either. In light weather the beamy boat can allow the deep, narrow one, and heat ber the beamy boat can arow and eeep, harlow one, and heat the time, and in had weather the narrow, deep one can pay off the score to her wide competitor. When this measurement was used in the N.Y.Y.C., the Sadie in a strong winds very often beat the Graek, though Graek was a longer boat. The number of prizes won by Sadie go to prove her claim to being a good, safe boat, and at the same una fisat one. The Orion may also be mentioned as a boar same time in fisat one. The Orion may also be mentioned as a boar of moderate beam with some depth. Her record speaks for itself. It may be said that this measurement is rather to a fayorable to the "cutter" type. It is to be regretted that no decisive trial has been made between the cutters that have been built and the beauty boats, so that more comparisons could be instituted. But as far as can be judged at present, in the weather we have in the nearly coars, so that more comparisons come be institute. And as far us can be judged at present, in the weather we have in the summer, I do not think it is likely that the very narrow type will come into general favor for racing.

The great advantage in a slightly narrower style of boat with

The great advantage in a slightly narrower slyle of boat with good head room is, that they will be much safer and have more room below for the same outlay of money. In the near future we must have a "Racing Association," and length multiplied by beam seems to be the only method under which all types can meet at the line with satisfaction. And if we do cruise to Boston and Eastern waters, for instance, and get caught off Cape Cod with the wind northeast, in a short, wide, heavily-sparred racer, a single experiment of that kind will do more to encourage deeper and heavier boats than any amount of writing on the subject. On this score, Lean steak from experience. this score I can speak from experience. A. CARY SMITH.

New York, Jan. 20th.

SOMETHING ABOUT CRICKET GROUNDS.-In our next issue will publish a thoroughly practical article on the laying out of will publish a tuoroughly practical article on the laying out of ericket prounds and how to keep them in order. The article is written by Mr. George Glies, professional of the St. George's Cricket Club, of this city. This will be the first paper of the kind ever published in America, as all previous articles which have appeared on this subject have been copied from English publications, and, of course, only applicable to the English soil and

CRICKET ON THE ICE.-The cold snap which we are now having should inspire the cricketers in this vicinity to have a jolly good game on the ice.

MANIFATTAN CRICKET CLUB

The annual meeting of this old established and excellent crister club, of New York, took place on Jan. 27th, at the restaurant of the veteran cricketer, Mr. James Smith, No. 52 Broad street. number of now members were elected, and a uniform const-ing of groy trousers and slitts, hats of Panana shape, with we and black stripes, was adopted. The club will continue to play on the Prospect Park parade grounds, a letter offering the use of same having been received from Chief Engineer/oin Y. Gilyer. same having been received from Chief Engineer John Y. Chiyer. The election of officers resulted as follows:—President, James White; Vice-Presidents, William McKenzie, Jr., and James V. Kirby; Secretary, L. Love; Treasurer, R. J. Shurri; Admaging Committee, Messrs, Jenkins, Jackson and Hurburt.

Through the kindness of the club's Secretary, Mr. L. Love, we are enabled to annex the following summary of last scason's presidence and appearance.

matches and averages :-

SUMMARY OF MATCHES.

First Eleven.

May 30, Paterson. N. J.; vs. Paterson United Eleven; won on rst innings by 50 runs.

June 16, Paterson, N. J.; vs. Paterson Club; won by an innings June 26, Hoboken; vs. St. George's; lost on first innings by 60

runs.
July 4, Prospect Park; vs. Paterson Club; won on first inings by 35 runs.
Luly 12, Prospect Park; vs. Staten Teland; won on first inigs by 35 runs. July 17, Prospoct Park; vs. Staten Island; won on first in-igs by 53 runs. July 24, Albany; vs. Albany Club; won on first innings by 18

CRICKET IN AUSTRAILA.—The twenty-third contest between the rival colonies of Victoria and New South Wales had just been concluded when the last mall loft for England. These annual, or wither six-monthly matches, are looked forward to with liminense interest by the two cricket-loving colonies. A match is played at the commencement of cash easien in clitter Melbourne or Sydney, and the return is played hat there one has easien in clitter Melbourne or Sydney, and the Victorians took up from Melbourne a very strong team. The details will be perused with some interest by American cricketers from the fact that nearly the whole of the members of the Australian team which visited America in 1878 were engaged on clither one side or the other. It will be remembered that that team was a combined one from the whole of Australia, but in the match under notice they were playing for their respective colonies, viz., Horan, Boyle, Blackham and Allan for Victoria; and Spolforth, Gregory, the two Bannermans, Murtheir respective colonics, viz., Horan, Boylo, Biackham and Alian for Victoria; and Spolforth, Gregory, the two Bannermans, Murdock and Garrett for New South Wales. As an instance of the Immense Interest taken in cricket by all classes of the community in Australia, we may instance the fact that thousands of people resemble outside the Australiasian office during the afternoon on which the match is being played in Sydney (300 miles off), the rean being that the proprietors of that paper make special arrange ments to get the fall of each wicket and score telegraphed to their

office direct from the ground, and these particulars are posted up office direct from the ground, and these particulars are posted up outside the office as soon as received. As stated before, this was the twenty-third confest, the score standing ten victories for New South Wales and twelve for Victoria, the Sydney men baving won the last six matches consecutively, but they still are two in arrear. D. Gregory captained the New South Wales men and Boylo the Victorians. The following is the score:—

NEW SOUTH WALES.

Hamilton at as early a date as possible to form the association."

ROYAL CITY CRICKET CLUB.—At the annual meeting of historganization, held at Now Westminster, British Columbia, Jan. 34,
the following Roard of Directors was chosen for the ensuing
year:—W. Moresby, President; C. N. Treer, Vice-President; W.
H. Keary, Secretary-Treasurer; Committee of Management, W.
N. Bole, J. W. Harvey, J. S. Clute. About theiry members were
present. The club financially is in a flourishing condition. There
are no honorary members, all being contributing and neitve.
There are seventy-two members belonging to the club. The club
intends to challenge the San Francisco Club some time in May.

DESTROY THE VERMIN,-The following extracts from an address recently delivered by Mr. Everett Smith be-fore the Sagadahoc Association for the Protection of Fish and Game, at Brunswick, Me., contain some very sensible suggestions relating to game protection. Smith's extended experience as a sportsman and worker in the cause of protection give him especial authority on such topics :-

such topics:—

In Great Britain the creatures that prey upon the game are termed "vermin," and the extermination of vermin forms one of the most important duties of the game-keeper. Upon a certain tree near the kennels, the game-keeper hangs all the vermin killed, that his master may behold practical evidences of duties well performed. I have derived much pleasure from the examination of such collections, not only by the variety of specimens, but by the proof of many more valuable lives saved by the sacrifice of these creatures. In the north of Europe and Great Britain the ravens and hooded crows are among the most deadly enemies to field game. These birds not only kill many young grouse, but also destroy their eggs. The game-keeper therefore makes especial efforts to destroy the ravens and crows, as well as the hawks and owls, by the destruction of their nests and young, by gun, traps, etc. Weasels are diligently trapped; but the foxes, although the most deadly of vermin, are not killed as such, but preserved to afford sport with awks and owls, by the destruction of their nests and young, by gun, traps, etc. Weasels are diligently trapped; but the foxes, although the most deadly of vermin, are not killed as such, but preserved to afford sport with the hounds. In New England, however, where the nature of the country forbids fox hunting as practiced in old England and in our Southern States, the fox should be treated as the inveterate poacher and outlaw that he is, and especial means taken to exterminate him. Those familiar with his habits know that the favorite resorts of the fox here are among the adders and birches, where he finds woodcock and young grouse in summer, and hares in winter. I do not know that foxes eat the eggs of birds, as do the skunks and some other small animals, but if, after an unsuccessful hunt for field mice in an old pasture, the fox seeks the adjoining coverts frequented by grouse and woodcock, he is only too sure of capturing a substantial and dainty morsel. If The gentle and unsuspicious nature of the woodcock renders it an ensy pray to the fox, and it is especially subjected to his attacks, from the fact of residing in just the places most frequented by the fox at all seasons; and it breeds so early in the spring that it is one of the first birds to afford repnard a change of diet and grafification to an appetite that has become revenues from the short rations of a long winter. Of the "vermin" in this State, the foxes and weasels are formost, and I would urge all persons interested in the protection and increase of ruffed grouse and woodcock to take netween measures to exterminate them. I would suggest for the furtherance of this object, that sportsnen's associations offer a reward for every one killed, naming a sum such as would when added to the value of the skin, be an inducement for the trappers to take them. The protection and increase of ruffed grouse and woodcock to take netween measures to exterminate them. I would suggest for the furtherance of this object, that sportsnen's associations offer a rewar

Woman's Column.

A MICHIGAN SPORTSWOMAN.

T behooves us women to improve every opportunity that is presented for us to come to the front and show that we are competent to write, speak or vote, just as the case demands. We as a class are not thought to be quite so inferior to the opposite sex as we were in days gone by, yet there is still existing a feeling of superiority over us. To prove this a fact, take a romark I heard a gentleman make concerning the first article that appeared in the Woman's Column in FOREST AND STREAM. It was this: "No one need try to make me believe that a woman wrote that, for its too well written." Now thelieve a woman wrote it, and that said gentleman will see cre twenty years have elapsed that a woman can not only write a spicy article for a sportsman's journal, but is capable of doing any work that requires brain power equally as well as a nam. as a man,
I do not know whether the editor of Forest and Stream

doing any work that requires brain power equally as well as a man.

Ido no know whether the editor of Forest AND STREAM be a woman's-right's man, so I will not write a sufrage article, but I do think he would not have been so kind as to give us a column in his paper if he had expected it to be filled with lines utterly devoid of sense. I thank him for paving the way, so that editors of other papers may follow after. He has given us ladies an opportunity of spending a few pleasunt moments occasionally in writing, and, in the words of Sol Smith Russel, I say; "Gtirs, improve your opportunities."

My object in writing this article is to have one more added to the list of women who do not think it vulgar to use firearms. I never awork to the fact that I could use them until one year ago last spring. My husband and I were in Petosky, Mich, at that time. He went to kill pigeons (for they were there in great numbers), I to see the country. He had from the first of our acquimitance been anxious for me to learn to use firearms, and so on this particular trip he took a gun with him for me to use. Well, the second morning after our arrival I decided to go with him to shoot at pigeous, never thinking I could hit one; but, strange to relate, I came in at noon with two dead birds, shot on the wing. This was the first of many happy hunting days to come.

Since then I have been more successful; can kill more than two birds in a forenoon, now. As I look back to those first two pigeons, I know it was nothing but an necident my killing them, for I was too exciled to take aim. It was at one time a mystery to me to know how my husband could arise at 2 clock in the norming, cat a cold breakfast off the mantlepiece, and hurry out into the poisonous early morning air, to some hunting ground than must be reached before surrise, and call it fun, I marvel no longer. The mystery is solved, for I can do the same thing myself, now. I am on hand to go every time he is.

poisonous early morning air, to some hunting ground that must be reached before sunrise, and call it fun. I marvel no longer. The mystery is solved, for I can do the same thing myself, now. I am on hand to go every time he is.

It's not so much the killing of birds I enjoy, as it is the pleasure I give my husband by going with him and taking an interest in his sports. He will pund a boat for me a whole day, just for the sake of seeing me shoot ducks; and in the field he never—well, 'handly ever'—shoots at the same bird I am amining at. He has never served me but one mean trick sinee we have lumited together, and that was last summer. I decided one afternoon that I would like to try my hand at shooting meadow larks; so we drove from our home about five miles, and came to a field where there were quite a number of them; but they were a long ways over in the field away from the road, so my husband, pointing to a stump near by, said to me, "You take your gun and sit behind this stump, so the birds can't see you, and I will go across the field and searce them up so they will gly your way." Well, I, as a duttiff wife, minded, and stationed myself, gan in hand, behind the stump, and he went across the field to send the birds to me. I sat there for some time; at last I heard bang! bang! from across the field to send the birds to me. I sat there for some time; at last I heard bang! bang! from across the field, I did not raise my head, but thought, "he has frightened some birds, and they will be coming right this way." But no; they did not come. Another bang! and yet another. Then I ventured to raise my head above the stump to see what my husband was doing, but he waved his head for me to keep quiet; I sank down again; but I was in such a cramped position that I could endure it no longer. I rose to my feet just in time to see a lark fall. Then it dawned upon me that I had been a subject of foul play. Mr. M. had been having fun at my expense, but I paid him back by killing more birds before the afternoon was over than he

Volume 14-No. 2. No. 111 Fulton Street, New York

THE SANDPIPER

THE little sandpiper that has a great stride
Like a king of the fairies, and toys with the tide,
Is a jolly good fellow of infinite pride.

He signals your presence, assuming much fear, And pipes of the danger that's coming too near Or whistles alarm that others may hear.

He eyes you obliquely, a comical way, And flutters a distance as much as to say, Thus far and no farther, and there you may stay.

But if you should trespass he'll nod in disdain, Then tell his displeasure with might and with main, And skim o'er the water to safety again.

When danger has passed him he settles his plumes, The mion of importance he quickly assumes, Subaqueous searching he gravely resumes.

Ab. little sandpiper of fairy-like stride With beautiful nature so closely allied, I've noted thee often with love and with pride.

· A river is flowing through life to the sea. A river is flowing through the so that Ariver that fancy oft pictures to me,
Where the soul is a rambler and thought is like thee.
JEROME BURNETT.

Spring Cime by the Blue Bidge Trout Streams.

IN a former paper I casually alluded to an intention I then had of taking down from the I then had of taking down from the nail on which for years it had hung, my long neglected fly-rod, and setting out in search of trouting localities more congenial to the lovers of fly-fishing. At the end of the long, cold, dry weather that persecuted us through May, after waiting and watching the heavens for days and days, the limit of my opportunities for absence was reached, and as the sun rose over the mountains on a harsh and dewless morning, I found myself with C., jogging away from home with distended saddle-bags and fifty miles of road between us and our destination. The rugged chain of the Blue Ridge Mountains towered upon our left, and our horses' heads pointed to the north. With further particulars I will not bore my readers, since strangers coming to this part of the world to fish would be foolish to choose the eastern side of the range, with the wealth of trout streams that sparkle down the mountain sides of the western counties open to them. The case though is different with residents whose lot happens to be cast upon the sunny side, for there is a vast difference to men with occupations, between a trip that entails two days upon the road and one that demands four. Neither will I tax the patience of my reader with a detailed account of a wearisome ride of fifty miles. The trout streams, or I should rather say the brooks that held trout higher up, trickled feebly over our horses' feet at the innumerable fords through which we crossed. The usual motley array of anglers for white chub and suckers that every streamwashed Virginia hamlet exhibits were there, seated or fence rails—a melancholy band. At one village, or a spot that had been a village about the time of the Revolutionmat had been at whage about the time to the accountermary War, beneath whose crumbling walls dances a clear purling stream, the store keeper had erected over the water a rude pier from the summit of which his lordly legs are to be seen dangling from court day to court day, and where doubtless, with one longing eye upon his store door and the other upon his float, he chews in silence and sadly ruminates upon the days that are no more. The populace are also there, in rows along the bank, or perched upon the rocks in mid-stream—black and white—sad and dejected.

"Caught anything?"

And the refrain is echoed dismally from mouth to mouth along the shore. The thought occurs to one that if such a show of anglers can be turned out in such an unpropitious state of water and weather, what a happy time the chub and suckers, the horny-heads and catrish must have of it on showery days.

Ask me not to recall the wicked—the cruel fabrications as to mileage that were poured into ears ears along that red and winding track. As an old horseback trayeler 1 am prepared to find men and women who will without malicious intentions double or halve a distance that they War, beneath whose crumbling walls dances a clear

may traverse twice a week. I am prepared to come across individuals who look you straight in the face and calmly deny the existence of considerable towns six miles from where they are standing. I am not at all surprised when a blacksmith of good character, or a very high-toned store keeper tells me my destination is five miles off and I find it fitteen—but the dwellers upon this Virginia highway fairly and squarely outlied any roadside population upon whose tender mercies I have yet been thrown. Their diversity of opinion not only on several occasions deprived us momentarily of our breath, which was a small matter, but finally robbed us of half our much required night's rest. The small hours must have been tolling ere the tardy moon at length rose just in time to throw her rays upon the chimneys and gables of the hospitable mansion that was to be our shelter, and it is needless to add that that night the terms bed and sleep were synonymous. I don't know that there is anything, to my idea, more heart-breaking than the act of traversing in the darkness of the night an unknown road in a strange and thickly wooded country. People who are accustomed only to the superb highways of he Northern States, and whose idea of road traveling is to sit behind tretting horses and watch the milestones dash by every few minutes, would find it hard to realize the tedium of accomplishing long journeys through countries where a more primitive civilization exists. In winter time let us forbear description; we are supposed to be writing about trout fishing, and it is daylight, your write and family may see you start without particular cause for alarm. But supposing your route to be through the Piedmont section of the State, and any of the other conditions are present, if you have not already insured your life I should recommend you to do so for a considerable sum. But, jesting apart, when a strange road enters a river, on a moonless night, that you take it for granted only is shallow and and apparently never emerges again, the most eq

Tired of up-gazing still, the wearled eye Reposes gladly on as smooth a vale

Reposes gladly on as smooth a vale.

As ever spring yelad in grassy dye;
Wherea bold river breaks the long expanse,
And woods along the banks are waving high,
Whose shadows in the glassy waters dance,
Or with the moonbeams eleep in midnight's solemn trance.

Or with the moonbeams sleep in midnight's solemn trunce. Alas, in our valley there was no sign of rain. The buzzards soared till they became as specks in the sky. The swallows wheeled far from earth. The wind blew gently and unmeaningly from the South and anglers' hopes were at zero. Soon after breakfrist, with feelings anything but enthusiastic, we started with our host, and laden with supplies for two days to our fishing grounds. After a seven mile ride along the banks of a most charming river we arrived at its forks in the angle of which, at the base of the mountains, exactly where the realms of trout and creek fish met, we drew rein in front of a picturesque log house with surroundings very on when, it the ease of the molintains, exactly where the realins of front and creek fish met, we drew rein in front of a picturesque log house with surroundings very different to those usually found around the rude homesteads of the mountaineers. Here dwell Zach whose roof tree has ever been a rendezvous to the few anglers that come from a distance, and who, always a keen trout fisherman, has of late years been enrolled among that best order of piscators—a fly-fisher.

What might be called the "rise of fly-fishing" on the two streams that unite their waters at this point is not without interest, and we devoutly hope it is only what has already taken place and what will in some future day take place on many another mountain river.

Some half dozen, or less, years ago an artificial fly or a jointed rod was a thing unknown, and all the angling that was previous to that time done was confined, or almost entirely so, to the mountainieers, who own or rent

land from the population for six or seven miles up each

land from the population for six or soven miles up each fork.

About 1874 two gentlemen from the nearest city created some astonishment and raised to a considerable extent the derisive mirth of the local fishermen by wading up the middle of the stream, rigged out with tackle, etc., from London or New York, and armed with ten foot fly rods, landing nets, and creels. The scorn of the old "boss" fisher of the mountains knew no bounds. I can well picture to myself old Jessie rouring with laughter from beneath his vast forest of beard and whiskers as he laid the small hook of a black gnat upon his rugged palm, "What! eatch trout with that 'ar hook and bit of feather?"

However, catch trout they did, and as old Jessie in these days now says, "They pinely raked 'em.'.

Since that day the superiority of the fly has been unquestioned, and even greatly exaggerated; too much stress being laid by the mountaineers on the lure itself and too little on the manipulation thereof.

Other gentlemen from a distance have since sought the spot—a new angling era opened—and now the talk along banks is not of peles and snoods and stick baits and such like barbarous jargon, but of each-y-bondus and red spinners of reels, fly rods, and casting lines, while for a half worn out fly a lad will willingly carry your basket and net all day. Old Jessie confesses that his reign is o'er, and that 'em' ar fellals from the low country can beat us all with their darmed flies and fixin's." Jessie occasionally fishes with a fly under protest, but he likes somehow or other to be alone at the time. Whether he designs to play his fish has not been fairly ascertained, but it is supposed from the rapidity with which the few flies he can get hold of vanish, and from the amount of "whates" that he "hangs," but "break away," that his treatment of his fish is not of a yielding order.

The simmering hours of noon swelcered by, the most enthusiastic angler to wind up his line, lay down one of us, I believe I am correct in saying, even rise a trout. The simmering

feeling arises that almost ninkes you shiver, and a gray light steals over the water that tells the angler his time has come.

A bile of flies comes sailing down the current between the moss covered rocks and down into the long still pool we have so long been sleepily watching, till plash, plash, its long unruffied surface once more breaks into life, and as the circles widen and disappear, our energy and arlor return, and shipping off a woodcock for a concliman we turn our faces down stream, and try with probable success the pools and riffles that had appeared so tematless in the morning. Thus it was on the day in question; the evening feed, and a very short one at that, was our only chance of scoring. At every turn during this short interval one met a brother of the angle who had hurried down from his corn patch high above our heads, dragged his ponderous sapling from its hidden corner in some try thicket, and was thrashing unmercifully the surface of a well remembered pet pool with the discarded remnants of a "coachman" or a "miller." No anwhipt stream was this 1-mo unsophisticated trout were these !-but highly educated specimens of the finny race, and carefully instructed day by day. An open water near a Scothish border town is not more thickly lined upon a fast day than is this laughing, brawling river at certain times of the day and season, but it is none the worse for that; in fact, since the bed-ticking(*) business was stamped out it is said the trout have actually increased. We only caught twenty-five between the three of us that evening, but on the other hand it must be fairly admitted that they were twenty-five trout, not five trout and twenty troutlets, as is often the case in such streams, and weighed exactly eight pounds. On arriving at dark at our quarters we found Zach away at a hole where a week previously he had landed a trout of the astonishing size (for he parts) of two and a half pounds. Since then he had hung and lost, according to his own account, several "thumpers" in the same pool by who

(*) A method the mountaincers had of staking a bed-ticking a pool and scooping the fish out previous to the State fish law.

of his white hickory pole might be seen by travelers along the wagon road long after darkness had fallen and the stars peeped forth. Ill-tongued fame has it that many of Zach's highly prized and hard gotten flies sail backwards and forwards thro' the clear depths of that pool firmly imbedded in the grim jaws of monster trout. Another report afterns that Zach was one night seen prone on his face at the brink of the pool grappling with what was supposed to be, in the darkness, a gigantic fish, when suddenly there came a splash, followed by a dead silence, and then the surrounding forest was addressed with an oration that, according to my informant, was evidently more suitable for the time and place than for these pages. But Zach is as good a sportsman as ever breathed. Reared among pot-hunters that had never even heard of a fly, and one of the most successful bait fishers of his district, as soon as ever the nobler art was introduced among his people, his sporting instincts were superior to all native prejudices, and flinging aside his bait box and his hooks, he began with the disadvantage of rough tackle his sporting ifto over again, and has become, as far as hooking trout go at any rate, a very fair fly-fisher: he is a boisterous advocate of his new craft and amusingly contemptuous of any other. The next morning showed signs of rain, and I started off alone, commencing about a mile above the house, where the fall was particularly steep, and forming thereby a succession of as perfect pools as the eye of angler ever gazed on. The first half-hour promised to be a repetition of the preceding day; not even a rise came to cheer me. On a sudden, however, a slight spattering of

off alone, commencing about a mile above the house, where the fall was particularly steep, and forming thereby a succession of as perfect pools as the eye of angler ever gazed on. The first half-hour promised to be a repetition of the preceding day; not even a rise came to cheer me. On a suddon, however, a slight spattering of rain began to fall, and at the same moment a heavy bite of flies came sailing down the water. Flop went a trout in a tempting spot beneath a rock where I had in vain made many casts. In an instant I felt a new man, and drying my flies with a sweep in the air, dropped the leader about a foot above his nose. In less time than it takes to relate it I was fast in a game half-pounder, which in due course was safely basketed. The pool was not twelve feet wide, but fishing up-stream and landing my fish at the tail I managed to take two more half-pounders out of it—an unusual contribution for so small a space. In the course of the next hour several more fish were basketed and many lost from want of a landing net, after which they all but stopped feeding. Wishing to become acquainted with the stream, I fished rapidly up in a desultory manner thro' a drizzling, misty vain, to where its size became such as was eminently more suited to a worm than a fly. Eating a leisurely lunch and strolling back again to the head of the best water I commenced fishing down, and at the same time the rain began to fall in earnest. The discomfort of a stream of water pouring through the crown of a straw hat and racing down my back was, however, soon more than compensated for by the way the fish began to rise. What would I not have given for a landing net. I fastened a fish in every likely place on which my flies fell; and the river here was one long succession of likely places, and free from brush withal. About four o'clock the water thickened and put a stop to all fly-fishing for the creal, Such was the writer's case for the rest of that evening. No trout could have risen better. I fastened a fish in every likely plac

his earnest solucitation with some feathers, dubbing, etc., that had lain undisturbed in my book since the days when I was infatuated enough to scorn using bought flies, and to consume a good many precious hours that might have been better spent, in manufacturing my own.

I have before alluded to the semi-superstition with which ignorance has invested in these mountains the artificial fly. On an adjoining river the largest riparian owner happens to be a professional man, and I presume an educated one, or by way of being so. Two onlies of the best water this enlightened being preserves specially against the use of fly. For bait fishing he gives permission freely. O, ye gods! When was there anything to approach this. The relapse of the civilized savage to barbarism is nothing to it. A preference I have heard expressed in these parts for bad roads over good ones because the latter are conducive to overdrawing, is a patch upon it. The rejection of a railroad offered to the inhabitants of the Upper James is, perhaps, the only instance of ignorance and conservatism combined that can in any way be mentioned in the same breath. However, to see trout in out of the way places preserved at all is something, though the above mentioned is certainly a remarkable commencement for a proprietor to make.

As I rode home regret was the nost prominent of my feelings that I had let so many years slip by in ignorance of these waters, and neverbefore did I so heartily endorse the will worn line that old Virgil, I think, left us:—

"O mihi prectentos referat sicJupiter annos."

"O mihi prætentos referat sieJupiter annos RINGWOOD

A MISSOURI BEAR HUNT.

MUST go over to that fellow, or he will blow all his brains through that horn. It must be Anthony, or Wills, for no other one of our party would nake such a fuss over the killing of a deer." Suiting action to thought, I rode over to where the man was tooting his horn so increasely. On rounding a dense briar thicken. The man was too the party of the p thought, I rode over to where the man was tooting his horn so vigorously. On rounding a dense briar thicket I eame in full view of him. "Pre got him," were the first words that greeted me as I came in sight. "Got what?" I asked. "A bear." "A bear, where?" "Here he is, pointing to the hage carcass of a black hear that lay motionless in the edge of the thicket. "How did you kill him?" "Well, you see that little hickory tree. I was standing by it, expecting every minute to see a deer come sneaking out of that thicket, when all at once I

heard a crackling of the brush, and looking around saw that fellow come galloping along, right towards me. I stood still, and when he got to that old log I let him have it. I was a little scarcd, and you see I nearly overshot him, but the ball broke his back, and down he came. I loaded up as soon as I could, pouring down the powder without measuring, and then pushed down the ball without any patch, I thought it took melonger to load than ever before, and then I let him have it in the burrof the ear." The slayer of the bear was none of our party, but a tall, sunburned son of the sunny South, who was camping and hunting in that neighborhood, and was at that moment a happy man. That evening and the next day we feasted upon the bear-hunter's favorite dish, bear's liver, well seasoned, and partly broiled on a stick held over the coals of the camp fire, then covered with what hunters call the "can fat" from the bear, and again held over the fire until well cooked.

"can fat" from the bear, and again held over the fire until well cooked.

We were a party of five on our annual hurft. For twenty years has "Mestier" roughed it in the camp for from three to six weeks out of every year, always being greatly benefitted thereby. Hunting to me is a pleasure, although I work hard from peep of day until after sombernight has claimed the forests for its prowlers. In rain, in mid, in sunshine and cold, every day when in camp, except the Salubath, is put in in hunting or fishing. For the last eight years we have hunted in Sontheast Missouri, sometimes in "Nigger Wool Swamp" and sometimes on Little River. The principal reason why our faces have been turned in that direction is from the fact that we found a railroad on whose magnificent coaches we were welcomed, and whose officers seemed to take pleasure in giving us accommodations. No railroad in his country offers better hunting facilities for the sportsman than the St. Lonis, Iron Mountain and Southern Railway, When you have your game the agents, conductors and baggagemen take every pains to help you get it home fresh and clean. Sportsmen all know how eager we are to get to our families a deer fresh, clean and life like, just as dressed on the clean leaves where it fell. Mr. O. W. Ruggles, General Passenger Agent, is efficient, gentlemanly, and ever on the alert in the interest of his passengers. But to the hunt! We had made unusual preparations.

like, just as dressed on the clean leaves where it itell. Air. O. W. Raggles, General Passenger Agent, is efficient, gentlemanly, and ever on the alert in the interest of his passengers.

But to the hunt! We had made unusual preparations for this year's sport. While hunting last winter at a friend's house in Arkansas, I fåd discussed with him what would be a killing rille, and on my return home wrote Mr. Van Dyke in the premises. We had settled upon a Winchester, between their '73 and '76 models, 30-inch barrel, 60 grains powder, and 360 grains lead, and had induced them to make me a gun to that order, and, in my opinion no gun was ever manufactured that provided a truer or more deadly weapon. It is absolutely accurate, shooting as close at any distance as ever did the famous Kentucky target rifie; and when you get over 100, and up to 200 yards, it requires no elevated sight or allowance for distance, but will put its ball where you hold it; and from the well proportioned load it does not jar you. It is a killing gun and will be largely used in the South. Their '73 model is an exceedingly satisfactory gun, and for close shooting is a paragon of perfection. Mr. Wills, one of our party, and an excellent rife shot, used a '73 model, with which he would lift a squirrel's head in any tree. I saw hins sit in the tent and knock a squirrel out of a tree full ninety yards distant, hitting its head. He killed five out of the first six deer shot at with it, and a turkey less than 150 yards from him, if still, was in a dangerous proximity to him.

We were indebted to Col. 1, A. Lindsay, a true, generous, whole-souled gentleman of the South, for teams and hunting horses. If open-handed welcome constitutes hospitality, then are the people of the the Southern States entitled to that meed of merit from the sportsman of the North. They take us by the hand and give us abundantly of their stores. Isaac was cook, and Jo, boy of all work. We were each provided with a riding horse, had two wagons, an eight ounce, lifteen foot square

left the habitation of man and sought the wild seclusion of beasts of the forest and birds of the air.

On Nov, 19th we broke camp where we had been deer hunting and started for the bear regions. We found the parties with whom we had arranged for bear dogs in readiness for us, and soon we were in camp on a river in the swamps of Arkansas. The land was densely set with a heavy growth of timber, briar, and cane patches. The first norming out we counted forces and found that we mustered nine nen and twenty-three dogs. Messrs. Eli Bradsher and Major Godby seemed to be the bear hunter's, par excellence, and to them was given the control of the hunt. When about six miles above Camp "Guess," the reliable old start dog, showed evident indications that Bruin had been there. Very soon he gave tongue as he nosed on a log where the bear had walked the night before, and in a jifty twenty-five dogs were trying to see which of them could make the nost noise. The trail led into a canebrake, and when the dogs got half way in they jumped the bear and strung out with nine men following them at break-neck speed. The bear kept the heavy came for several miles and then struck green and blackberry briars so dense that it seemed for possible for man and lorse to follow. The home of the black bear is in the roughest and most successible places that can be found. He delights in an old "deadening," or windfall, that has grown up with green and blackberry briars, and, when hunted with there, who we have the successible places that can be found. He delights in an old "deadening," or windfall, that has grown up with green and blackberry briars, and, when hunted with there, who we have a successful places where the beauth and the bear hand the bear had blackberry briars, and, when hunted with the second of the black bear is in the roughest and most naccessible places that can be found. He delights in an old "deadening," or windfall, that has grown up with green and blackberry briars, so dense hat it ascened for black bear is in the roughest and most naccessine places that can be found. He delights in an old "deadening," or windfall, that has grown up with green and blackberry briars, elbow brush, and vines; and, when hunted with dogs, always runs through the thickest part of this kind of country. The denser the briars, brambles, and canebrakes, the more certainly will they take to them in their effort to escape man and dogs.

brakes, the more certainly will they take to them in their effort to escape man and dogs.

I was mounted on a compact, fleet and sure-footed horse, that became electrified with excitement the moment the dogs started, and seemed determined to keep up with them. I had listened with attentive ear to the conversation of old bear lumters, and had come to the contesion that the best way for a novice to be in at the killing was to trail some old experienced hunter. When the chase began I pulled my horse behind and in the wake of a well mounted and recognized hunter who had the reputation of being a bold rider. We jumped logs, made roads through canebrakes, green and blackberry briars, vines and other impediments, all the time going at a speed that indicated insanity on our parts. On we went until, as we thought, we had left all the party far behind; now and then overtaking and passing some of the slower dogs. We had run some five or six miles when just ahead of us I heard a man urging on the dogs. Look-

ing, I discovered from the speed at which he was going ing, I discovered from the speed at which be was going that to be in at the killing I would have to abandon my leader and overtake the man that was outrunning us. The first opening in the woods that offered a reasonable hope I slackened my pull on Selim and away he went until he came up with the man. For about two miles I followed him, then from the excited manner of the dogs I judged that they were about up with the bear. Again pulling Selim from behind and touching bins with my spur we were soon up with the leading dogs, who had overtaken and were lighting the bear. Ah! grand indeed is the wild music of the dogs, rolling in the car in a wild tumultuous Babel, when you know that they have overtaken and are baying a bear, the noblest car in a wild tunultuous Babel, when you know that they have overtaken and are baying a bear, the noblest of all game that is hunted with dogs. Running up to where they were, I saw the bear take to and climb a large black gum tree. I jumped from my horse—drew my revolver (an army size Smith & Wesson) and was in the act of shooting when I felt a hand laid on my shoulder and heard a voice exclaim—'Don't shoot!' Turning, I recognized my last companion in the chase who had ridden a "John Gilpin" race as well as myself. It was of no use, however, to urge me not io shoot, as I had traveled several hundred miles to kill a bear, and in fact my nerves were tingling with excitemyself. It was of no use, however, to urge me not to shoot, as I had traveled several hundred miles to kill a bear, and in fact my nerves were tingling with excitement. I shot once—twice, and down rolled Bruin. The dogs covered him, and it was then apparent why my friend had requested me not to shoot. It looked as though the bear would kill the entire pack of dogs, as he was making frantic efforts to get them within his grasp. I ran up and putting my pistol close to his head—pulled; but the cap failed to explode. By thus time my two friends in the chase were down, and running up, poured broadsides into the struggling bear that settled him. I was then informed, and had it demonstrated that a wounded bear was a dangerous animal when huntred by a pack of dogs. My two shots had taken effect; one just behind the shoulder and the other in the neck. The one in the body would have proved fatal before the bear could have got away, but did not deprive him of the use of himself sufficiently to have prevented his killing the dogs. The hunters came straggling in, coming to the sound of our horns. Each had his mishap to tell that prevented him from killing the hear. On looking around we discovered that we had killed him within a half-mile of camp. We sent for a yoke of oxen, hitched the chein into the bear's mouth and "snaked" him ithe cone. camp.

the chain into the bear's mouth and "snaked" him into camp.

One other exciting chase, and I will leave your readers to kill their own bears. A Mr. Winingham, who lived on the river above our camp, came down and told us that bears were abundant about his place; that he had been feeding one all fall on roasting cars. We moved up and pitched our tent in his yard. The next morning we started, and when about a mile back of his field the dogs struck a cold trail. From the manner in which they trailed, the knowing hunters said it was an old she with her cubs. Often the dogs would be following at the same time two or three trails that ran parallel with each other, and would all come together again. Welhad been following them for a mile or more, when all of a sudden some of the leading ones went off with a cry and rush that told they had jumped the bear. And now the race began, That morning Major Godby had given us notice that he intended killing the next bear. When he started I pulled Selim in behind him and trailed him for two miles; then, seeing that the Major's hores had about pegged out, it was but an act of prudence on my part to give him the go-by. I watched until I saw the dogs make a turn, and the Major at the same time going straight ahead into a briar thicket, from which he could not extricate himself, but would have to go through it. Without notice to him, I gave Selim a pull in the direction that the dogs lad taken, and away we went, leaving the gallant Major struggling in the briar thicket, I ha bout half a mile the dogs overtook and brought to hay the bear, and when I came upwere fighting him. When pressed by the dogs the bear turns to fight, and the trained dogs, watching every opportunity, fy in and nip the bear belind. The bear, we have the weet of the portunity fy min and process the process of the dogs over took and brought to hay the bear, and when I came up and away we went, leaving the gludant astor strugging in the briar thicket. In about half a mile the dogs overstook and brought to bay the bear, and when I came up were fighting him. When pressed by the dogs the bear turns to fight, and the trained dogs, watching every opportunity, fly in and nip the bear behind. The bear, curning to fight the dog that nipped thin, is again nipped by another dog who has been watching his chance, always keeping away from his head. He stands this as long as he can, and then starts to get away from his noisy tormentors. No sooner does he got straightened out than he dogs again come up to him and again commence nipping him, and he again turns to be again nipped by another dog. And this goes on the again nipped by another dog, And this goes on the again nipped by another dog. And this goes on the fighting I saw that it was a monster of a bear, and at the first opportunity commenced shooting. In this we have to be carroid, as the dogs are circling around the bear and there is great danger of shooting them. I shot three times, and then he made for a briar thicket near at ham. I saw I could not follow him in it, and I ran around to where I thought he would come out. Just as I got to the opening I saw him coming not more than thirty feet from me. I shot without apparent effect. On he came right toward me, and when within ten feet of me! gave him a second shot that struck him in the eye and saylies thin as accound shot that struck him in the eye and saylies in the strongelse of death as he had been in his deflance of dogs and man while in life. The sun was shing of beauty, and as majestic in the strongelse of death as he had been in his deflance of dogs and man while in life. The sun was shinging bright when I came up to him, it being one of those baleyon November mornings peculiar to the South. He was between me and the sun, and his glistening black form showed like satin in its soft rays. Soon the hunters came up, and all agreed that it was the fattest and largest bear that they had se rays. Soon the inducts carried that they had seen for years, averring that it was "Winingham's corn-led hear." We dressed him on the ground, and on measuring found that he "cut six inches," that is, six inches of pune fat in thickness on the loin between the skin and lean neat, He had killed one of the dogs before I got up to him. We did not miss the dog until after we had started to camp. The next day we went to look for him, but could not find him. A few days after I returned home I received a letter from one of our party who had renained for a few days' longer hunt, saying 3 "I found Col. Linkays' dog dead; he was bitten through the shoulders; he was on our trail, near the bunks of the Broad Moulis." The dog had followed us back about two inlies, but had not strength to get it camp. In the same letter he says, "We killed eight bears after you lett. We had fine sport and generally long choses. We did not kall any that would have compared with your champion of the Winingham neighborhood." The mother and cubs that the dogs were then trailing when they jumped the Winingham bear escaped by the dogs all taking after him. And now, to sum up, we killed three bears before we left and thirty-two deer; a gray engle that measured seven fect from tip to tip; turkeys, ducks, coons, swamp rabbits, squirrels, woodcocks, qualis, etc., etc., and are now at home enjoying with our families the trophics of the hunt MESTIED

Matural History.

THE BIRDS OF CHESTER COUNTY, PA.

RV B. HARRY WARREN.

(Concluded)

143. Plectrophanes nivalis, Meyer-Snow bunting: occasions

resident; gregarious.

144. + P. lapponicus, Seiby—Lapland longspur; "winter resident; very rare."

145. Passeredus savanna, Bonap.—Savanna sparrow; common;

arrives April 18th to May 1st.

14th, Proceedes gramineus, Baird—Bay-winged bunting; common;
-arrives March 20th to April 10th; during mild winters is some-

times found. imes found. ¬ 147. Coturnicalus passerlaus, Bonap.—Yellow-winged sparrow;

141. Continuous passestimos bondin. Petrowwinger spartfuy; frequent; April 20th to May 1st. 148. *C. henslowii, Bonap.—Houslow's bunting. I have never seen this species. Mr. P. G. Wickersham, of West Chester, informs me that he now has three ergs of this bird, taken near West Chester, Pa

149 Zonofrichia leuconbrus, Swainson—White-crowned sparrow:

180. Z. abicalis, Bonap.—White-throated sparrow; abundant in spring and fall, but not abundant in winter.

131. Passer domesticus, D and G.—English sparrow; abundant resident. By all practical, unbiassed observers in this locality resident, abundant in the speed of the sparrow. resident. By all practical, unbassed observers in this locality this species is propulated a pest, and its speedy readication is generally hoped for.

182, Juneo hjematis, Scial.—Snow-bird; abundant winter resident; arrives in October, departs by May 1st.

183, Guiraca ludorielland, Swaltson—Rose-breasted grosbeak, I

155, Garraca more reading, Swamson—nose-pressed grosponar. I am advised by M. B. Byerbart that this species about eighteen years ugo bred somewhat commonly. Mr. E. on several occasions found their nests with eggs and young; several of the latter were taken. One was kept as a pet four or five years. The last in-stance of its midification in Chester County of which I have stance of its innearron in Joneser County or winer I have knowledge was near Deboralt's Rock, East Bradford Township, on the property of Edge Cope. There a nest and three eggs were found by Titus Bennett, of West Chester. I think this find was In 1875. I have observed this bird as a migrant, nor rave, arriving m May 16th to 27th.

154. + G. corrulea, Swainson—Blue grosbeak; "summer resident: very rare" (Michener). I have never met with this bird in the

country. 155. Cyanospiza cyanea, Baird—Indigo bird; abundant; arrives

May 4th to 13th. . Cardinalis virginianus, Bonap.—Redbird; abundant resi-

dent.

157. Pipilo 'crythrophthalmus, Vicill—Chewink; abundant; arrives April 18th to 30th. This bird occasionally feeds on the Colcrulo beetle. Last summer I dissected a male bird, which rerealed two or three of these beetles.

158. Dolchoury orgitowns, Swainson—Bobolink; reed bird; com
mon; migrant; arrives May 8 to 15.

169. Molothrus peoris, Swainson—Cow bird; abundant; arrives
March 27 to April 12. Mr. H. Garrett, of Willistown, has noted

Marcia 2 to April 2 and in content of wintsown, and noted this bird as no occasional winter resident.

160, Agolatus pheniceus, Vieill—Red-winged blackbird; abundant; arrives March 2 to 30.

161. Sturndla magna, Swainson—Meadow lark; abundant; resident.

162. Ictorus spurius, Bonap.—Orchard oriole: common: arrives

180 to May 5.

I hallimore, Daudin—Baltimore oriole; abundant; April 28 to May 4.

164. Scolecophagus ferrugineus, Swainson—Rusty blackbird; com-

101, conceptuage for squares virtuales and the states and the square for mon; migrant; arrives March 8 to April 7.

165, Quisedus versicolor, Vicil—Crow blackbird; vory abundant; semetimes winter resident.

166. *Corpus carnivorous, Bartram—American raven; "very

167. C. americanus, Aud.—Crow; abundant; resident.

161. C. Control Trans. Nature 1704, and many resident, 188. 4C, ossifranga, Wilson-Fish crow. I have understood that a nest was two or three years since found by a ollogist of this place along the Brandywine Crock. Michener says it is a "resident way." dent, rare. 169. Cyanura cristata, Swainson—Blue jay; resident; much more

169. Cyantar arisanta, Swanson—Bute jay'; resitent; muen more numerous in summer than winter. 170. Ectopistes migratoria, Swanison—Wild pigeon; small parties appear in the spring and fall. 171. Zenabitra carolinensis, Bonap.—Carolina dovo; abundant resident; two broods.

172 *Welcouris gallongro, Linn. - Wild turkey: resident in years

172. Auterogres panaparos, ann.—" was trave; resident in years gone by; now extinct. 173. Acupidania cupida, Baird—Pinnated grouse; "resident; now becoming extinct in this country." (Michener.) This decidedly Western species we have never met. Our oldest sportsmen and several ornithologists say they never knew or heard of the prairie hen occurring in Chester County. Barnard does not give it in his

cntalogue. 174. Bonasa umbellus, Steph.—Ruffed grouse: common in ce sections; resident.

175. Ortyv virginiumus, Bonap.—Quail; resident; common; fre-

The Orther programmes, Bonap,—Quini; resident; common; tro-quently collect in large flocks and migrate southward. 176. Coturnic communis—Migratory quall. In the early part of June, 1878, intery-five of these birds were liberated in the several townships about West Chester, but as yet we have no positive proof of their breeding. 177. "Grus anxerteanus, Ord.—Whooping crane; "not common."

177. *Grus americanus, Ord.—Whooping crune; "not common." This species I have never seen.

178. *Garzetta cauditissima—Snowy heron; rare migrant.
179. *Herodits epretta, Gruy—White heron; "seldom found."
This species I have never seen in Chester County, but have a specimen taken in Lancaster County, Pa.
180. *Ardea herodias, Linn.—Great blue heron; frequent migrant; arrives April 2 to 15.

181. *Botaurus tentiginosus, Steph.—Bitteru; frequent migrant; April 7 to 22. *A male of this species, taken Dec. 8, 1879, along the Brandywine Creek; is now in my cabinet.

182. *Rudribs stressens. Bonap.—Green heron; nhumdant ap.
183. *Rudribs stressens. Bonap.—Green heron; nhumdant ap.
184. *Rudribs stressens. Bonap.—Green heron; nhumdant ap.

Isr.—One prairie hare (Lepus campestris), two kit foxes (Vul-pes velox), five California ground squirrels (Spermophilus beccheyi) one raccoon (Procyon loter), one 'opossum (Didelphys virgina e naccount row grant count, one opossim (practings rightanus), e golden eagle (Aquila canadense), three horned owls (Bubo pfutsnus), one real-tailed hawk (Buto borcatis), one scarlet flus is rubra), one prairie chicken (Capidonia capido), all presented? one golden cagle (Aouila one brown coati (Nasua nasica), received in exchange; five undu-lated grass pairakeets (Melopsittacus undulatus), batched in gar-FRANK J. THOMPSON, Superintendent.

THE BIRDS OF MEXICO. - Our correspondent, A. W. B. has been quite successful in collecting specimens of Mexican birds. He writes from the City of Mexico under date of Jan. 12th :-

of Jan. 12th:—
Owing to pressing business I am compelled to return to the United States by next steamer. My collections are quite extensive, and I believe are the most complete ever collected in this valley, and are nuch finer than those in the National Museum, this city. I shall return perhaps next winter to work up the birds of the Atlantic scaloard, of which the history thus far is very incomplete. Prof. Sumichaust, of the Smithsonian Institution, has just forwarded me a letter from Tehuantepec to spend the summer with him, which I was compelled to refuse. I shall leave an agent here who will forward specimens to my collection. My next trip will be from Fembina. Dakota Territory, up the Red River of the North, and if possible to Lake Winnipeg or Hudson's Bay; start June 20th.

WILD BIRDS IN CONFINEMENT,-We are kindly permitted by the recipient of the following letter to publish it for the benefit of our readers. The experience of the writer is a most interesting one, and we hope that his example may be followed by those of our readers who are interested in our game. Much valuable knowledge anent many of our most interesting game birds might be gained in this way :-

gained in this way:—

My DEAR Sin: Your very kind letter of 11th to hand. In reply I beg to say I don't care a fig whether they are spruce birds or ruffed grouse, for I can keep either or both kinds in capitivity. Two years ago last winter I wintered four ruffed grouse, and in the spring they laid sixteen eggs; but whon setting time came they quarreded about the one nest that the coop contained, so I took the eggs and put them under a bantam, hatching some half-dozen, and some of them lived to be two weeks old, but finally died one after another, as I did not then understand their food. Last April a friend at Houlton, Me, sent me a pair of spruce birds, but the cock died soon after arriving. The hen laid four unimpregnated eggs,

and sat on them five weeks! She is now moulting, but smart and lively. Now if you can get me any of either kind I shall be glad, and I hope you will be able to tell the cocks from the hens, and attach a small tag to the leg of the former so I can tell them, as I cannot always tell them apart. I am a cripple, and have been for five years more or less. I have been absent all summer in search of health, visiling many parts of the West; but I really believe that a trip in the woods with you would do me more good than anything else.

I have a fine yearling buck caribou, tamer than a cosset lamb. I have four deer, two bucks, one doe and a splendid fawn eight weeks old. I have a fine old raven, four years old, from Sheffield, England; also a this year's young one, bred on the rocks on an island off Machais, Mc. I have a pair of fine English ferrets, and next week I expect to receive from Hot Springs, Ark., a full-grown, tame white possum, which is as rure among their numerous possums there as a white squirred is with us. I shall also receive along with the possum a fox-squirrel, jet black, with the exception of a white ring encircling his body just back of the forelegs. Now can't I coax you down here to see me and my specimens of natural history? I have also some nicely mounted animals and heads.

M. W. Clark,

Danville Junction, Me.

Denville Junction, Me.

Wandering Webs.—Maysville, Ark.—I notice in your issue of Dec. 4th a communication from a correspondent in Milltown, Maine, speaking of showers of web floating in the air. Such phenomena are of frequent occurrence here, and are supposed by many to herald the coming of the Rocky Mountain locust (Caloptenus spretus), but the letter of your correspondent, together with your foot note and the observations of myself and others while in the East, would tend to make one doubt the correctness of this theory. Still these clouds of web in this part of the country are always accompanied by more or less grasshoppers, and as they (the web) come only from the North, West, or Northwest, would tend to confirm many in the belief that they are produced by grasshoppers; and as Professor Wise held that the higher air currents set toward the East, might it not be possible that the webs are carried to immense distances, and even to the Atlantic seaboard? Besides this, many persons claim that these webs are only seen when the hoppers are on the wing to the North and West, and hoppers were reported plenty in parts of Kansas at the same time that immense clouds of web were floating over here, shout Oct. 1st, 1879. So much for theory, now let us have facts from some one who knows. We refer our correspondent to what has already appeared in these columns and to the works which we have cited, for information on this subject.

E. W. Scott.

THE MANATEE IN FLORIDA.—Marietta, Ga., Jan. 31st.—Your correspondent, Mr. Le Baron, in his interesting paper on the manatee in your issue of Jan. 22d, would seen to imply that this animal is not found north of the St. Lucie River. C. J. Maynard, in his "Mammals of Florida," places it as far north as the Indian River Inlet, but "is confident that it does not occur in Mosquito or Halifax lagoons," Halifax lagoons,"

In the winter of 1878 the carcase of a recently killed

In the winter of 1878 the carcase of a recently killed manatce was found in the Halifax River, or lagoon, the skull and some of the ribs of which were procured near the spot by the writer and deposited in the museum of the Chicago Academy of Science, and it is believed by the residents on the Halifax that this animal still exists in the Tomoka and Spruce Creeks, fresh-water streams flowing into the Halifax at least 150 miles north of St.

OTTERS UNDER THE ICE.—Indian Rock, Dec. 19th.—
Otters are as much at home in the water under the ice as they are in the air above it. This is my explanation of their power to travel long distances under the ice without breathing fresh air, though whether I read, dreamed, or was told it, I cannot say. Before the animal dives under the ice he takes in a good breath, and when he needs more air he breathes it out and the air rises in bubbles against the ice and the water purifies it; then the animal just puts his nose up and by some slight movement which I will not attempt to describe induces it again. I have frequently seen where otter have crossed ponds two or three miles wide under the ice, by going in at the inlet and coming out at the outlet.

FRED.
Our correspondent's observations are interesting, but

Our correspondent's observations are interesting, but his explanation is a little too vague to be quite satisfactory.

APROPOS OF ALBINOS.—A partial albino robin was caught by Mr. Drake, of South Cayuga, Haldimand Co., while it was feeding in his back yard, having been left by its companions this fall. It was eaged and seemed to do well for a time, but finally died when he brought it to me. It is beautifully marked, the head and shoulders are pure white, breast mottled white and red, the upper and lower tail coverts are white, as are also occasional feathers in the wings and tail; bill and legs are straw colored. I was glad to preserve the skin and mount it. Some years ago I examined the intestines of a partial albino black squirrel and also a blackbird, which was turning white, and in each I found tapeworms. My robin underwent a like examination, and, strange to say, I found four tapeworms in his intestines.

Query—Is this always the case in albinos?

DROWNING OF CORNING TO THE PROPERTY OF THE PRO

Dunnville, Ont., Canada, Dec. 20th, 1879.

USEFUL INFORMATION ABOUTTHE SKUNK,—Vinablateen, Maine, Jan. 12th.—In your issue of June 12th, 1879, your genial and gifted correspondent "Old Judge," in "Some New Facts on Skunks," makes one statement which I think should not go unchallenged, and with which I take issue. It says: "It is a known fact that the skunk when litted by the tail cannot throw his cologne," etc. Now, with all due deference to the "facts" and opinions as expressed by this gentleman, I can avow most positively that this malodorous animal can throw his perfune abundantly under the circumstances or conditions mentioned. With your permission I will give you and your numerous readers a bit of my experience in this business. Some fifteen years ago, while a young man in

college in Brunswick, Maine, my landlord, Capt. Dresser, came to my room one morning with the thrilling announcement that an "essence pedler" had taken possession of his stable, and that he would like my assistance in either routing him out or capturing him dead or alive. My chum and class mate, Dr. Henry A. Dean, then of Foxboro', Mass., and I immediately repaired to the stables, where we discovered his mephitic highness snugly ensconced in the old gentleman's woodpile. Being of good size he was unable to entirely conceal himself within, and his caudal appendage remained hanging out-side, a most beautifully tempting opportunity for my experiment. Informing my companions of what I had heard or read, I boldly suspended the fellow by the tail, after a hard struggle to extract him from his hole, during which operation he made no sign of the deviltry within him. When I first suspended him he happened to be back to me, but with a quick squirm he succeeded in putting himself face to face with me, when, whew! college in Brunswick, Maine, my landlord, Capt. Dresser, in putting himself face to face with me, when, whew! heavens and earth, what a fog. I remember distinctly that the atmosphere was rendered of a bluish cast by the abundance of the fellow's essence. I remember also that I dropped the scoundrel, and that he made good his escape, leaving only his card with me, but not till he had successfully ruined a nice, brand-new suit of clothes. The charge was, I think, quite evenly distributed from my chin to my toes, the pattern being excellent and the penetration amply sufficient for all purposes. Now should any one have any idea of ever acting upon the information so kindly volunteered by "Old Judge" I simply advise him to don a suit of cast-off clothing, or he will certainly have occasion to replenish his wardrobe. I should give him Mark Twain's advice, "Don't." MEDICUS.

Hish Culture.

ARE AQUATIC PLANTS DESIRABLE IN FISH PONDS?

COUNCIL BLUFFS, Iowa, Jan. 1880.

THERE is considerable question among pisciculturfists, as to whether aquatic plants are desirable in
fist ponds; and this is certainly not a one-sided question.
It is contended, on the one hand, that they should not
be permitted, as they furnish a lodgment for dead fish
which thereby become concealed from observation and
remain in the water until putrefaction takes place, thus
fouling the water and subjecting the living fish to disease.
Also, that they afford a shelter and concealment for the
innumerable enemies of fish; and, again, that certain
portions of the plants are continually breaking off and
becoming decomposed, thereby fouling the water; that
fragments drift against the outlet screens, causing them
to become clogged. These are certainly potential arguments, such as the writer is free to admit have deterred
him from making use of aquatic plants. Yet I am fully

ments, such as the writer is free to admit have deterred him from making use of aquatic plants. Yet I am fully convinced after having given the matter full consideration, both pro and con and by experience, that every artificial pond should be supplied with aquatic plants.

It is a well known fact, that in feeding, no matter how much care may be used, a large portion of the food from time to time becomes wasted by reaching the bottom, until in time there is such an accumulation as to render the ponds foul with the humic gas created by decomposition, which necessitates the frequent cleaning of ponds. Thus is known to all practical pisciculturists to be the most laborious and disagreeable work about an establishment; hence, anything that will lessen the necessity of most laborious and disagreeable work about an establishment; hence, anything that will lessen the necessity of drawing off and cleaning ponds should be most eagerly sought after. This, the writer claims, can be largely done by the use of aquatic plants. In this connection it will be proper to consider how and why fish are injured by foul ponds. In the respiration of fish as in that of by foul ponds. In the respiration of fish as in that of other animals, the membrane of the gill organ (the lungs other animals, the membrine of the gill organ (the lungs) absorbs the oxygen and gives out carbon. In the decomposition of both vegetable and animal matter the formation and liberation of carbonic acid goes on with great rapidity. The oxygen and carbonic acid gas becomes mixed, whereby the oxygen becomes tainted (so to speak), and the fish are unable to obtain sufficient oxygen for the purpose of respiration. Now, it is a well known fact that the respiration of plants is the opposite of that of animals. That is to say, they take in carbonic acid and give out oxygen. Hence, if we have our ponds well supplied with aquatic plants, they will absorb the carbon respirated by the fish and given out by decomposition, as the same is taking place; thus, in a great measure, preventing the ponds from foulling. Almost any aquatic plant is good for this purpose, but more especially the plied with aquatic plants, they will absorb the carbon respirated by the fish and given out by decomposition, as the same is taking place; thus, in a great measure, preventing the ponds from fouling. Almost any aquatic plant is good for this purpose, but more especially the simpler forms of algae, such as conference. In connection with aquatic plants, I would recommend having gasteropeds (smils) especially the limnaca and planorbis (pondianis). These will consume the vegetable matter continually given off by growing plants and the multitude of spores (seeds), particularly of conference, which would otherwise soon fill the water. I should also recommend putting in the pond a few bottom-feeling itsly, such as the actipenser (sturgeons). This would, in a great measure, prevent waste in feeding. By using aquatic plants in the manner above directed the writer believes that ponds would searcely ever require cleaning, and that, perhaps, by the occasional use of some harmless disinfectants cleaning would never be necessary. As to this I cannot now say, but I am about to make an experiment in this direction, the result of which I will make public in due course of time.

by the celeaning would never common say, but I am about to make an edirection, the result of which I will make public in course of time.

In addition to the benefit of keeping the ponds pure, aquatic plants are in a number of ways useful. They help to supply the fish with food, more especially when young; afford them shade, and shelter them in case of ailment against the rapacity of their comrades. Who has not noticed when a fish in the pond is in the least ailing that almost innumerable other fish will nibble away at him until the poor fellow expires, literally for want of rest? In cases of this kind the aquatic plant is wrotection.

want of rest? In cases of this kind the aquato panda fine protection.

In conclusion, the writer will state he has two ponds exactly alike, containing fish in the same quantity and of the same age. The one is considerably sheltered from the light and contains no aquatic plants; the other pond is open to the light and filled with plants and snails (timized). In the latter the fish are fully double the size of those in the former. The fish are in perfect health and the pond has not been cleaned since last spring.

WM, A, MYNSTER,

CALIFORNIA SALMON FOR THE MISSISSIPPI.—Jacksonport, Ark., Jan. 20th.—Editor Forest and Stream:—
Over a year ago the writer, through FOREST AND
STREAM, called attention to the fact that on the White
River of Arkansas suitable waters for the spawning of
the California salmon could be found several hundred River of Arkansas suitable waters for the spawning of the California salmon could be found several hundred miles nearer the gulf than on any other tributary of the Mississippi. Of course no opinion was ventured as to whether the waters of the Lower Mississippi could be safely passed by this fish, whether the temperature of the gulf was such as he could endure, or whether the food supply there would be found suitable and sufficient. These matters can only be settled by extended experiment. A short time since I was gratified to see in some of the Missouri papers an account of the planting of the larger part of 100,600 salmon in the waters of White River, they having been considered by the Fish Commissioners of the State more suitable than other waters of the State. This is a move in the right direction, but is a very small beginning. At least 500,000 young tish should be placed in the stream each year for five successive years before the experiment can be said to have been fairly tried. In view of the difficulties in the way and the magnitude of the enterprise this would not be too much. Success even at that rate would be cheap enough. Firmly believing as I do that it would not be impossible to stock Mississippi waters with the California salmon, I am anxious to see a systematic attempt made. Will FOREST AND STREAM agitate the question?

Wisconsin—Madison, Feb. 2d.—From an interview with President Dunning, of the Wisconsin Fish Commission, we learn that there will be ready for distribution in the spring, at the Madison hatchery, about one million brook trout fry, and that parties desiring them should immediately make application to any one of the members of the commission, or to the superintendent of the hatchery, stating in the order the number of fry desired and giving the name of the railroad station nearest to the point of delivery. The superintendent will notify parties before the day of shipment, and they are expected to be prepared to receive the fry at the depot and transport ties before the day of shipment, and they are expected to be prepared to receive the fry at the depot and transport them to their destination. The names and residences of the commissioners are as follows:—Philo. Dunning, President, Madison; J. V. Jones, Vice-President, Oshkosh; C. L. Valentine, Secretary, Janesville; H. W. Welsher, Superintendent, Madison; Mark Douglass, Melrose; John F. Antisdale, Milwankee; C. Hutchinson, Beetown.

Royer.

Nebraska.—The fish turm of Messrs. Romine & Decker, on the Platte River, two miles from South Bend, is thus described by a paper of that States—Mr. Romine, some time ago, conceived the idea of hatching fish in the beautiful clear spring water, which flows from the high bluffs on his farm to the Platte River. He therefore procured some of the best spawn he could find, and, preparing at considerable cost a fine pond, placed them therein. Their healthy progress, and Mr. Romine's success in cultivating the finny tribe, drew the attention of those interested in this business, and in a short time, spawn was sent to Mr. Romine to be nursed under his, spawn was sent to Mr. Romine to be nursed under his, care into fish. He then took in with him his present partner. Mr. Decker, a gentleman who had some knowledge of fish culture, and their joint efforts are as follows: They have now hatched 90 per cent of the 200,000 spawn received from the U. S. Fish Commissioner. This spawn was received in Oct, 1879, and they have in their hatching department now, 100,000 spawn, 50,000 of which are living fish, swimming about, and are in good healthy condition. They have in their lower pond 1,000 two year old trout, which weigh about one and a half pounds. They have also in the second or middle pond about 10,000 yearing trout, v h'ch weigh about one pound, also 25,000 about eight months old, all in the finest healthy condition. The two heautiful springs of clear water flow continually into the different sluices leading to the ponds, the body of water at the main outlet being 27 cubic inches. In speaking with Messrs. Romine & Decker, we learn from them that their facilities are comparatively wasted, as they can accommodate and cultivate with care and success ten times the anount or number they now have, as the natural facilities they have at their place are not near utilized. A more beautiful place or a better opportunity was never presented for the culture of all kinds of near utilized. A more beautiful place or a better oppor near utilized. A more beautiful place or a better oppor-tunity was never presented for the culture of all kinds of fish than that of Romine & Decker, and we trust that our fish commissioners will do their best to have those fine natural advantages for fish culture fully taken ad-vantage of. What is now wanted there is the spawn of the German carp lish, and such other fish as grow to a

**Early Methods.—Quincy, Ill.—Editor Forest and Stream:—I have been much amused at the discussions in regard to inventions in fish culture and to see how many

regard to inventions in fish culture and to see how many persons chain my inventions. I am a modest man, and on of often care to see my mane in the newspapers, but as I regard FOREST AND STREAM in the light of a scientific record of fish culture. I am tempted to break silence. For the benefit of future historians of fish culture I will say that in 1850 I look spawn by the dry method, which is now credited as a Russian discovery. In 1841 I need glass jars with wire beams coated with gas tar for latching the eggs of the California schmon, and the following year I used the cones for hatching the grayling. I do not care particularly about pressing my claims to these inventions and merely state them in the cause of truth and correct history, as my work has ever been for the good of the people, and I have never cared to make it a merely personal matter nor to cater for cheap notariety.

Tely a former number of your paper you gave a description of my fish pends under the head of "A Successful Fish Culturist." That is true, I have been a most successful one, and I say it modestly, I have been a source of ideas to others in the business, which they have not always acknowledged; but I am pleased to see them adopt them. I at one time owned 500 miles of nets and employed a regiment of fishermen on Lake Superior in the earlier day when the country was wild, and once while camping in the woods alone wolves and owls kept me awake and in terror, and I thought I should be devoured every moment.

voured every moment.

If I had been eaten up then some other man in some other country would have had to do the fish hatching. I have been making some experiments in crossing the

catfish with the fresh-water muscle, a thing which the men who are called scientists say can't be done, but I have done it. I am sorry that I have not got the young ones to show you, but they are in the Illinois River some SETH PERKINS.

Forest and Stream at the Brein Exposition.—
United States Commission Fish and Fisheries—Washington, D. C., Feb. 4th.—Exitor Forest and Stream:—It is not unlikely that the U. S. Fish Commission may make an exhibition at the Berlin International Exhibition of what relates to the fishery industries of the United States, and it has occurred to me that possibly you might like to exhibit a bound file, complete from the beginning, of Forest and Stream, as one of the journals indirectly connected with the progress of fish culture and fishing in America. The volume could be returned to America afterward, though it would be preferable to present them to a prominent person or library in Europe.

Your striy, Strength F. Baird.

Production and Consumption of Fish.—The follow-

PRODUCTION AND CONSEMPTION OF FISH The follow-PRODUCTION AND CONSUMPTION OF FISH.—The following figures were quoted by Congressman Morton, of New York, in his speech advocating the appropriation of \$20,000 to enable the United States to be represented in the International Fishery Exhibition in Berlin, next April. The figures show the comparative production and consumption of fish by the leading nations of the world!—

FISH IN SEASON IN FEBRUARY

SOUTHERN WATERS.

Pompano, Trachinous carolinus, I Grouper, Epinephelpus nigritus, Drum (two species). Family Tront (black bass), Centrapris-Sclaraide, Stantist, Menthebras nebulosus, Sen Hars, Staropos cerilatus, Sincephead, Archosurgus probatocephetus.

Red Snapper, Lutjanus blackfordit.

GAME AND FISH DIRECTORY.

In sending reports for the Forest and Stream Directory of In soung lepis for ine rouss about a recommendation of Game and Fish Resorts, our correspondants are requiseded to give the following particulars, with such other information as they may deem of value: State, Town, County; inecase of access; Hotel and other accommodations; Game and its Soason; Fish and its Season; Botts, Guldes, etc.; Namo of person to address.

THE CONNECTICET LAKES.—Second Lake, N. H., Feb.—Winter very mild; no prospect of snow enough to as-—Winter very unid; in prospect of show enough to assist in a moose slaughter, as many are inclined to way, Nature will beat legislation in their protection. I have obtained a specimen each of snowy hawk and acadian owls recently. The hotel at the outlet of Connecticut Lake has changed hands, and will be enlarged and repaired as well as the increasing prospect demands. It is now owned by the Conn. River Lumber Co.

EDW. NORTON,

VERMONT—Beauington, Feb. 9th.—The trout fishing for next spring bids fair to be good. At the present writing all the streams are clear of ice. The brooks this winter have kept pretty high, which is a good sign here. The spawning beds last fall were covered with trout: I counted forty on one bed, the smallest of which would weigh half a pound. The season here opens the 1st of May, but as a general thing the water is not low enough for fishing until about the 15th. There is some very large trout here in the creeks and pounds. I have taken trout, with bait, of over two pounds weight, and have seen them caught oven larger. The dye from the Bennington Woolen Mills is fast driving the trout from the Main Branch, and there does not seem to be enough interest in the fishing to have it stopped. G. F. O. MASSACHUSSITS—New Bedford, Feb. 4th.—The remarkably mild weather up to the 1st of February has enabled the fishermen from this vicinity to take large fares of cod and tautog on the ledges at the mouth of buzzard's Bay and off of Westport. Two men in one day hast week caught one thousand (1,000) pounds of this fish on Brown's Ledge. Owing to the same cause, mild weather and want of ice, the cel fishery has been proportionately light. Smelts and a few herrings have appeared.

COCCIA, Bennington, Feb. 0th.—The trout fishing for

light. Smelts and a few herrings have appeared. CONCHA,

"ANGLING PRIZES.—Chathom Village, Columbia Co.,

N. Y., Feb. 6th.—The annual meeting of our little club
for the election of officers and the awarding of prizes
took place on Monday evening, Feb. 2d: T. R. Burrows
was chosen President for the ensuing year; C. D. Hieck,
Secretary and Treasurer; O. M. Whyland, A. J. Fellows
and W. M. K. Burrows, Weigh Masters.

The prizes offered last season were three fly tools
(Russia leather), for the three heaviest bass taken within
a radius of seventy miles of the willage. They were
awarded to A. J. Fellow, O. M. Whyland and C. D.
Hieck. The ceremony was of the simplest possible character. There were no speeches, insanutch as the gentlemen all protested that they were better at fishing that
speech-making, and for proof, pointed to their record.
Therefore, Mr. Fellows, who caught the largest bass
(three pounds, six ounces), just walken to the deels and
fook the first choice, Mr. Whyland the second, which, of
course, deprived the third man of a choice, though not
of a book.

course, deprived the third man of a chose, some consist of a book.

The prizes put up for the coming season consist of a bamboo telescope red, donated to the club by cur new precident, and a waterproof braided silk line.

It was estimated that over 100 pounds of trout had been taken by the club during the last season out of streams in this vicinity; and it was resolved that some evening in the coming season a trout supper be indulged in by the nembers and their wives, the trout to be furnished by the club from their own hooks and lines. Already the most zealous members are polishing their green-hearts, and inspecting their braided silks, snells and flies in anticipation of the event.

Hix, j

A SPORTSMAN'S TENT

[The metric notation in the following article may not be familfar to all our readers. We therefore give the equivalents in feed and Inches; —1 meter, 50.37 inches; I decimeter, 30.37 inches; I decimeter, 30.37 inches; I millimeter, 5031 inch; I kilogram, 2.206 pounds; I gramme, 15.43 grains; I life, 10.37 quarts.]

SIX years having proved the usefulness of this tent under greatly varying conditions, this account is written, as it may be of use to some who, wandering in their vacations among the mountains far from shelter, feel the need of protection from changes in temperature, rain and insects

feel the need of protection from changes in temperature, rain and insects.

In making a tent for exploration several objects were kept in mind:—First, it must be light; second, it must be waterproof; third, well ventilated, else half the benefit of a sojourn among the hills will be lost; fourth, it must afford protection from insects, or in warm climates from reptiles; fifth, the method of pitching should be simple, as on a march it is often desirable to avoid a sudden shower. The tent to be described has met these requirements:—Weight, 3 kilogrammes.

In shape the tent (Fig. 1) is a cone, the height about 2 metres; the diameter of the base, when set up, is 250 centimeters. Fig. 1 shows it hung from a branch.

Many times in a forest country this method can be used, or if a branch cannot be found then a simple way is to fasten to a pole field between two trees about 3 metres apart. In a treeless region it is advisable to have three bamboo poles, each 3 metres long, jointed in two places like a fish rod.

The butt of each should be provided with a pointed steel rod 3 centimetres long and 4 millimetres in diameter.

When the tent is to be pitched these poles are brought together and tied in the form of a tripod, the tent being lung from the point.

together and tied in the form of a tripod, the tent being hung from the point.

The tent (Fig. 1) is made of nine equal segments of Pequit unbleached cotton sheeting, which is to be shrunk before being used. How to cut the segments with least waste is shown in Fig. 2; A B C D is one segment. All the figures were drawn to scale, but in making the phothe figures were drawn to scale, but in making the photo-lithographs care enough was not taken, therefore all the important measurements will be given. Each segment is to be out out 10 contimetres wide at the top, Fig. 1, A to B, and 94 contimetres wide at the bottom, Fig. 1, C to D. The length is 40 centimetres. As 2 centimetres are in all cases allowed for seams and hems, all these dimensions in the finished tent are reduced 4 centimetres.

To form the doorway one seam remains unsewed for a distance of 130 centimetres from the lower edge of the tent.

tent.

Over this opening is sewed the weather-flap, Fig. 1,
D.G. This is of the same material as the remainder of
the tent. It is 1 metre wide and 160 centimetres long,
after being sewed to the tent and hemmed at the bottom.
Sew it on 140 centimetres from the lower edge of the

new Arm. It is a metre wide and 160 centimetres long, after being sewed to the tent and hemmed at the bottom. Sew it on 140 centimetres from the lower edge of the tent.

This weather-flap is placed in front of the always-open door as a protection from rain and sun.

It is stretched over a horizontal pole supported by the forked stakes, as shown in Fig. 1.

It extends to within a few centimetres of the ground, and is held to the upright forked stakes by pieces of tape 10 centimetres long, sewed to each lower corner.

Fig. 6 shows the inside of the tent at the doorway. The observer is supposed to be in the tent and looking out. The dotted lines represent the sides of the doorway, turnet back outside. Over the triangular space thus left is a piece of fine muslin, too close for midges to get through. This is represented in diagram by the crossed lines. It is made strong by a binding of cotton cloth, 2 centimetres wide. This binding is sewed to the tent along the upper and left hand edges (Fig. 6, D. E. F.). The bottom and right hand edge are free, the latter being provided with stud-holes, through which pass brass shirtstuds, the heads of which are seen in Fig. 6, at A. A., A., A. When in use the muslin door is buttoned between two narrow bands of cloth, sewed to the tent at the right hand side of the doorway. In Fig. 6 the inner of these folds is, for a short distance from the bottom, turned back to show how the muslin door is buttoned.

The tent is fastened to the ground by steel pins, passing through loops sewed to the tent.

These are shown at J. J., J., Fig. 1, and the loops more plainly in Fig. 4.

The loops are ten in number, made by doubling pieces of linen tape, 3 centimetres broad and 28 centimetres long.

plainly in Fig. 4.

The loops are ten in number, made by doubling pieces of linen tape, 3 centimetres broad and 28 centimetres

The loops are ten in number, made by doubling pieces of linen tape, 3 centimetres broad and 28 centimetres long.

A loop is to be sewed to each of the eight closed seams of the tent. The other two are to be sewed, one on each side of the open seam forming the doorway. Sew each one on with a double row of stitches, beginning 10 centimetres from the bottom of the tent and extending upeach side the tent seams for 10 centimetres.

The object of sewing on the loops 10 centimetres from the bottom is that when the tent is pitched, the bottom for 10 centimetres is turned in and lies flat upon the ground; so that by covering this with fir boughs or moss there can be no open space between the tent and ground for insects or reptiles to enter through.

Fig. 1, K, K, K, represents strips of linen tape 20 centimetres long and 2 centimetres wide. To each of the nine seams in the tent body sew one of these strips.

The sewing should begin 3 centimetres below the top of the tent body, and extend as a double row of stitches down each side of each scam for a distance of 8 centimetres. Three centimetres are left unsewed at the top, because the muslin cap, yet to be described, is tucked in between the linen strips and the top of the tent body. The upper ends of these nine strips are looped over the ring, shown in Fig. 5, and sewed. Through the hole in the center of the bar bisecting the ring (Fig. 5) passes the suspension cord (Fig. 1, B). The ring is 5 centimetres in diameter.

It is made of brass wire, 4 millimetres in diameter.

Only the case (Fig. 1, C) nowyrequire description.

ameter.

It is made of brass wire, 4 millimetres in diameter.
Only the caps (Fig. 1, C) now require description.
There are two of these, though only the outer one is shown in the drawing.
This is of cotton, like the tent body.
The inner one is

of muslin, like the door.

The dimensions are the same. They are cones, 30 centimetres high, with a diameter at the base of 24 centimetres.
The apex is perforated for the passage of a suspending cord (Fig. 1, 1).
Fig. 1, A, represents a disc of rubber 4 contimetres in

diameter, which fitting to the suspending cord prevents water from entering the tent at the apex.

The outside cap is turned up as in the figure, answering two purposes:—First, to prevent rain from entering; second, to create a draft by deflecting the wind. The inside or muslin cap is tucked under the upper edge of the tent-body, between it and the suspending strips, K K K, Fig. 1, serving in connection with the muslin door as a perfect protection against insects, yet allowing of good ventilation. As these are the important features good ventilation. As these are the important features the tent, attention is called to them.

of the tent, attention is called to them.

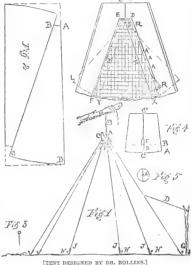

The tent pins, Fig. 3, are pointed rods of steel, heavily coated with zinc. They are ten in number. Length, 25 centimentres; diameter, 4 millimetres.

Two of these are permanently fastened together by being tied one at each end of a piece of linen cord, which when drawn straight accounts a training heavily. being tied one at each end of a piece of linear cord, which when drawn straight separates the pins by addistance equal to one-half the diameter of the base of the tent when pitched.

Two others are fastened in the same way, the distance between them being equal to the distance between the loops J J. Fig. 1.

After the tent is made, before sewing on the neglection of the fallows
Atter the tent is made, before sewing on the musin door and adjusting the muslin cap, dip it into the following fluid to render it waterproof: Naphtha, 8 litres; paraffine wax, 1 kilogramme; cosmoline, 50 grammes. Dissolve the paraffine and cosmoline in the naphtha by heating to about 37 centigrade.

As a considerable time is required for solution, keep the mixture in a large bottle until ready for use; then pour

ITENT DESIGNED BY DR. ROLLINS.]

into a proper vessel, and dip the tent into it. After removing wring out the fluid, hanging up the tent in the sun, or if in winter, iron in the mixture with a sad-iron, after the naphtha has evaporated. If desirable, dip the tent again: the amount of fluid given will allow of this. After sewing on the muslin door and adjusting the muslin cap, the tent will be complete.

To pitch the tent:—Push one of the tent pins into the ground in the centre of the spot chosen for the tent, then with the other, which is attached by the cord, mark a circle on the ground. If the pins are fastened at a proper distance, the circle will have the same diameter as the base of the tent.

Now with the other two pins, which were fastened by the shorter cord, mark on the circle the points where the tent pins are to go. Then pass a pin through a loop and push it into the ground. Do this with the remaining pine pins and nine loops. Now by pulling on the suspending cord, which has been thrown over a branch, the tent will rise into form. After fastening the cord, turn in the lower edge of the tent ten centimetres, laying it flat upon the ground. The object of this, as mentioned before, is to make the junction with the ground as tight as possible, to prevent reptiles and insects from entering.

After placing the weather flap, Fig. 1, B, in position, the tent is ready.

Before going to bed, cut a piece of thick bark, making a smudge on it. Place in the tent; closs the cotton door; after a minute draw down the cap. After five minutes take out the snudge, throw back the cotton door, and when a down and tuck in the muslin cap. Enter the tent before all the smoke has escaped, adjust the weather flap, button the muslin door, crawl into a blanket.

WILLIAM HERBERT ROLLINS.

Boston, Dec. 20th, 1879.

A TEMPORARY SHAYTY.—Toronto, Feb. 2d.—Select two trees, ten feet apart. Between them and at a height of eight feet nail a three-inch pole to form a ridge, and then on either side slope light poles, driving one end into the ground and nailing the other to the ridge-pole at a spread of eight feet. Cover these with pine or cedar bark, which is easily procurable off dead or fallen trees, taking care to lap the edges of the bark so as to throw off water. A light coat of pine tops and a second layer of bark will give additional security. Bind the whole with light sapings. The ends can be made by driving in small uprights and weaving between them pine tops, leaving at one end an opening to serve as a door. The above may not have much "solid comfort," but it will answer the purpose, can be run up in a few hours, and is no loss to leave behind,

BASS FISHING AT CHARLESTON LAKE

NEW YORK, Feb. 6th.

New York, Feb, 6th.

I wish to introduce to the lovers of fly-fishing a lake which has never to my knowledge been mentioned in the columns of Forestan NTFREAM. It is in the Province of Ontario, Canada, and about as sectuded from civilization as any sportsman could desire. Charleston Lake, the body of water I speak of, may be reached in two ways. One by going from New York to Clayton, St. Lawrence County, N. Y., and rowing up the Gananoque River from the town of that name through the "Drowned Lands." This necessitates two carries and a thirty-mile row before reaching the lake. A second and easier way, though far less agreeable to a lover of scenic effect and the woods in all their wildness, is to go to the small village of Rockport, on the Canada side of the to go of the small village of the exports of the catalogues of the St. Lawrence, about opposite Alexan'ria Bay, and drive from there to the foot of the lake, twenty miles. He who does not care for bass fishing need not go. That is the only fish the lake contains, if I except some few pickerel and numerous lake trout which can easely some low packets and macrous and one which can only be caught by trolling with heavy sinkers, one to two bunderd feet below the surface—a modus operandi which most fishermen will concur in pronouncing with me no sport. But for boxs Charleston Lake is the place par accellence. Should you be a novice at easting you may troll with a heavy rod and a gang of thes and have sport enough. Leave all your fancy flies

gang of tiles and have sport enough. Leave all your fancy fies at home and use a large red or white fly, as these will take nine-tenths of ail the fish caught.

But to the expert who can cast well his fly it is simply perfection. What a sensation it is! You stand up in your boat awalting a favorable place to east. Your boatman pulls slowly and evenly around a rooky shoal. One skillful turn of the wrist, your line liles out, and seemingly before your fly has touched the water there is a rush, a flash, and your nerves tingle with the shock on your seven-ounce red as your line whizze from the red. Gradually the rush ceases and you commence to reed in. Now is the time to bring all your skill into play—a single slip, a slackening of the line, and your fish is gone. Slowly you bring him along, and nearer and nearer heapproaches the net which your boatman keeps in readiness by his side; but he sees the boat, and with recps in readiness by his side; but he sees the boat, and with recps in readiness by his side; but he sees the boat, and with reand nearer and nearer heapproaches the net which your boatman keeps in readiness by his side; but he sees the boat, and withrenewed strength is off again. You were taken by surprise. Your line stackens a little, and your fish jumping from the water shakes the hook from his mouth and is lost. You are disappointed now, but botter luck next time. Another base is hooked; but to your surprise be comes in without a struggle. Faugh! It is a rocksurprise he comes in without in struggit. Faught it is a rock-bass, and you throw him away, recognizing one of the evils of the sport. But now you have better luck, and after another strug-gle your fish lies gasping in the net, a perfect type of a gamy bass cold and block like the water he has just involuntarily left. Such is the sport as I found it at Charleston Luke; and as this

Such is the sport as a found it as Chiteston Lake; and as his like is not well known either to Americans or Chandlans, the base are in great numbers. A one-pound black base here will give as much sport and show as much sight as a fish of two bis weight in the St. Lawrence. Another peculiarity of these fish is the fact, verified by personal experience, that the basis in this lake seems to verified by personal experience, that the bass in this lake seems to go on and off the shoals periodically; so It happens sometimes that one may have good fishing one week and poor the next. On our last trip to this place the fish did not rise well to a cast; they were on the shoals, and most of those taken were caught by those who trolled with a long line. Ordinarily, however, when you find them on the rocky shoals and on the edge of weed-beds they will

who trolled with a long line. Ordinarily, however, when you find them on the rocky shoals and on the edge of weed-beds they will rise well; later in the season they seek the deep water when it is almost impossible to take them.

If my of the readers of this journal have a week to spare let them go up to this lake in July for the best fishing, and in September for the best shooting and fishing combined. The 'Drowned Lands' through which they will pass they will find black with ducks, and the grouse around the lake are very plentiful, though hard to get at. A congenial party prepared to rough it need not fear any lack of fun. You can stay at the hotel (2) thy courtesty for §6 each per week, or you can camp out either on the main land or on some one of the numerous islands. In neither place will you be bothered with flies or mosquitos. Our party averaged last season twenty-five bias a day per boat, not counting the fish under three-quarters of a pound, and fishing only in the early mornings and afternoons.

If any party would like to try their luck at Charleston next summer my advise would be to go direct to Layton by the New York Central Bailroad, and hiring men with their boats on the river to row up the Gamanoque River to the lake, and camp out. All the boatmen are good cooks and can make a camp with any-

Fiver to row up the cambinopine faver to the lake, and camp out. All the boatmen are good cooks and can make a namp with any-body. No one who takes this trip will ever regret it. The fine seenery, the good fishing, and the pleasure of camping out, all tend to make a vistt pay better than most places. As far as I know, but two other parties besides ours ever visit the lake, and this is in itself a recommendation. About the shooting one must this is in itself a recommensurion.

Another than the Custom-House on entering Canada a sufficient sum to eover the duty, which money he will receive back on learing Canadian territory. This is a rule applying to line-arms of all descriptions. I cannot speak from personal experience about the fall shooting, but while at the lack during the month of July we saw many grouse and even some fow ducks. From the appearance of the country and the abundance of wild rice and food of all lining, it must bo as the guides declare—a fine place for ducks. At any rate, the fishing will well repay any parties who may perchance wish to make a nice trip irrespective of roughing it.

W, D.

NEW PUBLICATIONS.

THE NUTTALL BULLETIN.-The opening number of volume five THE NUTLAL BULLETIN-THE opening number of volume five of the Bulletin of the Nutlatil Ornithological Club comes to us on the 1st of January with very attractive contents, and we welcome it as warmly as ever. It would be difficult for any one who has notwatched with care the rapidity with which the love for that has not watched with care the rapidity with which the love for that delightful science, of which the Bulletin is the recognized representative in this country, has spread among the people, to appreciate how great a work this publication has done for science during its short life. The constantly increasing number of ornithologists throughout the length and breadth of the land, and the vastly improved character of the work which they do, bear with the constantly increased these sections. to its usefulness.

vasty improved transcendences with a delightful article by Mr. Brewster, on the Habits and Distribution of the Philadelphia Virco (Virco philadelphiaus), which is followed by a most interesting sketch by Mr. Bicknell, entitled Renarks on the Nidification ing section by sin. includes, control actualizes to the Automotive of Loxic Curvivostra Americana, with a Description of Its Next and Eggs. Our frequent correspondents, Mesers. T. S. Roberts and F. Benner, present a Contribution to the Grunthood poly of Minnesotn, in the shape of a list of oighty-six species of birds observed in the counties of Grant and Travorso of that State. Among the birds noted were three not previously reported from that State, viz.: Peterophanes ornatus, Calamospica histoire and Tymanus servicalis. Dr. Couce's paper on the Neving in Missouri of Empidonax acadicus and Empidonax traffiti is of great interest-

in this number Mr. Deane gives a number of Additional Cases of Albinism and Melanism in North American Birds, and adds thirty Addinish and sedanism in North American drive, and ados unity-nine species to these previously mentioned as sometimes albi-notic. Mr. Ridgway's two articles—the first on Six Species of Birds New to the Famu of Illinois, with Notes on other lare Illi-nois Birds, and the other on Current Objectionable Names of North American Rivis-are both very valuable and interesting; as is also Mr. Nelson's An Alternoon in the Vicinity of St. Michael's, Aluska.

Recent Literature and General Notes occupy nearly one-half of

Recent interactive and depends in the sound means on the January number of the Bulletin, and are as interesting and as full of news as they usually are.

The number as a whole is most excellent.

The Remel.

THE MONTREAL BENCH SHOW.

THE MONTREAL BENCH SHOW.

MONTREAL, Quebec, Feb. 7th,
WELL, our Show is over: and I for one, am not sorry. Neither are my dogs—to tell the truth, they were pretty sick of it. The Montreal Poultry, Dog and Fet Stock Association has been in existence for some years, and has done goed work in the encouragement of the breeding of thoroughbred stock of all kinds. The dog-men have talked for some time of separating from the parent Association, and I, for one, hope they will; for I know little about poultry and famey stock, and care less. For that reason, and because it will probably not interest your readers, I will make no mention of the poultry, etc., department, further than it was a pretty and entertaining sight to see so many beautiful fowls and pigeons, etc., and pass on to the dogs without delay. The prizes in each class were: \$2 to first, \$1 to second.

As you cuter the building 'you find yourself among the setters, pointers, greyhounds, etc. These classes were very poorly filled, both as to quantity and quality, with a few notable exceptions, however. The rough deerhound og was a beauty of the true type. He was the only one exhibited.

A magnificent white greyhound dog, owned by Mr.

new notance exceptions, nowerer. The rough deerhound dog was a beauty of the true type. He was the only one exhibited.

A magnificent white greyhound dog, owned by Mr. Harry C. Gibbs, of Ottawa, though exhibited by J. Lindson, and with his spotless snow-white coat and exquisite symmetry, attracted a great deal of attention. The two bitches exhibited were fair.

Pointers were poor, as a class. First and second were fine, large, well-built dogs; the rest. I did not much fancy. English sotters were very good, indeed. Notably, the first-prize dog, a big orange and white. Irish setters, first and second, were very good; the other two exhibited were mongrels—more like St. Bernards than setters. Two Gordon setters, exhibited by Dr. Niven, were simply grand, especially Blossom. The other arrived after the judging, so was not placed. One good Irish water spaniel and a pair of fox-hounds completes that flat. Below were the mastiffs and St. Bernards, all splendid—three beautiful chumbers, four buildogs, and the Newfoundlands. The first Newfoundland dog was a beauty; his head was simply perfect, and he was ably seconded by the second-prize dog, who was a trife larger but with a coarser head. There was a third dog that I admired, naking a trio hard to beat, or to equal either. The rest, dogs and bitches, were poor. There was a bear on this lat, and I believe one of the buildogs broke loose and had to be carried home in pieces after his interview with Master Ursus.

Among the smaller dogs, two beautiful spitz are first to be seen. Then a long row of fox-terriers. The first

bitches, were poin. There was a bear on this lat, and I believe one of the bulldogs broke loose and had to be carried home in pieces after his interview with Master Ursus.

Among the smaller dogs, two beautiful spitz are first to be seen. Then a long row of fox-terriers. The first prize dog was a nice chunky little fellow with faulty cars, however. There were about thirty dogs and bitches in this class, and all good ones. At this stage you pass a fine Norfolk spaniel, who should be down stairs, and come to the bull-terriers, large and small. These are all good, particularly the small ones.

Then came the cockers, four dogs and eight or nine bitches. First dog a perfect little beauty, liver colored, about twenty or twenty-five pounds; the has no pedigree unfortunately, but is still a valuable dog; his owner refused to part with him at any price. Second dog, black and white, a late importation, very lair; nest very poor. First bitch, Cora, is a beauty, the very image of the first pize dog—in fact Mr. Cunningham mistook her for his dog on entering the show. Second prize bitch Madean, a very pretty black bitch, eighteen pounds. Flirt, full sister to Cora, and a good bitch was unnoticed. These three are the property of the writer and are only nine mathematically. A pretty black and white betch, mate to the second dog, was also unnoticed. Colleys were a grand class all the way through; not a bad dog in the bot. A pretty King Charles, four beautiful Blenheims (one with a litter of puppies a family of rough fox terriers, numberless beautiful Siyes and Yorkies, notably the prize dogs, and a few good toy terriers complete the list. There were also some good Italian greyhounds.

The thanks of all the exhibitors are double for the prize dogs, and a few good toy terriers complete the list. There were also some good trailing the most of the prize that is a full to the prizes:—

Entries For the Derny Stakes.—New York, Feb. 6th.

ENTERES FOR THE DERBY STAKES.—New York, Feb. 6th.—Having weighed the evidence laid before me in the matter of the eligibility of puppies for the Derby Stakes of the National American Kennel Club in 1889, I decide that the first day of April, 1870, is the limit of birth for entries of puppies in that State, as established by the club at its meeting in Patoka, Ill., in 1879.

CHARLES H. RAYMOND, President.

SQUIRREL DOG.—Missouri Valley, Iowa, Feb. 5th.—I have seen several letters in your paper relating to "Best Dog on Squirrels." At my home in Pennsylvania squirrels are very plentiful, and in the last ten years I have killed a great many with the aid of my "full blooded yellow cur," and a better and truer dog for the above game I have yet to hunt over. In the fall, when they are cutting nuts, it is best to hunt without a dog, but at that time of the year when they are on the ground in search of food, a little dog is what you want. My little fellow, after finding the track, follows them to the tree and begins a sharp barking. Should the squirrel jump from one tree to another the dog will follow, and is sure to tell you where the game is upon your arrival. Quite frequently they stop on the first or second branch and begin to bark at the dog as "C. II. A." tells of. In this Western country you will find the large fox squirrel. They are very plenty, and a bag of thirty is nothing uncommon for a day's sport. I was down to the Missouri River last week and saw lots of geese. We also have lots of quail, chickens and turkeys.

Freuer Allin's Blue Dogs.—Rockville, Conn.. Feb.

saw lots of geese. We also have lots of quail, chickens and turkeys.

ETHAN ALLIN'S BLUE DOGS.—Rockville, Conn., Feb. 9th.—In your issue of Feb. 5th I saw an article on "Ethan Allin's Blue Dogs." I had the pleasure of seeing Mr. Allin's blue Dogs." I had the pleasure of seeing Mr. Allin's blue dog Fag, in the field last fall and thought one or two incidents of that day's sport would be of interest to some of your readers. There were five guns in the party, with three dogs. We were hunting a swamp for ruffed grouse, started a flock of seven birds, bagged two: the balance scattered in all directions. As I had never seen Allin's dogs work I decided to follow the fortunes of Fag, calling my dog to heel. Very soon we saw Fag drawing on very slowly and carefully for thirty or forty yards and make his point. Mr. Allin walked up and tried to urge him on, but without success. He would take Fag by the tail and spin him round and round, but the dog was paralyzed—had lost all power of motion. As it was high twelve we called our companions to refreshment, leaving Fag with the bird. After dinner we lit our dudheens, and chatted for a while, when one of my companions walked up the bird and killed it, thus reflexing poor Fag. Just at dusk, as we were walking down the road, on our return home, we missed Fag, and looking back, saw him two hundred yards away in the center of the road, pointing. One of our party said, "We have just passed there with all our dogs; I guess Fag is point. At his suggestion we returned and ranged ourselves in the rear of Fag. My dog was sent in to put up the birds we noticed Fag still holding bis point. Mr. Allin said, "There must be more birds laying close in the bogs." So we walked in, drove out and killed two more.

Las L.

An Intelligent Dog.—Sardis, Miss., Jan. 31st.—The following was told me (and told for the truth) by a friend: Some time ago there was an old one-eyed pointer named Jake, who, like the average tramp, took his meals where he could get them, but, unlike the tramp, he would stay with the last man that fed him until invited away. On a cold and sleety evening old Jake made a call on one of our sportsmen, and spent the aftermoon very comfortably lying by the tire. When it grow time to go to supper old Jake was invited out, but refused to go, and as the gentleman has a big heart (like all true sportsmen), he concluded to let Mr. Pointer remain, and bring his supper to him. He did this, and allowed the old fellow to remain until bed-time, when he was driven out, and the door thumb-bolted from the inside. Our friend retired, and was soon lost in slumbers. How long he slept he the door thumb-bolted from the inside. Our friend retired, and was soon lost in slumbers. How long he slept he does not state, but some time during the night he was aroused to his senses by a cold wind blowing in on him. He looked and saw the door ajar. His first thought was: "Somebody's broken in on me," but he couldn't imagine what any person could find in his office (law) they would have. Hearing a slight noise at the fire, he looked, and there sat old Jake. The fire had nearly died out; still a few "chunks" remained, and old Jake, after having opened the door and come in, was putting the chunks together with his paws, and actually blowing the dying embers to infuse new life into them. That was more than our friend could stand. He got out of bed, made old Jake a pallet near the fire, put on more wood, closed the door, and let the sagacious canine remain over night.

W. H. C.

Jake a pallet near the fire, put on more wood, closed the door, and let the sagacious canine remain over night.

Shooting Dogs.—Piermont on Hudson, Jan. 26th.—
The writer has used cold lead in breaking wild dogs, but cannot call to mind an instance where it ever did any good. Some years ago I was presented by Dr. A. R.
Strachan, with a pointer puppy, by George out of Peg; he proved to be the most intelligent dog I ever saw. In

the fall of 1872 I shot over him in Ohio. Though generally very obedient, one day he worked too far off; would not mind the whistle; so I gave him a charge of No. 8 shot, some half-dozen pellets of which struck him; he came back immediately; I scolded him and told him to hie on, when he did the same thing over again. I did not want to shoot him again, but promised him a good thrashing when I did carch him, which I soon had a chance to do, as after going some hundred and fifty yards he came to a point on a bery of quail; since that time I have never shot at a dog and never shall. At one time I had a very promising young setter; he used to go to one of the neighbors to play with his young dog. The man thought the best way to drive mine home was to sting him with shot, so the dog came back with one eye out. Another case; a friend of mine had a splendid young pointer; he would not mind, so at about forty yards he gave him a charge of No. 8s, with four drachms of powder behind it. The dog droped dead—he hardly kicked; so much for training dogs with cold lead. Kicking a dog is about as bad. Perhaps the best field dog I ever saw was lamed for over a year by a kick from his britte of a master; the kick was altogether uncalled for, but the brute (I mean the master, not the along was drunk. No man will own many first-class dogs in a lifetime, so we cannot be too careful of them. An old Scotch friend of mine had an old pointer which lived to be sixteen years of age before he died. The old man would cry when talking about him, and say if he had taken better care of the dog when he was young he night have lasted a year or two longer, but as it was now, his shooting days were over. He joined the dog in the happy hunting grounds about four years after. Gentlemen, take good care of your dogs, or you may, like my old friend, look back and regret you did not use them well, though his dog was used better than most dogs.

WHOSE DOG IS THIS ?—Paule's Cross-Roads, Spottsylvania Co., Va., Feb. 4th.—If the young Englishman who got to bucking at peach and honey and mountain apple-jack, some time since, at Charlottesville, Va., and let those articles beat and get away with him, and took the cars when "All-a-board!" was sounded, leaving his young imported Ferlish cocker spaniel claimed to a settee in the imported English cocker spaniel chained to a settee in the imported Engissi occker spanied chained to a settee in the gentleman streepflon noom—which dog was subsequently stolen by a negro—will write to the undersigned, he without charge of any sort, in restoring so good and valuable a dog to his rightful owner.

R. M. Coxway.

IMPORTED IRISH PUPPLES.—A very promising brace of red Irish setter pupples arrived here a short time ago, consigned to Dr. S. Fleet Speir, of Brooklyn, N. Y., and reshipped by that geatleman to their purchaser, Dr. J. W. Downey, of New Market, Frederick County, Md. The pupples were by champino Count, out of Maybe (the latter the dam of so many winners), from the well-known kennel of Mr. Æbneas Falkher Nuttall, Tiltour, Newtown Mount Kennedy, County Wicklow, Ireland. Dr. Downey deserves great credit for his liberal efforts in perfecting the breed of Irish setters, which will be rewarded by his putting in the field dogs that will be hard to beat.

IMPORTED STOCK.—The steamer City of Chester of the IMPORTED STOCK.—The steamer City of Chester of the Imma Line, which arrived here on Sunday last, had on board a very promising pair of setter puppies from th kenuel of Mr. A. F. Grant, Derum Villa, Newport, Engeland, for Mr. J. H. Dew, of Columbia, Tenn. The puppies were consigned to Mr. E. B. Goldsmith, of 58 Walt street, the well-known forwarding agent, who kindly sent us word of the arrival of the foreigners; we found the puppies in excellent condition, but from the dark quarters in which they were stowed, to be out of the way in the unloading of the ship's freight, we were unable to have as good a look at them as we wisled. In our next issue we will endavor to give full particulars about them,

MR. H. W. LIVINGSTON'S KENNEL.—Mr. Henry W. Livingston, of this city, is about organizing a kennel for sporting dogs at Flushing, Queens County, Long Island, having engaged the services of Mr. William W. Titus, a competent trainer and kennel-man, who has, with his brother, managed a breaking kennel at Centreport, Long Island, and has given good satisfaction to many gentlemen of this vicinity who have placed dogs in his charge. The quarters for dogs consist of one large and several small buildings, with ample grounds and plenty of sunlight, shade and air. The grounds and plenty of sundergo the necessary alterations to convert them into a complete kennel. In a future issue we will give our readers a description of the canine inmates of the establishment. MR. H. W. LIVINGSTON'S KENNEL,-Mr. Henry W. Liv-

ment.

NAMES CLAIMED—Random and Rhoad,—Mr. Edmund Orgill, of Brooklyn, N. Y., claims the names of Random for lemon and white dog, and Rhoad for lemon and white birth pups, by champion Snapshot out of champion Rose, whelped June 17th, 1879.

Riot and Romp II.—Mr. Edmund Orgill claims the names of Riot for lemon and white dog, and Romp II for lemon and white birth pups, by champion Rush out of champion Romp, whelped June 18th, 1879.

Rowell and Rue.—Mr. Edmund Orgill claims the names of Rowell for lemon and white dog, and Rue for lemon and white birth pups, by champion Rush out of champion Rushy, whelped June 18th, 1879.

Rowell and Rue.—Mr. Edmund Orgill claims the names of Rowell for lemon and white dog, and Rue for lemon and white birth pups, by champion Snapshot out of champion Rushy, whelped August 12th, 1879.

Roper.—Mr. H. Herz, of Pittsburg, Penn., claims the name of Roper for his liver colored setter dog, out of Mr. J. W. Gillespie's imported birth Rosa, by Karl; whelped March 23d, 1879.

Tom.—Mr. Eph. Allen, of this city, claims the name of Tom for his red setter, out of Mr. George Hode's birth Dutchess II, by Mr. Chas, Sheppard's dog Roy. (Shipman's Tom, Governeur's Bitz Liza). Tom is fifteen months old and well broken.

WHELES.—Cosette.—Mr. Robert Long's (Boston, Mass.)

SALES—Beulth and Rose II.—Mr. A. H. Mcore, of Philadelphia, has purchased frem Mr. Edmund Orgill, his pointers, Beulah and Rose II.

Mr. J. J. Jordan, Winchester, Virginia, has purchased from Mr. Henry W. Livingston, New York, the white and lemon pointer pup Consul, whelped November 24th, 1879, by Orgill's champion Rush (Falke-Lillie), out of Livingston's Rose (champion Snapshot Gypsy).

Wricket.

SOMETHING ABOUT CRICKET GROUNDS.

POR a good roomy ground, inclose four acres, and make it from and to end as level as possible. For good wear and for classicity, let it be a soil of black earth mixed with leamy clay, so that if the position lies low it will allow the water to run off, yet leaving it just hard enough for the hall to play from the pitch without digeting or cutting, for if the ball cuts the ground in its pitch, before reaching the wicket, the datasman will be builled, and have difficulty in playing it properly, or in some cases balledy and make the many down are properly, or assume asset balledy fig. It all. Thus it is may down at so much from its true playing if at all. Thus it is may down as the season and the first the course of a fine hit or a correct bitlof play, all of which is very likely in an or the result of the player that he may lose his proper battle. By m, and return with a round 0, or a very small [seen, as the case the case of the player that the may lose the player that the may lose the player that the may lose his proper battle. may be

In the first formation or making of a cricket ground especial In the first formation or making of a cricket ground espocal careshould be taken to have the match wickets or centre part of the ground as level as possible, and when made, another important item is never to be lost sight of, that is, the running between the whekets—run lightly, and away from the pitch, so as not to make the slightest undentation, scratch or slide in trying to turn in a hurry, for if you do so—which is too often the case—the whole labor of a day or two in preparing the wicket is thrown away, and the picasure of the play or natch is most assuredly lost past recovery. If you would see a cricketer in his best spirits and in his sweetest temper, show him, when he comes on the ground, a true, level wicket, without holes or bills, and you will and cannot help axing. What a nice, good-tempered fellow that man is, to be sure." and he will, in eight cases out of ten, play well, and show you good form.

It has fallen to my lot to see such, a good wicket that good bowlers glook their heads, and said: "It will be pretty hard to get Mr. Laue out on this wicket, and those that will have a good time to-day will be the side that wins the toss, and go to the but first." Well, on that wicket the bowler's remarks proved cothe wickets-run lightly, and away from the pitch, so as not to

Well, on that wicket the bowler's remarks proved correet, and I witnessed one of the best and most exciting matches root, and I witnessed one of the best and most exciting matches I ever saw. It was "England vs. Surrey," in 1890. Surrey was a that time in her best and strongest form, and a common saying on the oral where this match gwas played at that time was "Surrey against the world!" Her supporters were not disappointed, for Surrey won the match, but by just how many runs I do not remember. Mr. Lane, I do know, made 2 and 55 not out and was presented with a new but tor each funings score. This was not the only victory obtained by Surrey over England, for in 1868 Surrey defeated England by one innings, the scores being—for England 2 and 15 an for England, 62 and 154, against Surrey's 224 in first innings. Billy Caffyn in that match hit off an excellent 102, and H. H. Steven. Caffyn in that match hit off an excellent 102, and H. H. Stevenson clean bowling twelve of England's wickets; and England at that time was very strong, for it included such well-known names as G. Parr, G. Anderson, J. Jackson, G. Tarrant, T. Hayward, R. Carpenter, Tinley, Clark and Willsher; and for Surrey, P. P. Miller as captain, with C. J. Lane, F. Burbidge, Mr. Dowson, H. H. Stevenson, W. Cattyn, W. Mortlock, G. Grillith, J. Casar, T. Lockyer and Tom Sewell—the finest team Surrey ever put in the field, and very rarely lost a match, their fielding being as near perfection as possible, for Mortlock's long-stopping and Lock-ver's wicket-known by were used to see. In Ivan successive series yer's wicket-keeping were a treat to see. In two successive sea sous Mortlock long-stopped to 1,200 balls, from which only three

byes were scored.
In the match Surrey vs. Yorkshire, in 1802, Callyn's bowling was useful, as will be seen from this match, as a sample. When both limings for Surrey had been played Yorkshire wanted 80-runs to win; Callyn and Tom Sewell, Jr., bowled; four of the Yorkshiremen were out for 8 runs; their fifth wicket went with the score at \$2, the sixth at 25, their seventh and eighth at 28, and their minth and tenth at 11. Thus Surrey won by 35 runs. The bowling was as follows :-

Overs. Maidens. Runs. Wides. Wickets. Tyn..... m Sewell, Jr.... 14 12

some two miles in extent—were covered with water. It came on a hard frost, and Mr. J. Mour, who was then captain of the Chert-sey Cricket Club, suggested; match on the ico. It was gotten up, and was an entire success. The big hit that realized 23 runs was made in that match.

Some may say, "Do good wickets always realize long scores? some may say, "Do good wherefs always results dong scores?" My answer is, "Not always; "but I would add that on good, true grounds or lovel weikefs the chances are fen to one in favor of the batsman, for if he is but an ordinary player the confidence he will feel will bring out his best qualities, and show a form that would be simply impossible on a bad whicket. He takes confidence he would be simply with a little caution to stat where, the takes connadence whimself, and with a little caution to stop or play the good ones, and his play, and and tree at loose ones, is finally settles down to his play, and to the surprise of influence expert players, runsup a good sore, for when he at lest retires he has a good double figure at the ord of his aname, which whus the match for his side,

figure at the end of his name, which wins the match for his side, and makes him for that day, at least, the here of the hour. Thus It will be seen that a good wicket is everything to a cricketer.

To obtain this correct and true wicket, a great deal of time, patience, and constant blue's incessary. Taking it for granted, that you have made your ground properly, and obtained a good goneral level, you will have to watch very closely to see if any one or more places should drop or sink. Should this prove to be the case, immediately take off the sold lay! to no one slide, and bring some good line soil and fill it level with the rest; then replace the sods and quietly beat or press them, not too much, and you will soon see the turf all allited and herfedty smooth. When you have sods and quietly beat or press them, not too much, and you will soon see the turf all alike and perfectly smooth. When you have soon see the turr an antice and perfectly smooth. When you have made the sooks meet, and they fully touch into each other, if you have not jointed them well, sow in the cracks a little grass seed, and in a short time it will grow and unite with the other grass, and all become strong together. When the grass has grown, say from one inch to one inch and it huld, not longer, it must be cut with a good mower, and then well-rolled; but not overdone

to kill the cross, and so from time to time continued, until the sod is thick and strong like a good strong carpet; then the will play from it without leaving a mark or indentation, wicket is a good one and ready for play, the like of which an he seen on all the first-class grounds in England, and or can be seen of an tree inst-cases grounds in England, and on which invariably long scores are made. I am sure that if such a ground was made in this country, and kept solely for circket, our Young America boys would then make long scores, which would favorably compare with those of the amateurs on the other side; and I would warrant my existence that it two sca-

other sact and a wond warrant my existence that in two sca-sons I could got such a wicket.

What are very much neglected on the grounds about here are the worm bills that are constantly made, and require much atten-tion. If they are neglected, they will ruin any ground; cause it to look and become knotity, and make it so uneven that it would be simply impossible for the bull to play true. This I ke would be simply impossible for the ball to pay frue. This I know has been ignored by the professionals about here, simply because it entails on them a little extra work. Much of the pleasure of the match at Staten Island, with the English Eleven, was marred on that account. I am now speaking of the fielding alone and not on that recount. I am now speaking of the incoming among and it the welckt, which was a very good one. Those that saw it match, and wondered to see even the "crack" Englishmen mithe ball so badly when on the ground, did not know that, it though the field looked so nicely and prettify at a distance. was full of worm hills and knobs from end to end, and just made It a matter of chance whether you took the ball in your hand o It a matter or chance whether you took the ball in your hand or the struck some part of your body. All players, who understand anything of ground-work, know that what I say is true. A simple-cheap, and offectual remedy for the above, is what English ground-men call the bush-harrow, which is made of blackthorn bushes, platted in and our of a frame made for the purpose, which is simply pacted mand on a training name for no purpose, when is simply a few narrow strips of boards nailed together, with a piece of cord fied to two of the ends. Drag this over the ground just as soon as the worm hills are a little dry, which does not take long if the sun has been shining an bour or two. A large piece of ground can be gone over, backward and forward, in about one hour and a halfgone over, backward and forward, in about one hour and a half-and the benefit derived is very great, for it not only levels the hills, but it spreads the nice tine soil and feeds the young grass which benefits and repays you for your little trouble. I have never yet seen anything of this kind used by any ground-keepers since I have been in this country. The result has, therefore, been very few good wickets, and bad out-fielding. When I found I could not obtain blackthorn bushes here in New York, I made a plain, simple frame of strips of wood about four feet square, and have used it on the St. George's ground ever since I first came to them in the fall of ISE. I mewers the nurses admirably, and them in the fall of 1874. It answers the purpose admirably, and I don't wish for suything better; neither do I mean to apply tursout was to any timing better; neutier of a mean to apply for a "patent," nor wish to reserve any rights for so valuable and in-dispensable an article on the cricket field. Moreover, I will bind myself to stand a bottle of the best champagne to the first profes-sional, outside of the St. George's grounds, that will make on and use it, for the good of cricket and the salvation of noses, eyes and teeth.

treein.

t is sometimes the case that a portion of your grounds may
k a little thin or bare. If you have such a spot sow a little
ra grass seed. Timothy, with lawn seed, is the best mixture. extra grass seed. Sprinkle a little black soil over the bare spot, and it will feed the seed and help the roots of the old grass. seed and neity the roots of the one grass. The new grass will then grow strong like the old, and a little attention will give you in about two seasons a good strong sod, which will be almost like a carpet. The places where the bowlers and even the batsane make boles, wearing off the grass entirely, must be made good by make obes, wearing on the grass entirely, must be make good by putting in new-ent sold taken from some outside corner of the field, where it can be spared, having as near as possible the same shadeas the turf. Bring the solds to the holes; I ay then exactly over, so that the bare spots are covered; then with your edging. knife cut close to the sods, and down into the earth the depth or thickness of the sod you intend putting in; then take your sod of the bare place and remove the earth, taking care not to disturb what you do not want removed or you will not have a good fit. Let the hole be just the depth of the sod, and solid at the same time, with no stones about it; then take off your sod and fit it in the same way you cut it, and if you have done the work well no the same way you cut it, and if you have done the work well no one but yourself or a practical sodder would detect it. I ran sorry to say that too little attention is paid to this very interesting matter, the result being that good wickets are often lost because of the inartistic manner in which sodding is often done. To be sure, where there is much play either in matches or practice, it is more than the work of one man to keep the ground in proper re-

more than the work of one man to keep the ground in proper repair, as if involves a vast amount of care and attention, which all grounds must have or they suffer thereby, as likewise the tempers of the players. All this may cause members to become carcless in coming to their grounds for practice, or they may eventually leave the club altogether.

Thus if we ever expect to flourish in cricket on this side as in England, our first object must be to make good grounds, keep them in good order, and then teach and encourage it among the youth of America, and ere long we shall have an eleven that will do credit to New York, and play our friends on the other side a good game whenever they may us a visit, which we hope thew will good game whenever they pay us a visit, which we hope they will continue to do until we can hold our own with them, and finally be a match for them on equal terms.

GEORGE GILES.

- J. G. Knowlton, Whitesboro, N. Y.-I. Please give me directions through your paper for spaying a bileh? 2. What is the best food for young puppies? Ans. I. The operation of spaying a bitch is both inhuman, unnatural and usoless. You must apply to a veterinary surgeon. 2. The most suitable food for puppies under five months is milk; after the puppies have been weaned gradually add bread or boiled ontimed portifage.

 A. P. P. Pleasantville, Pa.-My setter has been troutded this winter by his shedding of his hair; coat looks day. The dog looks and cats well. What shall I do to cure him of this annoying trouble? Ans. Apply the following lotion: sub-act, of lead, two drachms; pure glycerine, oue and a half onnee; fine, arrica, half ounce; rain water, six ounces; rub well into the skin every other day. Let us hear result. other day. Let us hear result.
- H. It., Penn.-1. What is the healthiest food for a dog that receives but little exercise? 2. 182the Hotelskis rida a good line re-earn, and a reliable one? Ans. I Indian meal mush, with meat and vegetables mixed in it, is a good reed for dogs. Regulated quantity of meat and vegetables to condition of dog. A dog that is exercised but little should be fred sparingly twice a day. should the animal become constinuted, give him a meal of boiled liver every now and then. 2. Ves.
- E. F. G.-Duxbury Y. C. publishes no club book and we have I. F. G.—Dixmury Y. C. puntiness no cuto book and we have not the dimensions of the Strene. The best builders advertise in our columns, and you should apply to them. They can furnish any model desired. The Hermus schooner is Sift, deck, Sift. 7in, w. L., 12ft. 6in. beam, and 7ft. draft, with keel. May be considered as approaching the "medium" type. Is a serviceable and hand-some craft. Believe she was built by Watson, Plymouth, Mass, but we are not cortain. out we are not certain.
- J. F., Cincinnati.-Ice boats sail faster than the wind in all cases except when before it and when the wind is so hight as just to be able to overcome the friction on the runners and barely give the boat way. The effect of the wind is comulative and keeps adding continually to the speed until the relative direction of the wind is brought so far forward as to diminish its effect. This is the limit to the speed attainable under the circumstances. for the wind it cannot act cumulatively because the boat keeps running away from it, diminishing the wind's force every time the boat dars away at a greater speed. She must therefore drop again to a speed no greater than that of the wind.

FISH PONDS, Massachusetts.—According to the Massachusetts Laws, Ch. 384, Sect. 7 to 14, "The ripurian proprietors of any ponds, the superficial area of which is not more than twenty acres, and the superneam area of which is not more than twenty acres, and the proprietors of any pond, or parts of pond, created by ar-tificial thowage, shall have exclusive control of the fisheries exist-ing therein. The biliery of any pond, the superficial mean of which is more than twenty acres, shall be public. The Commissioners of Fisheries may lease ponds, which exceed twenty acres, for the purposes of fish cultivation, such leave not to affect any other purposes of issu cultivation, such leave not to affect any other public rights than the right of fisheries. Any pond, within the limit of twenty acres in area, bounded in part by land belonging to a town or county of Commonwealth, shall become the exclusive property of the riparian proprietors only upon the payment of a just compensation, for their rights therein to the town or State Treasurer, or County Commissioner." A. Sciele, Brooklyn, N. Y.—Saturday, Feb. 7th, Irequested Mr. Madison, gunsmith, No. 561 Fulton street, Brooklyn, to Ioad me a number of B-gadge shells with H ounce of Messus. Tatham Brothers' childed shot No. 8. I proceeded to target my hammer-less Greener, and upon counting the shot marks in the target I found in one of them 51s and in the other 493. Referring to circular dated New York, September 21st, 1877, and addressed by Tatham Brethers to "spurtsman and dealers in shot," I found that one ounce of No. 8 shot contains 399 pellots, consequently I ounce should contain 449. I thought of course that Mr. Madison had made a mistake in loading the shells and spoke to him about it. He measured out of a bag of Mr. Tatham Mr. Madison had made a mistake in leading the shells and spoke to him about it. He measured out of a bag of Mr. Tatham Brothers, marked No. 8 chilled shot, one ounce by Dixon's measure No. 1,109 scraped, and proceeded to count the pellets in my presence. He found 539 pellets, consequently 137 more pellets in each ounce than Messrs, Tatham Brothers claim. Upon examining the different pellos 1 found a considerable difference in the diameter of the same, some being larger or smaller than others, which undoubtedly accounts for the fregular pattern and bunching of the shot on the target. I counted afterward the number of pellets in one cunce, Dixon's measure, No. 1,109 of Tatham Brothers' soft shot, and found 465 pellets. Will the Messrs. Tatham pleace explaig 7 Ans. A shot! measure, vo. 1700 of Tattam Brothers solt and none 466 peliets. Will the Messrs, Tatham please explain? Ans. A short time ago Tatham & Brothers' sieves got slightly out of order; the consequence was that considerable shot, much inferior to the usual quality, was put on the market before they were aware of the fact. They now have entirely new and improved sieves Their" standard" shot will be found to count within very few pellets of what is claimed. To give greater uniformity to their shot, they take out sizes that are not exactly standard, bag them up and brand the same, except that the figure on the bag is fol-lowed or preceded by either a dot, or —, to denote that it is not exact in measurement, but still possessing the same finish and miformity, and is practically as good for all purposes but making

EDITORIAL NOTES,-We will have a heavy snow-fall next Monday, at least that is what Mr. Henry G. Vennor, of the Canadian Geological Survey, says; and when Mr. Vennor says that it will snow it generally snows. As long ago as Jan. 22d he said, and published the predic tion, that it would snow on Feb. 2d or Feb. 3d. Besides the snow storm next Monday, Mr. Vennor predicts others on March 17th and 21st,

Mr.F. A. Ober, "Fred Beverly," returns to Martinique this month to pursue his ornithological labors and to gain the necessary materials for a work on the birds of the Lesser Antilles.

A notable feat of mountain climbing has been success fully performed by three adventurous travelers, who last month ascended to the summit of Mount Chimborazo. This lofty peak of Ecuador ranks as the sixth in eleva tion of the Andes. Its snow-covered top towers 21,442 feet above the sea, and is seen two hundred miles from the coast. The ascent of this vast dome is attended with hardships and obstacles which have hitherto baffled the determined attempts of the most daring explorers. In 1802 Humboldt and his companions, after the most arduous exertion, arrived within 2,000 feet of the sum mit-a point then believed to be the highest point ever attained by man. In 1831 another attempt was made, the party then reaching an elevation of 19,695 feet. When we went to school we were taught that Chimborazo was a volcano; but the party who went up to the summit last month report that no crater exists, nor are there any evidences to be discovered to indicate that the mountain is of volcanic origin.

PACIFIC COAST LOGIC .- An esteemed California con temporary has ingenuously accounted for the salmon sickness noted by our correspondents as occurring among the dogs of the Pacific slope. The explanation of the phenomenon consists in denying its existence. Besides being eminently scientific, such an elucidation is valuable because it cures the dogs. We trust that our amiable friend may not allow its candle to burn away unseen in a dog kennel. There are very many perplexing questions which the world is waiting to have solved. If, for instance, this California logic can cope successfully with the baffling problems of the yellow fever germs and can restore the victims of that dread disease by simply denying the existonce of the scourge, surely its genius should not be thrown away to the salmon-sick dogs of Oregon.

THE UNITED STATES AT THE BERLIN EXHIBITION.

PROFESSOR Spencer F. Baird writes that the bill Providing for the representation of the United States at the coming German Fishery Exhibition, having already passed the House, bids fair to go safely through the Senate as well; and in that event the necessary preparations will be immediately entered upon for insuring such a satisfactory display of our fishing industries as the limited time will permit. That the United States is to be represented is a subject of congratulation. We have already published in detail the prospectus issued by the promoters of this enterprise, which includes: (1) aquatic animals, alive, stuffed, preserved in alcohol, or represented in pictures, casts, etc.; (2) fishing gear and implements; (3) pisciculture, hatching apparatus, models of well known breeding institutions, fish-ways, aquaria and illustrations of the development of some of the most important species, such as ovsters, salmon, etc.; (4) appliances for keeping and conveying freshly caught aquatic animals; (5) models of appliances in use for the preparation and preservation of the produce of fisheries for commercial and household purposes; (6) models of fishermen's dwellings and costumes; (7) scientific investigations regarding the stock of fish, physico-chemical researches, aquatic plants in relation to fish culture, herbaria. etc.: (8) history of implements of fishing, original or in reproduction from the oldest times downward and (9) literature, statistics of fisherics, and maps show ing geographical distribution of fish.

From this brief resume it will be seen that the Berlin Exhibition will be a gathering of all that can be useful in extending our knowledge of the present condition of the fishing industries of the world. The display there made, and the comparisons instituted, cannot fail of resulting in direct increase of knowledge and a consequent advance in the science and methods of fish culture and fish capture. We need not argue at this day concerning the commercial and industrial importance of international fairs and exhibitions, nor need we urge American fishermen to improve the opportunity at Berlin, next April, of comparing American methods with the most advanced appliances and practices of foreign nations.

DOSING DOGS.

 $I_{
m greater}^{
m T}$ is an almost universally acknowledged fact that a far greater number of our canine friends come to their death by physic than by the vicissitudes of the field and flood, or than those that pass away in a ripe old age with their heads upon the hearth rug. Right well in the present sporting decade is Macbeth's utterance obeyed "Throw physic to the dogs," though it is true in this pro gressive age the materia medica of dog-doctoring has made a grand stride, and tin filings and powdered glass have had to give way to areca nut and the flowery kousso Because a dog looks at the end of his tail it is no reason that he is afflicted with worms, or that his innermost parts should be converted into an apothecary shop. The fond master buttonholes his veterinary friend in the street to tell him that he has just given his dog Dana pill. He smiles most blissfully, as if he had performed some feat similar to making a double shot. He left Dan much better-the dog was in perfect health. On his return home Dan, having become restless from internal rumblings, wanders about in a listless way until a fly or some crawling insect tickles his ear. He shakes his head to drive the prowler away, which assures his good master that his favorite is a victim to canker. Vile concoctions are at once squirted into his brain, and new nostrums poured down his gullet. Rendered ten times more restless, the dog totters around in his canker-cap like some old woman at a fair. It now occurs to the doting owner that he has not yet felt the dog's pulse; this is done, because the master feels reassured. A brace of fleas now put in an appearance, and Dan tries to remove them with his claws it is then apparent that canker is not the evil, but mange. The cap is removed, and the dog, delighted to regain the freedom of his ears, flaps them to his heart's content. This action causes serious indecision in the mind of his master, but at last mange gets the uppermost, and mixtures and decoctions are plastered over the animal's coat, the dog being fortunate if all his hair is not clipped off and his skin sand-papered to kill the parasites that lie Frequently the animal has to endure an attack with patented appliances, directed somewhat after the manner of Munchausen's bear. When at last sleep falls upon the tired victim his twitchings are taken for chorea, snortings for lung disease, while his anxious master groups and is at his wit's end. Thus this illustrates the fondness of man for his dog and the iron constitution of the animal.

The great secret, however, to prevent the real sickness of dogs is early and constant care. The kennel in which they are housed should be kept scrupulously clean. We believe, for sanitary purposes, that all kennels should be built of wood, so that if any infectious disease should at any time attack the stock they can be burned to the ground and new kennels rebuilt in their place at but

trifling expense. It is a well-known fact that kennels, and even hospitals for the matter of that, become impregnated with the germs of disease, and the contagion, under certain conditions, is sure to crop out at some future period.

As it is the flooring that becomes the most damp and foul, and is so difficult to keep dry and pure, it occurs to us that all kennels should be raised from the ground a sufficient distance to let the air have full sweep under them. The floor then being made movable, could be arranged to work on a center pivot at each end, thus enabling it to be reversed daily, and when in position to be secured by a bar or bolt. This would always present a dry floor every twelve hours, while the soiled side could be washed and left to dry and sweeten in the air.

Food of the proper quality and quantity is fully as necessary as cleanliness, and should depend upon the breed and temperament of the animals, and whether they are being worked hard, or laying by during the close season. A dog requires more meat when he is being shot over than when he is only being exercised, and at all times the Indian mush should contain vegetable stuff and greens. Water for dogs cannot be too pure, cool and fresh, and the best kennels are those which are supplied by a running stream. If anything, pure water is more desirable than fresh food.

 $Thus, under the above {\it systematized arrangement}, should$ a dog be taken sick the kennel-man will discover the change at once, and often as readily be enabled to trace the sickness to its cause. It is delay, ignorance and the abuse of medicine that causes the direful diseases of which so much has been written. There are but few disorders which if taken at once in hand, and by the exercise of proper judgment, cannot be nipped in the bud. It is the mania for dog-dosing, procrastination in attending the dog when the disorder first makes it appearance, which proves fatal and causes our duty to be such a difficult and so thankless a one. Rarely is it that our advice is called upon until all experiments have failed at home ; and although then we are but imperfectly informed, we are expected to prescribe a treatment which will in all cases cure, there being but little margin left for the sweep of death's sevthe. Unfortunately for the many, we are not clairvoyants, nor possessed with the secret of the grand elixir, or with the healing salve of the great Bakhtyar Nameh-would that we were, that we might distribute broadcast our samples free.

Like the diseases of human beings, those of dogs require a treatment which must be governed by each individual case, as there is no specific to cover each distinct ailment. If, therefore, our friends will remember this, and carefully describe the symptoms of their dog's disorder on its first appearance, we will be enabled to administer more thorough advice, and will at once give each case our careful attention. To enable us to proceed in the Field Department of this paper in a comprehensive way, we have arranged to furnish a report on specimens. They should be forwarded to the Columbia Veterinary College, No. 217 East Thirty-Fourth street, this city, and in all cases the express charges must be pre-paid. This arrangement will admit of our treating diseases of an epidemic character in the most direct way, which may lead to the saving of many valuable animals of the same kennel.

MAKING THE ROUNDS.

W HY should we not, just as well as our cousins across the water? What is to hinder our racing men from deriving all the benefits, advantages and ex-periences of a regular series of "rounds" along our coast during the breezy months of spring and fall, and from cruising, as at present, during the beated term when most men can spare a lengthy period or vacation to an extended voyage and life aboard their yachts? Racing among the larger vessels in the American fleet has become almost obsolete, and but little of it is done in New York waters. A little more liberality in ideas and a few concessions exacted from the close corporation system, now the fashion, will serve immeasurably the public ends of yachtracing, put much life into the sport, and above all make it worth while for the ardent lovers of a match to keep their ships in trim for such work, if necessary, from the day they ship their hands to the day they haul down their fighting colors and lay by for the icy interregnum of the fierce winter's blasts. A little amicable cooperation on the part of leading members among the larger clubs would change the aspect of affairs totally. From an occasional desultory club race, calling out but a meager list of representatives, we could and ought to have a regular series of "fixtures," so framed with regard to date and entries that an owner could count on racing his vessel not once or twice a season, but a score of times if he feels inclined, thereby footing up his "totals" for the year to something he can look back upon with pleasure and satisfaction.

To this end three things are necessary. Matches should be open to all yachts of certain designated clubs supposed to be the peers in the community of the club offering prizes. The latter should represent purses or cups of a value proportionate to the expenses and trouble involved in coming to the line, and finally the dates of races should be harmoniously settled in order that owners may take advantage of the opportunities offered. To this we may add a fourth requisite, the offering of "town" or "citicups by the municipalities or by voluntary sub zens," scription among the residents of those ports whose trade and society will be enriched by the congregation of yachts a public match would induce.

In a modest way something of this sort has already been attempted from time to time, and the results have always been so satisfactory that we hope to sec a similar line of policy pursued after a more permanent and definite as well as enlarged fashion, When once the ball is set in motion it will keep rolling of itself. One season such as we here propose, would put racing among our craft of large tonuage on so sound a basis that we would hear no more sorrowful wails about its decline. It is not that the spirit of racing is absent, but simply because the opportunities are wanting and the direction in which to oper ate not understood that an apparent pall of apathy has overtaken the racing of the big ones.

There is nothing in the Constitution which forbids cities from offering ample purses when the general public is thereby to be benefitted. Such offers are not merely for the welfare of a class, but would serve in many in stances to stir the life blood of trade in sundry sleepy towns along the coast to an unwonted extent, and put sheckles into the tradesmen's pockets. Besides, we have plenty of precedences of the kind and similar appropriations have been made time and again for like purposes often enough without as much gain to the community as the presence of a fleet of yachts and the attendant crowd of visitors would produce. The tender official consciences of mayors and city adminstrations can therefore vote public regattas without the least compunction as to a sacrifice of their chances in the next world, and since the benefits in this are evident enough or could be readily made so, we ask the various municipalities along the Sound and "down East" to consider these lines in the light of an open letter addressed to them for the benefit of the interests they are especially charged with. thousand dollars out of the strong box of Port Jefferson, Greenport, Stonington, Saybrook, Salem, Duxbury, Ports mouth, and double the amount from the coffers of New Haven, New London, Newport, New Bedford, and Portland, with five thousand from Philadelphia, New York, and Boston, would not only give yachting such an impe tus and fresh lease of life as it has never yet had, but would return many times the amounts named to the credit side of the public ledger in the way of trade and popularity, reaching all classes, from the huckster to the mayor who may keep a livery stable or be a bank president. There is a mine to be worked in this direction, and the port which takes its cue from these columns will the first to reap the harvest of stray coins which are the proverbial accompaniment of the yachtsman, and many a fair one will be induced to impart her luster to a community the very existence of which was a geographical uncertainty before its name became linked with the fame of a great yacht match.

If, then, the leading clubs join hands, what is there to interfere with the establishment of a regular round from New York to the East, and from the East to New York?

With the Seawanhakas starting the ball with an open Corinthian match, say in early June, the Atlantics following in a week, next the Brooklyn, if that club is to be revived, as we hope it will, the New York Y. C. toward the latter part of the month, the professional races of the Scawanhakas following in rapid succession: let the fleets then begin to gradually work their way to the eastward, whether in squadron on a cruise or with a roving commission, and pick up what there is in the way of town cups and citizens' prizes. All the above races, it must be noted, should, in accord with the programme proposed, be open to yacht clubs willing to recognize each other as brethren of the same color, and the entry should by no means be confined to the half-dozen likely racers of any

one club.

In the East the same tactics should be pursued. The Portland, the Eastern, the Boston, the Salem, the Dorchester and other clubs, can throw open their lists to all When the local comers, and arrange dates to suit. matches have been decided, they will make their way around the dreaded Cape and take in the municipal events that may offer at the Vineyard, New Bedford, etc., and be on hand in time for the grand affair of the season, a series of three or four days' racing off Newport, the waterplace of America, and which by popular selection ing r should become the Cowes of this Continent. There, in the month of August, might be found the very flower of all the great clubs, the sloops, schooners and steamers and a finer pageant than the races they would sail could not be brought about in any other quarter of the globe.

when yachts of Eastern build When the battle is over, shall have pitted their keels and lead against the skimming hulls of our smooth-water flyers, and the lockers of the best shall groan with the weight of cups and mementoes of the season, or the bank books of the flectest be swelled by the thousands, then lot the swallows of the summer he homeward bound again, the flyers from the East hoist their pennants for the outside voyage, those

of the West watch a chance for a smooth sea and a fair wind to waft them once more through the Fisher Straits into the placid waters of the more congenial Sound. On the return passage fall racing should be found at such ports which have postponed their dates so as not to clash with other events, and finally a series of matches at home would wind up a season that has been spent to some advantage, that has brought all yachts of the country together to test their metal, that will pass into history and form a topic long to be cherished and remembered, that would be vacht racing indeed!

Business interferes? Not a bit of it; on the contrary no means could be found by which the business hours of the business man would be taxed so little as by this systematic method of racing. As nearly all the yachts referred to carry paid hands, and many of them are quite liberally supplied with this article, why let the yachts lay idly at anchor week after week with the hands growing sleek off the cabin pantry? The oftener the owner is on board the better, but it is seldom that his presence is really necessary in a match-some are in the wayand as long as he has to foot the bills, let him get the equivalent from his craft by sending her the rounds of the racing ports in charge of her master, or a friend, and join her by rail, or steamer whenever he has a chance to quit Exchange and feels like getting a whiff of the Lord's free air once more and the sight of a horizon not bounded by brick. The Sound and the East are accessible alike, and the time consumed in getting in and out of harbor when at home might as well be spent on the cars or a steamer carrying the owner within hailing distance of his ship, the trip being made by night with "all the modern conveniences," if time be precious.

As to expense, when once fitted for racing, as all vachts which indulge in a match only once a year generally are, beyond the hiring of extra hands for a match. it amounts to little or nothing. A slight saving in Piper Heidsieck will cover the bill, and what genuine vachts man will begrudge his gear its needs while living high down below?

When the interests of the sport have grown and developed on the Lakes, a similar series of "rounds" may be instituted to serve like ends upon the great fresh waters of the inland districts.

It is pleasing to know that as long as we cannot have the whole programme, there is some chance of several clubs combining to meet during the summer, with a view to racing in a manner similar, to all intents and purposes, to "open" matches; and that the efforts of those interested may be the means of rousing the dormant spirit and waking up all hands to the opportunities now passed by is the wish of every good and loyal tar.

Let us once have racing carried on in a business-like way, and we warrant a heavier crew of seamen among bankers, lawyers, brokers and merchants, and a sounder lot of yachts in our fleet in a single year than we row turn out in a decade. We are tending in the right direction as it is, and are bound in the end to bring up just as indicated above : so we trust these remarks may do something toward hastening the day when the pienic features of racing and the shriveling isolation of clubs, now all drawn up and petrifying in their own shells, will give way to something akin to what all devotees of the sport would rejoice to see-racing carried on upon a broad national basis, not upon the vacillating hobbies and caprices of a set, a clique, a club.

THE CORRUPTION OF SPORT.

OR some weeks past there has been a famous battle of brains in Gotham. The champions of the chess board have found worthy antagonists, and the mimic war of white and red waged ruthlessly, while the chess world stood with suspended breath looking over the shoulders of the combatants. And now that it is all over. and the "championships" duly awarded, it has leaked out that there were unseen agencies presiding over the destinies of the heroes, and upon the battle-field moved potent agents as noiseless and as unsuspected as the gods upon the battle plain of Troy. The American Bird o Freedom, as she appears in conquering pose upon the coin of the realm, screamed harshly and effectively in the strife, and the Goddess of Liberty in gold proved a formidable antagonist of the Queens in red and white ivory. This evidence of foul play in an intellectual game, which from its very nature is supposed to be "above board, has naturally shocked that portion of the public which had not already wisely concluded that such a denouement would naturally follow the conclusion of the chess tour-

America, our college professors tell us, is in her money making stage; and it takes a less astute individual than the ordinary university professor of Political Economy to see that the average American citizen is-to employ a very slang but a very significant expression-"on the The mighty dollar is the controlling agency in every branch of social and public life. Possibly ceneralization may sufficiently account for the mercenary clement of so many forms of alleged sport. Generous emulation in physical strength or skill gives place to sordid clutching after purses, gate money, entrance fee or

prize-provided this last be convertible into cash. are not now necessarily referring to the notorious pedestrian hippodromes, nor to ring encounters. We have in mind more than one shooting club whose weekly meetngs are only so many gambling schemes among a clique for the gathering in of the purses and entrance fees. By a preconcerted understanding this ring manages to secure to its members the various money classes, and so divides the stakes. The confiding stranger who has come to pit his skill against theirs is unmercifully and remorselessly fleeced and packed off for the simple gull that he is. And yet these very trap-shooting pot-hunters will affect to regard with virtuous indignation the recognized pothunter who shoots game for the market. If there be a distinction between the two, we submit that it is a distinction without much, if any, difference. One shoots for the money directly; the other, for that which will The same style of proceedings not bring him money. unfrequently occur in rifle shooting. The history of American yachtracing contains some most disreputable records of a similar dishonorable and unsportsmanslike character. Base-ball has long since been unhappily relegated to the control of the ticket and pool seller, and a sport which possesses many merits as a popular, inexpensive and practical pastime thereby sadly cast into

With the constantly recurring examples of this mercenary feature of participation in sport, true devotees of sport for the sport's sake need not be warned against implicating themselves even in the appearance of evil. Our popular pastimes are too important in their hygienic influences alone to be cast into a disrepute which will bar gentlemen from engaging in them and reaping their benefits. We note with great pleasure and as a welcome sign of the times that some of our gun clubs have abolished morey prizes in their regular club matches. If members are inclined to contend for purses, they are not debarred from so doing; that is their matter. But when the club shoots as a club the competitions are so conducted that the participants are contending for well earned and respected superiority in quick sight and steady aim, not for a paltry sum of money. It behooves sportsmen who would win most credit for the particular form of out-of-door recreation which they may select, to jealously guard its associations from contamination by the presence and influence of the pot-hunting trap shooter, rifle shot and yachtsman. Happily for the gentle art it can never come within the category of the pastimes which are bought and sold.

SPORTSMEN IN CONGRESS.

SENATORS AND REPRESENTATIVES WHO LOVE ROD AND GUN.

THE number of sportsmen in Congress at the present I time is another evidence of the constantly increasing propularity of field sports. Members of Congress are representatives of the people in more senses than a political one. They reflect the social and mental status of their respective constituencies by their manners and conversation in private, quite as well as they represent the views of their political party by their votes in the House. A dapper, gentlemanly Congressman from New England or the Middle States is as different from the representative of a frontier district as black is from white. An expert can almost invariably tell from what section of the country a Congressman comes by his dress and general appearance. A majority of the members of the House are lawyers. If not sportsmen themselves, they have at least an idea of what the true sportsman desires to be, from knowledge of the game laws and experience in actions for trespass and violations of those laws. Before the war the sporting gentleman in Congress almost invariably came from the South. Even he was not a wing shot nor a master of the long range rifle. His kennels were filled with fox and deer hounds, and his stables contained hunters which would do credit to the fields of England and Scotland. To him the deep mouthing of his hounds was the sole music of the chase, and of the infinite pleasure of the silent tramp behind the setter and pointer he knew little or nothing. At that time the hunter in the East never came to Congress. He was a being who was generally regarded by his money-making neighbors as a lazy, ne'er-do-well, whose only redeeming traits were his boundless good nature and willingness to divide his game with his friends. The farmer usually owned a gun, but it was used as a weapon of defense against predatory animals and birds, and occasionally as the means of securing game which was known to abound in adjoining forests.

Now there are three members of the House who have won prizes in pigeon matches. There are a dozen members who are expert wing shots, and the number of Senators and Representatives who take their vacations in company with rod and gun cannot readily be estimated. I will mention but a few of the centlemen in Congress who are expert fishermen or hunters. Foremost in the list of experts with rod and fly is Vice-President Wheeler. Fishing is his sole means of recreation when Congress is not in session. With only one exception, during the past eighteen years he has disappeared from sight in the wilds of the Adirondacks for several months each summer.

The Sarame Lakes are his favorite resort, and the trout is his favorite tish. Great stories the Vice President can tell of his fishing trips through the great forests of Northern New York. He has taken the heautifal trent from streams where never before a fly had been cast. He has witnessed the invasion by fourists of choice pools discovered by himself, and has seen the spotted beautifus nearly exterminated from lakes and streams where they once leaped to his attractive flies in countiess numbers. A year ago last summer Mr. Wheeler took Mrs. Hayes and a party of ladies and gentlemen from Washington to one of his favorite resorts in the Adirondacks and gave them a taste of camping out and fishing.

Senator McPherson, of New Jersey, is an ardent sportsman. He owns two setters, one a pure blooded Irish, and the other of thoroughbred English breed, which, it is his boast, can be lunted day after day without speaking a word to cither. They are broken to perfection, and their movements in the field are directed solely by motions of the hand. Until the past season Mr. McPherson has always kept a sufficient number of birds on his country place in Northern New Jersey to afford him and his friends excellent sport. Last spring his handsome country home was destroyed by fire, and the quali on the estate, it is feared, have suffered from trespassers. Besides quali shooting Mr. McPherson has suffered considerably from illness consequent upon too strict attention to his duties as Senator and his business in Jersey City. Last summer, not feeling strong enough to endure the fatigues of the chase, Mr. McPherson went to the Thousand Islands and anused himself by taking five pound bass with a five ounce rod from the waters of the St. Lawrence. In this agreeable exercise the Senater quiterceovered his health.

Senator Watel Hampton, of South Carolina, is a true sportsman. The best evidence of his devotion to the charms of the chanker. General Hanudom went

Senator Wade Hampton, of South Carolina, is a true sportsman, The best evidence of his devotion to the charms of the chase is the single leg on which with the assistance of a crutch he is compelled to drag himself about the Senate chamber. General Hampton went through the war, fighting boldly in several of the most desperate battles of the rebellion and escaped without serious injury. A year ago General Hampton, who is very fond of riding after hounds, participated in a fox chase near his residence in South Carolina. The horse upon which he was mounted proving a useless animal, General Hampton, rather than abandon the sport at upon which he was a feered in the property of
Senator Hasslin, of Matine, is fond of fishing the Ramgeley Lakes being his favorite resport for sport. Sena-tor Windom is also something of a sportsman. There are other Senators fond of gun and rod, but those I have named are the only ones who may be considered devoted

other Senators tone on such as the second to field sports.

Foremost among the gentlemen in the House, who are sportsmen of repute, is Mr. Acklin, of Louisiana. I visited him at his handsome residence on Capitol Hill recently to examine his extraordinary collection of fire-arms, all made for him to order by a London firm. The barrels of his pistols and guns are of finest Damascus steel, and the wood used in their construction is English walnut. Mr. Acklin is one of the very few gentlemen in Washington who now owns regulation duelling pistols. They can be loaded either from the breech or the muzzle, so as fully to comply with all the regulations of the code. The barrels are about a foot long, 28 calibre, and two-pounds pull of trigger. These pistols have never been used in the field, although they were spoken for last winter at the time Senators Conklin and Lamar had their wordy difficulty on the floor of the Senate. The insulting language used by these Senators was afterward recalled, satisfactorily to both gentlmnen. Mr. Acklin is an expert shot with the pistol. The two duelling pistols osa Mr. Acklin in England §315. First, in the collection of shot guns culty on the floor of the Senate. The insulting language used by these Senators was afterward recalled, satisfactorily to both gentlmuen. Mr. Acklin is an expert shot with the pistol. The two duelling pistols cost Mr. Acklin in England \$315. First, in the collection of shot guns shown the correspondent, was a 12-guage-weapon claristened the "snipe gun" by Mr. Acklin. This gun weighs eight and a half pounds, and has the Purdy top-action. An invention of Mr. Acklin is attached to this, and to all of his guns. It consists of two small steel projections from each side of the standing bridge, so that the barrels when sampled down ready for firing fit closely on each side between these projections. The design of the invention is to prevent lateral action, as from continuous firing of one barrel the tendency of the shock is to force the barrels to one side. Mr. Acklin's duck-and-pigeon gun weighs eleven and a half pounds. The single breen is provided with four sets of barrels, and it really answers the purpose of four distinct guns. Two sets of barrels are 10 guage, in which the customary charge is seven to eight drachms of powder. Two sets of barrels are 10 guage, in which the customary charge is seven to eight drachms of powder. The barrel is re-choked to suit all distances at the trap. One set of barrels is full-choked, and the right barrel is a modified choke, and the right barrel sare flowed to suit all distances at the trap. One set of barrels full-choked, and the right barrel is a modified choke, and the right barrel is a modified choke, and the right barrel so nother set the left barrel is modified choke, and the right barrel is a modified choke, and the right barrel so provider and an explosive bullet is the customary load. Recently Mr. Acklin's fire-arms, bought from Purdy, cost limit, including custom's duties, over \$8,500. The represendance this kennel, and gave thirteen blooded set

to his friends.

The plantations belonging to the Acklin estate are on the Bayou Teche opposite the mouth of the Red River. It is a wonderful country for game birds and wild fowl. Snipe, woodcock, quail, ducks, geose, etc., are always plentiful in season. There is no finer snipe sho ting in

the world than in West Feliciana Parish. In 1875, Mr. Acklin kept a record of his shootings. On March 17th of that year he bagged 392 suipe, and on the day following. 241, making a total in two days of 543 suipe killed by a single gun. Mr. Acklin is of the opinion that this record has never began beaten, Mr. Acklin has two gold medals won in championship pigeon matches. One badge bears the inscription, "J. H. Acklin, Champion Pigeon-Shot of the South." The other medal styles him "Champion Pigeon-Shot of the South." The other medal styles him "Champion Pigeon-Shot of Louisiana." Both medals were earned in New Orleans. Mr. Acklin he lieves that he did his best pigeon shooting in Memphis, where he killed forty-eight out of fifty, double birds. Mr. Acklin's duties in Congress occupy his time fully and he has no opportunity to indulge in his favorite sports. He hus shot in a few sweepstake matches with friends here in Washington and almost uniformly canne off winner.

staße matches with friends here in Washington and almost uniformly came off winner.

Another ardent hunter and trap-shooter is Congressman Finley of the Eighth Ohio District. Mr. Finley is a lawyer by profession, and every spare day that he can find during the season is spent by him in the field. There is some tolerably good chicken shooting in the vicinity of Mr. Finley's home, but when he can take a vacation of two or three weeks he starts for Spirit Lakes in Northwestern Iowa, where he slaughters ducks and chickens to his heart's delight. There is good fishing in the lakes too, and the rod and line are always companions with the gun and the rod and line are always companions with the gun when the Ohio Congressman starts out for sport. Mr Finley is an expert at shooting glass balls. He uses a

n. Anson G. McCook of the Eighth New York Disoen. Anson o. accook of the Eighth New York Dis-trict also has a reputation here as a good shot before the trap at pigeons or glass balls. Of Mr. McCook's perform-ances in the field I know nothing, but he possesses all the physical requirements of a good shot, and his ability at the trap was learned, I believe, from previous experi-ence in the field.

the trap was learned, I believe, from previous experience in the field.
Congressman Poehler of the Second Minnesota District holds prizes won at the trap. He is a member of the local shoeting club at Henderson, Minnesota, and a member of the State Sportsman's Association. Pinnated grouse are found in abundance near. Mr Poehler's hone, and he is a constant hunter during the season. Mr. Poehler was born in Germany and came to the United States in 1848. All that he knows about wing shooting has been learned by him on the prairies. Mr. Poehler is a sportsman in the highest sense of the word. The Daly is his favorite gum.

has been learned by him on the prairies. Mr. Poehler is a sportsman in the highest sense of the word. The Daly is his favorite gun.

Join E. Kenna, of Kanawha, West Va., has represented the Third District of his State in Congress two terms. Mr. Kenna is an enthusiastic deer and fox hunter. Every year a party of gentlemen from Kanawha go out for a week or two with hounds and have a royal good time. There are few birds in the mountainous region in which he resides excepting ruffed grouse, and that Induly bird is seldom found in great numbers. The fox hunting near Kanawha is done on foot. The members of the Long Island Club may be inclined to laugh at the idea of following hounds on foot, but a single visit to the mountain' country of West Virginia would at once dispel the idea that hounds there could be followed on horseback. The hunting field is a succession of high rocky ridges or spurs from the mountains, leading down to the creek bottoms. As soon as the dogs strike the trail the course that there will be a supplied to the following hounds in full view of the hunters, the hounds in full tilt after him. Being closely pursued reynard crosses over to another ridge; the hunters follow, obtaining another view of the inspiriting picture, and so on until the chase for the word of the concentration the independent of the concentration of the concentration of the chase ones. The velleties of this healtful exercise, the grand mountain secrety, and the opportunities afforded alwing the chase for the word of the concentration the independent of the concentration the independent of the concentration the independent of the concentration that the chase for the word of the concentration the independent of the concentration the independent of the concentration the independent of the concentration that the concentration of the concentration o

chase ends. The delights of this healthful exercise, the grand mountain scenery, and the opportunities afforded during the chase for the use of the gan cannot be imagined by one who has not participated in the sport. It must not be thought that all of the sportsmen in Congress delight in the pursuit of small game. One of the most famous bear hunters in California represents the Fourth District of that State in the House. Romnaldo Pacheco, of San Luis Oblisho, is the gentleman's name, and he estimates the number of bears he has killed himself, or has helpdd to kill, at 100. Mr. Pacheco was the son of wealthy parents who owned intense grazing lands and flocks in the neighborhood of Santa Barbura. As soon as he was able to sit astride a horse he learned to ride, and at the age of twenty-one hwas an expert horse-ride, and at the age of twenty-one hwas an expert horselands and Bocks in the neighborhood of Santa Barbara. As soon as he was able to sit astride a horse he learned to ride, and at the age of twenty-one he was an expert horseman. Mr. Pacheco also became unusually proficient in the art of throwing the lasso, an implement which was used by all herders. Bears were plentiful near his home, and Mr. Pacheco learned to hunt them as follows: —Four men, experts in the use of the lasso, would ride to the place where bears could be found. Getting upon the trail they would ride after bruin and bring him to bay. While the bear was standing upon his haunches cach of the four men would almost simultaneously throw their lassoes over his head, and riding in opposite directions strangle the animal or fasten his legs so he could not run, when he would speedily be dispatched. An unusually acute imagination is not required to perceive if one of the four lassoes failed to encircle the bear, or the horses ridden by the lumiters were not perfectly trained, that the consequences might be extremely unpleasant. Mr. Pacheco Lells a number of blood-curiling stories of accidents which have happened in the pursuit of bears with the lasso. Of the other members of the Bouse who are good shots and fond of hunting I will name General Joe Hawley, of Connecticut: Mr. Robertson, of Louisiana, and Mr. Gunter, of Arkansas.

Washington, D. C.

GAME PROTECTION.

TAX THE GUNS,-We invite the fullest expression of opinion upon the question of taxing shot guns. A New York correspondent writes as follows :-

NEW YORK, Feb. 2d. Editor Forest and Stream :-

Editor Forest and Stream:—
Inotice that there is a movement in Albany toward a
two-years' prohibitory game law. There is only one class
of sportsmen that can profit by such a law—that is, the
pot-hunters. Laws or no laws, the pot-hunter will be
bound to shoot, and a certain class of marketmen and
hotel-keepers will be found ready to buy their game. Allow
me to ask you, Have we not game laws enough? I shall
say we have too many, and they are too complicated already. The game laws are broken every day, but how

often do you hear of anybody being fined or punished? What is the reason? Because nobody takes the trouble to complain, and averybody has not the time to do it.

I have heard of quail having been brought to New York last month through the Long Island Railroad, by the brakesmen and baggagemen of that road. Why, os a sportsman, did I not make any complaints? Because I had not the time to do it, and, besides, very likely I should have had to fight the whole railroad company, with very little prospects of having the seoundrels punished. Every sportsman knows that on the 31st day of last December there was more game left over than there was at any previous year, at least for the last three years. I am told that whole coveys of quail were shot by pot-luniters on Long Island within the last three weeks.

of last December there was more game left over than there was at any previous year, at least for the last three years. I am told that whole coveys of quaid were shot by pot-hunters on Long Island within the last three weeks, while this last snow lay on the ground.

Why, then, should we have this prohibitory law passed, all for the benefit of those pot-hunters? For my own part, I do not care whether this law is passed or not. I can have all the shouting I want, if not in this State, in some other. But as a sportsman I protest against the passage of such prohibitory law. Everybody has not the time or the money to go West or South, and I am not selfish enough to see those that cannot go elsewhere deprived of their sport. If such a law should be passed, what is a man living in the city to do with his dog, especially if he is a good one? I have talked this matter over with a good many shooters, and they are all of the same opinion—such a law will only benefit the potunter and the marketman because the pot-hunter will have so many more birds to shoot at, and the marketman or hotel-keeper, having to sell them on the sly, will charge and get so much more for them.

What, then, is to be done to save the birds? The answer is very simple—enforce the laws that we have got now. The Society for the Prevention of Cruelty to Animals has its special officers; why should we not have our? The Society for the Prevention of Cruelty to Animals paysits own officers; why should we not pay our own? What with, you will ask me. I think it could be done casily, as long as we keep it in our own hands, and do not let the politicians get hold of it. First, let here be put yearly as long as we keep it in our own hands, and do not let the politicians get hold of it. First, let here be put yearly as long as we keep it in our own hands, and do not let the politicians get hold of it. First, let here be put yearly as long as we keep it in our own hands, and do not let the politicians get hold of it. First, let here be put yearly as long as we keep

in use—mark, I only say shot gun: I not not include the rifle. This would not interfere with nor infringe on any constitutional rights or liberties. Our patriotic young men could keep up their practice with the rifle, and the sportsmen—the only one interested—would have to pay for their gun. Secondly, let each shooting club in the State be assessed yearly from fifty to one hundred dollars, according to the numbers of their members. By these means there could be monoy enough raised to get, all over this State, efficient men, paid well enough to protect the game and to have the game laws enforced. Let such men be appointed so as to have power all over the State, and not in one single county, and thereby you will soon stop all surring and trapping, all shooting and selling out of season, and we shall have no need of any prohibitory law. The pot-hunters will disappear, and whoever will carry a gun will be more or less the ideal of a true gentleman.

man.

What say my sportsmen friends about this? Any-how, let them raise their voices against any prohibitory laws.

A TRUE LOVER OF THE SPORT,

MICHGAN SPORTSMEN'S ASSOCIATION.—The fifth annual meeting of the Michigan Sportsmen's Association at Bay City, Mich., last week, was attended by a large and en thusiastic delegation of sportsmen from the various clubs of the State, and was in every way a grand success. Elaborate essays upon various subjects of interest were read, and the Association well sustained its reputation as an earnest body of men.

Exporting Quall From North Carolina.—Monroe, N. C., Feb. 2d.—Editor Forestland Stream :—I see by your last issue that a gentleman now at High Point, N. C., proposes to make arrangements for the shipment of quail from that town. He, perhaps, is not aware that there is a law to prevent the shipment of quail out of the State, and it was owing to the fact of so many birds being shipped from there and Greensboro, a town a few miles distant, that such a law was passed. I learn that nearly two hundred birds were at Greensboro not long ago; the party attempted to snuggle them through, but unluckily for him, one of old "Bob White's" feathers was seen sticking out of the box a little too far, which led to the discovery. The man trying to ship them got wind of news and was seen no more. That agent no doubt had bird pie for days.

Deer in Vermont,—Bennington, Vt., Feb. 9th.—The

DEER IN VERMONT.—Beautagton, VI., Feb. 9th.—The deer placed on the mountains at Manchester have reached this place. One has been on the East Mountains for several weeks and is quite tame. Some hounds started one the other day and it ran through the upper part of the village. The farmers and lumbermen in the vicinity of Woodford claim that they have seen three or four at once, and that they are very tame, coming off the mountains and feeding with their cattle.

Maine.—Bangor, Feb, 5th.—The Norombega Shooting Club, for the protection of game and fish and improvement in wing shooting, was organized last evening, with John P. Tucker, President; T. White, Vice-President; W. F. Seavey, Secretary; Fred T. Hall, Treasurer, the President, Secretary and Treasurer, ex officio, with Messrs, Durgan and Abbott, constitute the Executive Committee, The Bogardus rules of shooting, with a constitution and by-laws were adopted. The organization starts off with eleven members and will receive many others.

New Jersey Quall Season.—Toms River, N. J., Feb. 5th.—Permit me for the benefit of your readers to make a correction in an article appearing in your Game and Fish Directory, issue of Jan. 20th, dated Riverside House, Forked River, Ocean Co., N. J., wherein it is stated that the open season for quali is from Nov. 1st to Feb. 1st. It should read from Nov. 1st to Jan. 1st., for the latter date is that on which the season closes in this State.

H. C. Glover. H. C. GLOVER

President Ocean Co. Game Protective Association.

Game Bag and Gun.

GAME IN SEASON IN FEBRUARY.

Hares, brown and gray.

Wild duck goose beant etc.

Poor.Wild Turkey, Woodcook, Quall, Snipe, Ducks, and Wild Fowl.

"Bay birds" generally, including various species of plover, sand piper, sulpe, criticew, oyster-calcher, surf hirts, phalaropes, avoctes, cto., coming under the group Hunacote or Shore little.

GAME AND FISH DIRECTORY.

In sending reports for the Fonest and Stream Directory to In sensing reports for the rolliest AD Standar Directory to Gamo and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value; State, Town, County; means of necess; Hotel and other accommodations; Gamo and its Sasson; Fish and its Sas-son; Boats, Gindes, etc.; Name of person to address;—after the following model:MINNESOTA-New Ulm. Brown Co.-Reached by Chicago

MINESOTA—Yew Ulin, Brown Co.—Reached by Chicago and Northwestorn Hallway, 467 finles from Chicago. Hotel—Merchant's, Chas, Brust, proprietor; \$2 per day. Proprietor is genuine sportaun; best eare taken of dogs; good delving at reasonable rates. Game—In fall after Aug. 18th, pinnated grause; after Sept. 1st, greec, brant, duck, mallard, canvas-back, teal, etc.; plover, ernac and pelican; not plenty in spring. There are at least a dozen takes within a radius of fifteen miles, where ducks are very pitnity in fall. Fishing—Not very good; plekerel and black bass. For big bars of grouse write to.

C. M. H. HEIDEMAN.

NEW HAVEN GUN CLUB,-Old squaws still remain un New HAVEN GUN CLUB.—Old squaws still remain unusually plenifind, with a good sprinkling of coots. The weather has been so windy of late that there has been but little shooting done in that line. Foxes and rabbits are very scarce. Amstrong & Fulton have concluded not to furnish any more game for the East Haven hotels through their agent, Capt. Stephen Thompson. We were surprised to see Folsom's heart fail at the last feather ball shoot, backed as he was by the little Alderman gun. Our President expects a fine rabbit dog, which Howard is breaking for him. He gave us a field trial exhibition in Pop's store the other night, and all declared it first class. Scisson Actron.

New Jersey—Toms River, Fcb, 7th,—Some ice this week, but all gone again. Yesterday, Friday, was the best shooting day of the season in Mosquito Cove. Thirty-eight red-head ducks were killed and bagged in one stand by two men, and good scores were made all round. S. K., JR.

TENNESSEE—Nashville, Feb. 1st.—Foxes, quail, and fish are abundant—each can be found within a few miles of the city, and dogs, guns, and fishing tackle of the most approved kinds are always ready for any kindred spirit which may chance our way.

J. D. II.

ARKANSAS-Maysville, Fcb. 3d .-- Hunting here has ARKANSAS—Majseitte, Feb. 3d.—Hunting here haven poor owing to the warm weather, yet a larg number of deer and turkeys have been killed by the Indians, and hardly a day passes that one or more saddle are not brought to town (current price fifty to seventy five cents in trade). Qualls, ducks, etc., in abundance now, but chickens very scarce.

E. S.

Jasksonport, Feb. 3d.-Geese and ducks here in fair Jasksonport, Feb. 50.—Geese and ducas here it had mumbers now on account, we presume, of the cold weather They are very wild. No other sport. No fishing as yet; but in that respect "every prospect pleases." Yell.

but in that respect "every prospect pleases." Yell.

MONTANA.—Mr. Jameson, the young Irish baron, who, for the past severalyears, has journeyed from the green sod to engage in hunting and fishing sports in Montana, was unusually successful this season, his wagous returning loaded with the antlers of elk, nuose, deer, mountain sheep and antelope, and the pelts of grizzly and black bear, mountain lion, lynx, wild cat and other splendid troplines of the clase. These valuable possessions, carefully preserved and packed, have gone forward to the old country, while Mr. Jameson, disbanding his party of four, and accompanied by his body servant, starts soon on a journey around the world.

Country, which all, Similerson, discarding his party of four, and accompanied by his body servant, starts soon on a journey around the world.

Ducktivo on Big Swan.—Pillsbury, Minn., Jan. 26th.—This lake is situated about 115 miles northwest of St. Paul and is known as Big Swan. It is four miles long and a trifle over a mile in width, and its eastern shore is covered with patches of wild rice which make it just the place for ducks. In company with a gentleman from Massachusetts, we took our duck boat and at early dawn started for the lake, and after some rather hard pulling against the stream (we preferred taking the outlet of the lake for our path rather than the overland route) we soon came to the large hed of rice just at the foot of the lake, where our fun began. We have not space to describe that day's sport, but suffice it to say we bagged sixty-seven ducks and took a good map at noon in the bargain. A sportsman can reach this lake at a cost of about \$7 from \$5. Paul, via Little Falls. Board can be had from \$2.50 to \$3 per week. Sportsmen desiring to visit the place would have a much better time if they would bring camping outfit along with them. The water abounds in pickerel, black rock and "calico" bass, and nearly every kind of fish incident to fresh water. They bit very readily and we have taken from thirty to forty in one day with fly bait. As we sit by the window penning these few lines we look out and count twenty-nine prairie chickens within easy reach of my choke-bore which hangs on the wall. My finger slightly itches to press the trigger of my central-fire Winchester, which is sure to cut their heads off, but, als! the law is out, and I must not indulge. Any sportsman desiring to know more about this place can do so by making it known through the columns of Forest And Stream, or by inclosing stamp and addressing as above.

The Ancient Duck Eaters.—R. M. Pool, the editor of the Nigara Eagls (N. Y.) Caracte has been included.

Sheldon, C. E. Davis, C. H. Piper, Wm. Samways, S. T. Murray, H. F. Pierce, John P. Hulett, Wm. Pool. James H. Boyd and R. M. Pool. Messrs, Witmer and Sheldon have been the hosts at both the "Grand Fats" that have

order have had two sittings at Mons. Romaine's The order have had two sittings at Mons. Romaine's Rendezvous Francais, the second last Wednesday evening, and we can bear witness as a duly initiated member of the society that the cognomen of the order is no vain and empty sounding phrase, but that membership implies an intimate acquaintance with fowl the date of whose death the memory of man runneth not back to recall. The mantle of venerable antiquity that entolds the fragrant dishes is not woven, however, of unsocial and impenetrable gravity, but in its impalpable presence adds a very marked and peculiar mirthfulness to the spirits of

II. Last Saturday evening Mine Host Isaacs, of the Pro-Last Saturday evening Mine Host Isaacs, of the Prospect House, gave an elegant banquet to a number of invited friends from both sides of the river. The invited guests who were present were Messrs, C. E. Davis, J. M. Witmer, J. V. Carr, H. H. Sheldon, Geo. E. Curris, L. W. Pettebone, R. O. Fulton and R. M. Pool, of Niagara Falls; and Messrs, T. F. Ellis and Claus Javis, of the town of Clifton. Messrs, S. T. Murray, H. F. Pierce, F. R. Delano, H. S. Ware and A. J. Hamlin, of this place, and J. P. Hullett, of Clifton, were unable to be present, and sent their regrets.

BUCKSHOT IN CHOKE BORES,-North Platte, Neb., Feb RUGESHOT IN CHOKE BORES.—North Plattle, Nob., Feb. 4th.—I notice in your issue of Jan. 29th two articles on buckshot in choke bore guns. I like both of those gentlemen's mode of loading, but 1 have met with more and better success by loading in the following manner, using a full choke No. 1 power is dress of Dupont's eagle duck No. 1 powder, using 2 pink edge wads on powder as tight as can be put by hand. The gun will chamber 3 No. 4 buckshot nicely at the muzzle. I put 9 of them in the shell and pour hot tallow and white wax upon the shot, and place a thin black edge wad upon them with a neat criup. With such loads I have killed deer at 110 yards. I killed seven out of ten deer dead, the distance varying rinp. With such loads I have killed deer at 110 yards. I killed seven out of ten deer dead, the distance varying from 85 to 110 yards, and wounded two so that they could not get away, and followed the other one for one-half mile and found him, a big buck weighing 180 lbs., dead. Most of the sportsmen here have their shells loaded in this way.

dead. Most of the sportsmen here have their shells loaded in this way.

LARGE Shot in Choke Bores.—Dunbarton. N. H., F.b. 1st.—Why do not some of your contributors who have been describing their several different methods of loading choke bores with large-sized shot give the targets they can make at long range, say 80 yards, instead of saying that such and such a load will stop a deer at 75 yards simply because they may have killed one at that distance. Surely a load which would give a good average at 89 yards, in a 30-or 40-inch target would be more satisfactory than an occasional good target at a much longer distance. A couple of years ago, while making arrangements to go to Florida, I tried a few shots with buckshot in a 10 bore 94, pound gun, 5 drs. powder, 15 buckshot chambered at muzzle, at 90 yards, 40 inch target. The first shot put 5 shot in a 24-inch circle in centre of target. I then thought 1 had the best gun for buckshot I had over seen, but after several shots changed my mind, as sometimes I never struck the target at all, and in most cases only put one or two shot in the 40-inch square. Since then I have tried many of the different ways of loading, such as filling space between shot with melted wax and tallow, using sections of paper cartridges cut to fit the muzzle of gun, etc., but nover could get as good an average as with loose shot. Greener, in his work on choke bores, states that a good gun loaded with buckshot which chamber at muzzle and the space between the shot filled with melted tallow, should put the whole charge inside the head of a flour barrel at 40 yards. This may be so, but it is very much better shooting than I have ever seen.

Now, dropping the buckshot, I would like to ask some

may be so, but it is very much better shouting than I have ever seen.

Now, dropping the buckshot, I would like to ask some of your readers (who own close-shooting guns) what would be an extra good target for a 12 or 10 bore gun, with 4 or 5 drs. powder, 14 BB shot, at 30-inch target, at 80 yards. The best shooting I have seen with this size of shot was made with a 10 bore 10 lbs. Parker gun at 45 yards, 84-inch target, its shots, the average was 33. Same gun and same charge (4 drs. 140x.), at 80 yards, 30 inch target, 4 shots, averaged 114. The 80 yards target was made off-hand, shooter holding about two or three inches above centre of target. Some of the gun makers say that they never have targeted their guns at this distance, and do not know what would be considered extra good. I think it would interest us to know what to expect from a good gun at this distance with the sized shot I have named.

RECOIL PADS.—London, Jan. 13th.—Editor Forest and Stream:—In your paper of Dec. 18th I notice the following: "A La Porte, Ia., gumer was lying in the bottom of a boat, and discharged his gun at some ducks, but not having it firm against his shoulder, the recoil was with such force that he broke his colar bone." It will, no doubt, interest your readers to learn that a simple device for preventing accidents of that nature, or rather for preventing agun from kicking at all, is now adopted by many English sportsmen and military and naval officers. The device is the invention of Col. H. A. Silver, of the eminent firm of S. W. Silver & Co.. of London, and consists simply of an anti-recoil heel plate, composed partly of hard rubber and partly of soft vulcanized rubber, joined firmly together, and fitted on to the but of the gun Lasts. No effort has so far been made to introduce the device into America, but Col. Silver has secured a United States patent, and intends soon to send samples of his heel plates for inspection by American sportsmen his heel plates for inspection by American sportsm and others interested in shooting.

JOSEPH DIXON.

through the columns of Foirest and Stream, or by inclosing stamp and addressing as above,

A. D. Carpenter.

The Ancient Duck Eaters.—R. M. Pool, the editor of the Niagara Falls (N. Y.) Gazette has been inducted into a gastronomical society of that town whose members are not only sportsmen, but bon vivants as well:—

The "Honorable Order of Ancient Duck Eaters" is a local society of quite recent origin whose object of existence is unmistakubly acknowledged in its name. The membership at present comprises Messrs, J. M. Witmer, H. H.

of our guns. Covies well scattered and afforded us two hours' good shooting and many a one missed for another time. "It's strange," remarked J., "how much shot a quail can carry," We netered another field; separated, and had our dogs on two separate covies about the same time. Banging away a half-dozen shells, had them will scattered and working into each other till we had them rising like snipe; still J. was not satisfied; his shells were too heavy. "Loaded too much powder," he remarked; "four drachms. How much do you shoot?" I remarked; "four drachms. How much do you shoot?" I remarked; "I have give a gun all she will stand under, 12 gauge, 8½ lbs., charge 5 dis., 14 ozs. No. 9 shot, is what I use at trap and quail, duck or anything comes along. Use a good gun and pay a liberal price for it; it's a pleasure to use a fine tool." I like to see a bird drop as if hit hard, which caunot be done with small charges. I allow some guns do not require such charges, but it's the exception, not the rule. We had our shooting coats well lined, and started to deposit in our wagon. Stillour dogs came to soveral points, and J. made some remarkably good shots, dropping a quail full 50 yards by giving six feet hold ahead. Further on we sighted a hawk sailing over, As he neared I held on him. He seemed perfectly safe; had taken a good measure with his sharp eye. I ran my gun about six feet ahead and touched the left trigger, to see him double up and strike the hard ground just five yards behind us. "Big loads," I remarked, "havays count." Depositing our game in a safe place from hawks, we agreed to hunt the Colorado bottoms, a mass of grape-vines, weeds eight feet high, nixed up with small post oaks. The dogs could not be seen to feet ahead, and touch they is the dogs were confused, dropping one bird to pick up another. We gathered what we could find, just 4%, and started for home to get the cockle burrs out of our boots, pants and sleeves. Our dogs, orange and white, would have been taken for red Irish on sight. I have seen the

hammerless guns, the most improved shooting coats, belts and every approved tool, and he may just keep even with them.

ALMO.

THE YOUNG TRAPPERS.—They were brothers, aged respectively nine, eleven, and thirteen, named Nathaniel, Peter, and "Philip, whom the boys used to call for short "Nat," "Pete," and "Phili," Like all other country boys thirty years ago, they were suddenly struck with a mania for trapping and saaring rabbits. The woods in which they plied their amateur skill were situated three-fourths of a nile from their native New Jersey village, on a farm owned by one Dr. Kissam, who had in his employ a negro called Joe, who took very kindly to boys. The heavy timber of the woods had been cut down two or three years before, and the old stumps were fringed with a new growth of saplings, which were about the right size to bend down for snares. It was a crisp November afternoon when the young trappers struck a bee-line for the woods. Boys always go "cross lots" when bent on fun. As for the fences, they skip through or over them like grasshoppers, and like them they care but little for the growing crops. Then, too, what wonderful feats of pedestrinains they are capable of? Irist it is a quick walk, so that the smaller lads have to trot to keep up, and then a run, faster and faster as they near the spot where they are to have their sport. Well, they reached the woods in fine glee, with all the necessary implements of war in hand, strings, jack-knives, and sweet apples for bait. They had little difficulty, with Joe's help, who joined them in the woods, in selecting suitable places for their snares. By sunset all were ready for the unwary little "cotton tails." The three sides of a hollow square were haid up, the sapling bent, the string tied on, the moss adjusted, and the bait placed. There were three—one for each boy. Nat's was nearer the edge, of the woods than the others.

What expectations awoke in their breasts that night it How lively their imaginations worked! How they fell askeep with their uninds ful

in his mind to go there before them and rob them of their games.

By the time they reached the words it had grown a little lighter, and as they approached the first snare, Phil, who was ahead, shouted out, "Nat's snare is sprung." They all struck a run through the bush is, and, coming closer, "He's got a rabbit," cried Pete, "No," said Phil, "it's two white for a rabbit; it's a 'possum." When they arrived at the spot the truth came out to their utter dismay; it was a sheep. Such a scared lot of boys you never saw. The woods were in the pasture grounds, and they had actually caught one of the Doctor's sheep. What to do was the question, after they had recovered some from their great surprise and alarm. Near by was the stump of a tree which had blown over. The overthrow had made an excavation where the roots used to be, and they resolved to drag the lifeless canease into that, which they did, and covered it up as well as they could with leaves. Then they hastened to the other snares, which were found unmolested, completely demolished them all, and returned home in a very different mood, as can be readily imagined, from that which they were in when they went there with hearts full of happy anticipation. For one whole week, while Joe was hunting the country over for that lost sheep, the young trappers went about like little criminals, carrying in their anxions bosoms the guilty secret. By-and-by the sheep was found, the mode of its death discovered, and it devolved upon the father of the young trappers to the horsewhile to nut a most embatic fine list to the advised the horsewhile to nut a most embatic fine lists to the advised the horsewhile to nut a most embatic fine lists to the advised the nutries of the young trappers to the horsewhile to nut a most embatic fine lists to the advised the and the nutries of the young trappers over the above when the content of the content of the advised and the power of the father of the young trappers to the father of the young trappers to the father of the young trappers to th By the time they reached the woods it had grown was found, the mode of its death discovered, and it de-volved upon the father of the young trappers to pay for if, and with a horsewhip to put a most emphatic finish to the episode. The boys, however, were agreed in the opinion that a sound thrashing is a light affliction compared with the agony of bearing about in one's boson a guilty se-cret.

TWO WEEKS AT THE CAPE.

Aug. 1st L. and myself started for a two weeks' trip among the marsh birds, our destination being North Chatham, Cape Cod. By four and twenty hours we were safely ensconced in a little shooting sharry, having passed the first night on the mainland, built for the special purpose of harboring the happy individual who, "far from the madding crowd," go there to get a few days' shooting at the bay birds.

This shanty is located about a mile from the extremity of a narrowstrip of land, extending from Orleans, a town

shooting at the bay birds. This shanty is located about a mile from the extremity of a narrowstrip of land, extending from Orleans, a town situated seven or eight miles north of North Chatham, being distant from the mainland nearly a mile and a half, though in places much nearer.

Bill Smith, a worthy gunner, kind-hearted fellow, mine host, and withal a good shot, made up our party. Ne dog was necessary for our sport, so I left Roy (a favorite setter) at home. Once at the shanty we were happy, free from the hear and din of the noisy city we had just left; and after having laden a few shells and exchanged many a good night we turned in and slept soundly until next morning, when, rising with the sun, we each don our shooting-jackets, and with half a dozen decoys in our hands and our pockets filled with shells we repair to our respective stands, or rather pile sexavated in the sand just above high water mark, there to lie perdu, and await, with Izaak's patience, the arrival of the plover, yellow-legs, red-breasts, or any of the numerous sandpipers which throug the sand flats at low tide as far as the eye can seach.

So there I am preader sometical du Turk, and all on

with Eadit's patience, the arrivation in the prover, yenowlegs, red-breasts, or any of the numerous sandipipers which
throug the sand flats at low tide as far as the cyc can
reach.

So there I am, reader, squatted d la Turk, and all on
the qui vive to catch, if possible, any whistle which may
come to me from afar. The report from L.'s gun further
up the beach warns me to lower my head, and ere long
the well-known cry of "the, the, the, the', is heard, and tells
me that yellow legs were the victims of L.'s aim; and
now, bearing down toward me, emitting their cry of
alarm, I desery a small bunch of those birds, which, on
devious wing, are about to pass, but seeing six of their
would-be companions sitting on the strand they swere.
As their sides are exposed I press the trigger, and one
falls riddled by an ounce of No. S, while the others, before they have time to escape, present a good shot for my
left, which is duly delivered. Picking up two Summers
and one Winter, I again resume my former position, and
so the sport continues, until the tide lawing risen sufficiently to cover the decoys forces me to leave the stand
and go to the shanty, where I meet L., who has done
himself credit with his W. & C.Scott & Son, and depositing
our birds on a "brant-pen" hand by, we enter the hut,
and seated around the festive board laden with game (i).
eggs and coffee, discuss the events of the morning shoot
and the probable chance of sport on the morrow.

Horgot to mention that although unaccompanied by
any dogs we did have some four-footed animals about us,
nay, under us; in short, rats lived, sported, and sang
songs to us in the evening when desirous of sleep; be it
unsportsmanklike or not we did kild some of them at dusk
when they came out from under the flooring to attack
our game larder on the brant pen, we did set traps for
the culprits, and we did rejoice when reclining in the
arms of Morpheus to hear their tunes occasionally
changed and to find next morning either a rat or a foot
in the trap.

changed and to him less morning either a table a foot in the trap.

In the evening when not employed in destroying the vermin we would sit around the table reading the FOREST AND STREAM between the frequent puffs of smoke which rolled lazily upward from our fragrant manillas, or, laying aside the latter, would devote our time to loading carticulates.

AND STREAM between the frequent pulls of smoke which rolled lazily upward from our fragrant manillas, or, laying aside the latter, would devote our time to loading cartridges.

"I say, Bill, the brown backs seem to be rather scarce this year, and if they're not along soon I'd like to know when you do expect them, for here it's the 8th of August, now, and beetle heads are not scarce, while the yellow legs, curlew, willet and the hordes of sandpipers are in order, all of which are stated in the vernacular to arrive later than the red breasted snipe (brown back)."

"Well," replied that worthy, "I cal'ate they be either gone by outside, or, following the coast more closely, have crossed down below, for we certainly haven't had much of a flight this season." Whether the squeal of an unfortunate rat is worse than the audible sounds coming from the lowest bunk would be hard to say; be it as it will, neither induced sleep; soon this ceased, however, and our slumber was wrapped in a stillness broken only by an occasional squeak from a night heron who chanced to be within hearing, or by the murmur of the distant billows rolling up on the beach outside.

And so the days pass quickly by, and we pursue our various enjoyments; when the tide favors we are always in our stands, but when entirely out and the birds are scattered far and wide we wade about in the shallows with a sort of spear to pierce the flounders or place-fish which dart off u short distance to bury themselves in the sandy bottom, thus protecting themselves about as beneficially as an ostried does, which, concealing its head under a bunch of leaves or tuft of grass, deems itself safe from its pursuers; these fish, with their back-bones extracted, and fried in cracker-crumbs and eggs, form a very desirable change in our menu. All things must come to an end, and so the "ultima dies" of our jaunt was soon upon us; the brown backs didn't come in numbers sufficient to yield much sport, but the variety of the bags made each day compensated in a part their size. And

SHOOTING MATCHES.

Scores .- Secretaries of clubs are invited to send in scores of matches. Such reports should reach us as early as possible after the date of the meeting.

MASSACHUSETTS.—The third glass-ball match under the auspice MASSACHUSEITS.—The third glass-bull match under the suspices of the Massachusetts little Association began it Wahulu Hilly cester-day, Feb. 11th, and will continue on successive Wednesdays until March 31st inclusive. Match begins it H. A.H.; open to all comers; eight rises, Byrarle; doublerises, Isyards; Hogardus rules; charge of shot limited to 11 ounces; each score to consist of 30 bulls of single, 5 double and 5 rotary, and the prizes will be wood by the aggregate of 5 scores whenever made. The will be decided on the in-

verse order of shots. Exact ties will be shot off. Entry fees for each score, including the balls: Members of the Massachusetts till dasociation, 50 cents; non-members, first entry cach day, 75 cents; all re-entries, 50 cents each; practice scores, 20 balls, members, 30 cents; non-members, 40 cents. Competitors in match to be handicapped. A handicap list of competitors to be posted at the shooting pavilion on the range. Forty per cent. of the entry fees to be divided in seven prizes, viz., 10, 8, 7, 8, 4, 3 and 2 per

Biston.—The Raymond Sportsman's Club have been doing some excellent work before the traps, and are now anxious to meet a team from some other club, as the following invitation will indicate: "Hoston, Jan. 31.—The Raymond Sportsman's Club hereby challenge any organized glass-ball club in the State of Massan." chusetts to shoot a team match for a purse of \$50, \$25 a side. The teams to consist of ten men, each man to shoot at 20 balls, 10 from rotary and 10 double tray. The match to be shot on the grounds of the Medford Rifle Association at such time as may be mutually agreed upon. More than one club accepting the challchge, the ugreed upon. More final one crot accepting the charcoget the purse to be divided into two prizes—60 per cent. of the money for the first prize and 40 per cent to the second prize. Glub accepting to have been organized previous to date of this challenge, and teams to be selected from actual members at present time. (Signéd) James Emery, Tr., Secretary, R. S.C. 32 Commercial

FOUNTAIN GUN CLUB .- Parkville, L. I., Feb. 4th .- Ninth monthly contest of the members of the Fountain Gun Club for a gun, at 7 birds each; handleap rise; 80 yards boundary; 11 ounce shot; from 5 ground traps; the use of both barrels allowed; ties decided at 3 birds each: Yards. Killed.

ESSEX vs. JERSEY CITY HEIGHTS.—Match at pigeous; ESSEX Gun Club, of Newark, N. J., and Jersey City Heights Gun Club; birds each; 5 ground traps; 25 yards rise; 80 yards boundary; both barrels allowed. The match was interrupted by frequent snow squalks, and the birds were a grand lot of flyers—two circumstances which combined to severely test the skill of the contest-ESSEX GUN CLUB.

RIVERTON GUN AND RIFLE CLUB .- Philadelphia, Jan. There will be a monthly trap match on the second Saturday in each month, commencing in February, at 10 birds cach, handicap rise. At the end off the year four prizes will be, awarded the contestants in these matters, on the following terms:—One to the contestants in these matters, on the following terms:—One to the highest aggregate score in any four of these matthes; and one to the rext highest, open to members who are handicapped over twenty-five yards; and two prizes in same manner, open only to members placed twenty-five yards and under. The handicap distance now fixed will continue throughout the year. On the fourth Saturday in each month, until finally won, there will be a contest for the double bird trophy, presented by General Grubb, and for other prizes after that is decided. Hife matters will take place on the third Saturdays in April, May, June, July, August, September and October; and three trophies will be awarded on the following terms:—For the highest aggregate score in any three matches, one prize for one hundred, yards, one for two hundred yards, and one for five hundred/yards; but no member to win more than one prize.

CONCINESSIONAL PIGEON SHOOTERS.—Washington, D.C., Feb., 10th.

CONGRESSIONAL PIGEON SHOOTERS .- Washington, D.C., Feb. 10th. -A Congressional pigeon match occurred at Brightwood Park, about three miles from this city, last Saturday. Congressmen

Finley, Acklin, Poehler, Robertson, Steele and a few of the Finley, Acklin, Poehler, Robertson, Steele and a 1cw of the friends participated. The weather was raw; a severe wind was blowing directly from the traps, and the ground was covered with snow. A majority of the birds were good filer. Four sweep-stake matches were shot; five birds each; 21 yards rise; \$5 entran fee; 60 per cent, to the first, and 40 per cent, to the accound. Ties were settled at 24 yards rise. In the first match, three birds each were allowed to settle ties. In the other matches, miss and out was the rule. The following was the score:—

| FIRST MATCH. |
|---|
| $\begin{array}{c ccccccccccccccccccccccccccccccccccc$ |
| Wagner won first money. Mills won second money by killing two out of three birds. |
| SECOND MATCH. |
| $\begin{array}{llllllllllllllllllllllllllllllllllll$ |
| Mills and Wagner divided first money. Acklin beat Barker one bird in shooting off the tie, and took second money. |
| THIRD MATCH. |
| Finley |
| Acklin won first, and Wagner and Poehler divided second |
| FOURTH MATCH. |
| Finley |
| In shooting off the ties Acklin killed four straight birds, and won first money. Mr. Finley killed three birds, and took second |
| money. C. M. Ogden acted as score-keeper and referee. |

RANGE AND GALLERY.

MASSACHUSETTS-Boston, Fob. 7th.-Walnut Hill, to-day, presented a wintry appearance. The snow between the pavilion and the largets produced a glare in the early shooting which troubled the targets produced a gate in the early shooting which troubed the marksmen. The light, however, was of the best, and the which gave no trouble, showing upon the dial 5 clock, and coming from the east. The attendance was large, executify entries beling made. The speciators also were numerous, among whom was Mr. Russell, of the Holyoka Riffe Club. In the aftermoon the wather consoil, of the harrysox into the the theorem of the weather con-ditions the harrysox have been a present and the shooting was been in a blinding snow-storm, but better shooting has never been done at Wahuth a mili-range. Mr. Charles heads the list against all conners with a mili-tary rill or with 47, and two points added for a handicap, giving the rill, with 48, under the same conditions. With the sporting rille brillinit work was done, as the summary indicates:—

The members of the New Orleans Rifle Club have determined to meet every week, and if it lies in their power they will revive rifle shooting in this city.

FANCY SHOOTING—There is another doctor in the field, and this is how the Kingston (Can.) Whis tells of his doing.—"Dr. Knightwith a long Winchester repeating ridle, began at 230 yards and made ten straight built-seves; position, standing; size of built-seve, six inches in diameter. Then fring 500 yards, built-seye fourteen inches in diameter, lene ning 500 yards, built-seye fourteen inches in diameter, lene made fifteen built-seyes out of sixteen shots. After having a warm, as the weather was very cold, the Doctor displayed his short-range Winchester sporting ridle, doing some wonderful shooting. First he took the pipes from the mouth of a friend at fifty yards, breaking six in succession, the length of the stems of the pipes being four inches; then he shot six fitty-cent pieces, held between the thumb and finger, at forty yards' distance. This was done without a miss. The Doctor finished bitting twenty-two apples out of twenty four, thrown into the air by the band, as glass balls and trap were not to be had in Kingston. The Doctor is confident that he can break interty-five glass balls out of one bundred. At last he filled the FANCY SHOOTING-There is another doctor in the field, and this ninety-five glass bulls out of one hundred. At last he filled the magazine of his Winchester rifle (sixteen cartridges) and discharged the whole at a bull's-eye eighteen inches in diameter, distance 100 yards, in the short space of just thirty seconds.

WHAT A HUNTER THINKS.

SAN ANTONIA TOY Editor Forest and Stream :

I have from time to time been much interested in the discus-I have from time to time been much interested in the discussion as to what was the best sporting rile, and my observations have been quite extensive, and, to me, resulted very satisfactorily. For game no large than deer, hear and pandher, my conclusions are that there is nothing equal to a Winchester. At cal. Here in Texas, especially the vestern portion of the State, where deer are killed every whiter by the thousands, one has a pretty fair opportunity to observe what riles are the most used, and with what effect. I have seen almost every make of rile used, but by all, or nearly all, professional hunters the preference is given to the Winchester, At, '3' amodel.

Now, as to Express builtets and large caliber, 1 think much of the talk to be nonsense or a waste of breath, at least so far us

Now, as to Express bullets and large caliber, 1 think much of the talk to be nousense or a waste of breath, at least so far as the larger bore is concerned. The killing force of a ball depends more on its power of penetration or striking force than size—that's my opinion, at least, and that is formed from observation. A.ii Winchesier will go clear through a Tevas deer from ead to end, and that is all any gran could do. To illustrate: While on a bunt in November in the mountains in Northwest Texas, on a bear hunt, old brein was shot through and through with a 55 Needle gun, yet he kept up his pace until another party rushed him. Now, the hole or opening made by the Needle gun was much larger than the revolver ball had made, yet was not so effective. Why? Simply because it was not so well piaced; and permit me to say that that is simply the whole scere. A correct errective. Why? simply because it was not so wen parcer; and permit me to say that that is simply the whole secret. A correct or accurate showing gun, well almed, and of .4 cat., will do the work just as well, and not be so disastrous to the shoulder of the shotout. The had enough of your kickers.

Now, I wish to say something about deer running. I have seen

a deer, with his heart tora to linters by different calliber balls, run from one to five hundred yards; while had the same ball struck the spine the game would have been instantly down. I don't consider an Expres or Explosive ball any more fatal than

Why? Simply because the explosion takes a 41 Winchestor. a 34 whomester. Why? simply occause the explosion takes place at the surface or near the surface, and not only retards the force of the ball, but gives it less killing power. I say let us have more practical and less theoretical talk, and you can get hundreds of practical hunters here on our border to restify to what I say.

I will give an instance that occurred to me in November last One morning early, just as soon as it began to break day, I started out after deer, and had gone about a quarter of a mile from camp, when I came upon a bunch of seven or eight deer. which were about 159 yards from me, and took deliberate aim on fine, large doe and fires. I heard the ball strike very plain'y a fine, large doe and fires. I heard the ball strike very My aim was to put the ball in at point of shoulder, as I stood quartering to me, exposing the right shoulder. afterward the shot had been true to my aim. The ball just in front of right fore-shoulder, and came out just behind the left shoulder. You see the course of the ball was quartering left shoulder. You see the course of the one was quantering through, and severed the north artery, close to the base of lung and ranging very close to the heart. Now, this is generally con-sidered a very fatul shot, yet the doe made two jumps, then fell or lay down. On my approach she jumped up and ran up a hill or lay down. On tay approach she jumped up that tan up a no-a bundred yards, then lying down. Lagain approached cautiously. but being brushly and stony ground she again took the alarm and ran over a hundred yards further. This time I gave hermore time, and approached her more cautiously, and as her breating was very distinct—I being able to hear the blood gush from the wound with every breath—it was easy to follow. I had got within twenty five or thirty yards before she choked with blood. The twenty are or turry yards nector she cooked with blood. The hungs were completely filled with blood. Dr. Gray, of Chicago, who was one of the party, and myself, made a very thorough autopsy, so I know of what [write. Now, an Express ball or a ball of large caliber could not have made—following the same a more severe and fatal wound. I saw at first the shot was course—a more severe and time woulds. I saw at irist the shot was fatal, and as I had a desire to see what length of time she would live and the ability of speed, I didn't attempt to shoot her again. I have seen dozens of deer shot through the heart, and that organ rendered almost into fragments, and do not think one of them. ver dropped in their tracks, and most of them ran over a hun

say I prefer the Winchester rifle for sporting purposes to any I say I prefer the Winchester rifle for sporting purposes to any other. My reasons are: First, you have, as I us a 28-inch eotogan barrel, sixteen charges in reserve, which can be rapidly used. Then they are very accurate in aim, and do not affect a nervous person by the heavy recoil that the Tgr. power, 429 gr. ball do. In fact, the Winchester A4 cal. rifle I consider by Iar the most

do, in fact, the windlester A call fine I consider by far the most practical sporting rifle.

I think Mr. W. Rabbeth and a correspondent from St. Louis who subscribes himself "Hunting Rifle," on the wrong track. I who subscribes himself "Hunting Rifle," on the wrong truck. I speak from experience. I tried that line until I got freed. More deer are shot inside of a hundred yards than over that distance. Occasionally one is shot two, three, or four, or even six hundred yards, but here in Western Texas, at least, where deer are only still-hunted, there are very few shot over 100 yards, or 150 at most, and at that distance I find the rifle I speak of the most accurate. I groped about in the dark for several years, and I give my experience thinking (t might be of use to some brother sportsmen. I can safely say to W. B. D. Gray that the Winchester, .44 cal., 28 octagon barrel sporting rifle is a accurate as any sporting rifle up to four or five hundred yards, and I dare say he will never

have occasion to shoot at game at a greater distance.

Men who make a business of killing game for a living certainly adopt the best gun, or what they think the best, and nine out of ten of these men use the Winehester.

For fear some may suspect this as a paid-for article, I will say I wer had even as much as a cartridge of the Winchester Arr mpany that I didn't pay for, and I have never had a word rrespondence or otherwise with any member of the compan

SHELLS THAT DO NOT STICK.—Toledo, Ohio, [Feb. 1st.—Editor Forest and Stream:—My experience with mid-range 40 and Creedmoor 44 Ballard shells has been, for the first few times shooting. perhaps 15 per cent, of the shells to expand, so as to cause trouble

perhaps 15 per cent. of the shells to expand, so as to cause (rouble, but never have I failled to remedy it for good.

I think the trouble is that a portion of the shells are soft, and others at a spring temper; and when they have been used long enough for the soft ones to, become hardened (which they always do by use), then by chucking them on a lathe, and with a little emery paper jeut them until they fit perfectly, there will be no emory paper out them until they be perfectly, there will be no further trouble, provided that the shells are properly cleaned and the balls not driven into the shells. I have seen shells wholly spoiled by not cleaning and then forcing a modded ball (half-inch) into them.

There is one thing which is unaccountable to me, and that is my. 44 shells, or part of them, contract at the mouth when shot, and will not receive the same style of ball without being rimmed out. Will some one give the cause?

Fast Boston, Feb. 6th .- Editor Forest and Stream :- After hearing Edst. Boston, Feb., oin.—Editor Forest and Stream:—After hearing silently my favorite rifle and shell attacked by strangers—few and far apart it is true, but nevertheless adversely criticised in the Foresz and Stream to the effect that the shell styled "Everlasting" expands to an extent which renders it useless after a few is the state of th nor with the rifle if it was cleaned; and further, this is not only my experience, but I have never heard a word of complaint my experience, but I have never heard a word of complaint signifies the Everlasting skill of itsiliard rills during it be two years I have been a member of two prominent Massachusetts chibs. It will be at once seen, a tirm turning out thousands of rifice every year, that there will necessarily a few imperfect rifics get into the murket. The imperfections of a rifle will first show themselves in that part which is most in use, and as the shell has to confe its surface every time the rifle is shot to the surface of the cha its currace every time the rine is snot to the surface of the cham-ber, the honest cause for complaint, if any, will be found in the chamber of the rille, and not in the shell. It one orders a rille of a manufacturer and finds it is imperfect, his first impulse is to send it back where it came from, have it remedied, and returned free of expense before publishing a criticism on shell or rife of whose "means" the average shooters know so little, however well posted he may be regarding effects.

Archern.

NATIONAL ARCHERY ASSOCIATION.

A T noon on the 28th day of January, 1880, at the Paimer House in Chicago, the annualbusinessmeeting of the National Archery Association was called to order. In the absence of the President, Mr. Frank Sidway, of the Buffalo Toyophilites, was called to the Mr. Frank Suway, of the Bullato Toxophilities, was called to the chart, the Corresponding Secretary, Henry C. Carver, Esq., acting as Secretary for the meeting. A letter was read from the President, Hon. Maurice Thompson, which was received and ordered published in the organ of the association, the Poinser AND STREAM, The minutes of the last meeting, which was held at Crawfords. The minutes of the last meeting which was held at Crawfords-ville, Ind., Jan. 234, 1879, were read and approved. The report of the Recording Secretary was read and approved and ordered to be published in the Forest and Stream. The Corresponding Secretary having acted as Treasurer, his report was accepted as Treasurer also. The report of the Executive Commuttee was re-Pressure also, in a report of the Exceeding Committee was re-ceived and ordered placed on file. The delegates then proceeded to discuss the propriety of amending the constitution in several particulars. On motion of Frank Sidway, Esq., it was resolved to amend article 4 of the constitution by striking out the words "fourth Wednesday of January in each year at 13 o'clock M.," and substitute therefor the words "Monday next preceding the grand sansitude therefor the words - Amondy next proceeding the grand annual meeting at 12 o clock M." Upon motion of Mr. Edward Brewster it was resolved to amend

Article 6 of the constitution by adding the words, "Each society shall pay to the Corresponding Secretary on or before June 1st in snau pay to the corresponding secretary on or before June 1st in each year, as annual dues, a sum equal to \$\forall for each term, as annual dues, a sum equal to \$\forall for each term annual meeting unless the dues of his or her society shall have been paid as above. Each archer entering the competition for prizes at the result annual medius shall now an entrange for \$\tilde{\times}\$ is grand annual meeting shall pay an entrance fee of \$5.

Thom motion of Henry C. Carver, Esq., it was resolved to strike out all of article 7 of the const tution which follows the words 'voluntary withdrawal of societies.' The following resolution was introduced by Henry C. Carver, Esq., and carried by a unanimous vote:

Whereas, It having been found necessary for the success of the Whereas, it having been touton necessary for the success of the first grand annual meeting of the National Archery Association that a confingent guaranty fund be prepared against loss to the Executive Committee in the conduct of said meeting, and in pursuance whereof a written instrument of guaranty was prepared suance whereof a written instrument of guaranty was prepared and executed by the signatures of many generous archers and patrons of archery throughout the United States, and whereas by the excess of expenditures of said meeting over the receipts, the-came necessary to assess against each and overy gulseriber to said guaranty fund the sum of thirty-reight (38) ner cent, of the amount by him subscribed; and, whereas, the Kokomo Archers, and the subscribed to the date guarantee of a theory of the sum of the said guarantee. amount by min subsertion; min, whereas, inc. Armers, or Kokomo, Indiana, subserbed to said guaranty fund the sun of \$800, and pledged themselves in honor to pay their proportionate part of the aforesaid loss, and whereas, upon presentation of their proper assessment, they utterly refused to fulfil their pledge. to pay their assessment or any part thereof. Therefore, Be it resolved, that because of the wanton breach of their plighted resolved, that because of the wanton freach of their physics faith, which between gentlemen and brethren in any cause should ever be held sacred, the said Kokomo Archers are hereby expelled forever from the National Archery Association; that the Recording Secretary is hereby ordered to expunge their names from the ing secretary is nervely ordered to expense their names from the roll of societies of the association, and that this resolution be published in the Forder and Strugan. Upon motion of H. C. Carver, Esq., it was resolved to amend Article V. of the constitution by striking out the words "from

the delegates present." on motion of Will H. Thompson, Esq., it was resolved to

Upon motion of Will 1. Thompson, ESG, It Was resolved to hold the second grand annual meeting of the National Archery Association at the Gity of Buffalo, N. Y., on Tuesday, Wednesday and Thursday, the 13th, 14th and 15th days of July, 1889.

Upon the motion of Henry C. Carver, Esg, a vote of thanks was tendered to the retiring President the Hon. Maurice Thompson

was tendered to the returning Fresanch. The flow statute 1 hollo-son, for the valuable services rendered by him to the association during the year of his Presidency, and atthough to declined to allow his name to be further used in connection with that office on account of the press of other labors, it is earnestly hoped that he may often give to the association the benefit of his encouraged advice.

The following officers were then chosen by unanimous vote, to

The following omers were then emosen by unanimous vote, to erve until the next annual business meeting:— President—Henry C. Carver, Highland Park Archers. First Vice-President—Frank Sidway, Buffalo Toxophilites. Seemed Vice-President—Major A. G. Constable, Brooklyn Arch-

ers.

Third Vice-President—E. P. Chester, Commodus Archers,
Recording Secretary—D. V. R. Mantey, Toledo Archers,
Corresponding Secretary—E. B. Smith, Buffalo Toxophilites,
Treasurra—E. B. Smith, Buffalo Toxophilites.

Freentive Committee-Samuel S. Spaulding, Buffalo: E. B. Smith Executive Committee—Samuel 8, Spanning, domalo [2, L. S. Shith, Bluffalo ; Dohn B. Sage, Huffalo ; Funk Sidway, Huffalo ; S. E. Engan, Chicago; Will H. Thompson, Crawfordsville. Upon motion the association adjourned to meet at the Palace Hotel, at Buffalo, N. V., on Tuesday, Ju y 13th."
FRANK SIDWAY, President pro tem.

HENRY C. CARVER, Secretary.

Mr. Carver's Report.

Mr. President and Delegates of the National Archery Association: -The time appointed by the National Archery Association under its Constitution for the holding of its inaugural business meeting having now arrived, I have the honor to submit a brief resume of the year's accumulation of facts and incidents in the history of the years accumulation or taken and measures in the history of archery, as formed and directed by the National Archery Association of the United States. Late in the fall of IsIs, a few gentlemen archers, realizing the necessity of a confederation of clubs under one general unangement, and of giving national life and strength to so pure and fascinating a recreation as urchery, agitated the subject of calling a Convention for the purpose of permanent national organization. All of the prominent clubs throughmanent national organization. All of the prominent clubs throughout the country, with one accord, indorsed this movement and united upon Crawfordsville, had, (the accredited home of an-eters) as the fitting place for holding such Convention. Accordingly, the meeting was called for January 233, 189, at Mayor John W. Ramsny's office in Crawfordsville, and there, at the apointed time, the foundation stone of archery in America was hid, pointed time, the foundation stone of archery in America was hieldeep and fin, and tree, and has been builded upon, and the substructure is now a superstructure, and it is the bounden duty of every member identified with the Association to see that the work of building goes on until the edifice is completed. Of archery it may well be said (what can scarcely be said or other national sports), that it offers no temptingly dark conners where rascalty can lade, and nover has shown any painful and startling discipance of personal profligacy or corruption; but we may boast of it as possessing attractions that call together ladies and gentle men of a high order of intelligence. It is distinctive and exclusive in its domains upon recreative amounts, and it is the other this meeting to so order its deliberations and enactments preserve and perpetuate the high character of the pastime it is convened to regulate and honor. deliberations and enactments as to

The report of the inaugural proceedings at Crawfordsville I have been to read. ** * * * The Constitution of the Association now neg to read. The Constitution of the Association having been carefully prepared and reviewed by the Committee appointed, it was handed over to the Secretary, who ordered two hundred copies printed and mailed to the different archery clubs in the States, and, in the few months preceding the grand inau-gural meeting, the Association added to its membership eight so-cleties, and on August 1st the roll-call of members was as follows:

Wubash Merry Bowmen, Crawfordsvill, Ind. Kokomo Archers, Kokomo, Ind. Des Moines Toxophilites, Des Moines, Iowa. Des Monies Toxophilites, Bos Monies, Iowa, Highland Park Archeres, Highland Park, Ill. Chicago Archery Association, Chicago, North Side Archery Club, Batavia Archery, Batavia, Buffalo Toxophilites, Buffalo, N. Y. Brooklyn Archery Club, Brooklyn, N. Y. Robin Hood Archery Club, De Pere, Wis. Arden Archers, Marietta, Ohio. Toledo Archery Club, Toledo, Ohio. Cresent Howmen, Charlotte, Mich. Hastings Archery Club, Hastings, Mich. Commodus Archers, Lawrence, Kans.

This list shows that the National Archery Association, of the This also and the training of existence, counted its membership from representative clubs scattered over eight States, which is a flourishing exhibit—all things considered. In addition to the intent of our Association to centralize and form laws for the general government of archery societies, it also provided and ening of its members for competitive shooting for Association and private prizes, as per Article 8th of the Constitution. The first private prizes, as per Article still of the Constitution. The uncetting was appointed to take place in Chicago, and confithrough the three days, from August 12th to 14th, inclusive. through the three days from a days and a series a programme members of the Committee delegated to prepare a programme and order the arrangement of prizes, worked faithfully, patiently, and conscientiously at the very difficult task assigned them, and they congratulated themselves upon its completion, that they had molded well their work; yet, at the conclusion of the grand meeting, this Programme Committee discovered that it had made meeting, this Programme Committee also vered that it had make many grave mistakes, which, in view of its having had no antecedent experience to build upon, was generously condoned by the archery public. That the first grand annual meeting was a great s (in those elements of geniality, harmony, and interest. success (in those elements of genanty, narmony, and interest, which constitute genuine success), has been admitted by all those who witnessed, and the archers who participated in, its festivities. The attendance of archers was most encouragingly large for a first meeting -twenty ladies and fifty-four gentlemen computing for the many and valuable prizes offered. The Championess and Champion Medals were won with respective scores of 541 and 621. Let use compare our champion's score at this first national meeting. Champion Medals were won with respective scores of 3if and 621. Let us compare our champion's score at this first national meeting, with the results of the first five years of the English grand national meetings. Their initial gathering of archers was held at York in 1844, with no lady, and sixty-five gentlemen competitors, the Champion Medal having been won with a score equal to 442. Their second meeting (1849) at York: Competitors—II laddes: 110 gentlemen; highest score, 537. Third meeting (1846), also held at York: 33 gentlemen competitors; no ladies; champion's score, 539. Fourth meeting (1847), at Derby: 6 hadies; 58 gentlemen; medal won by vetran Peter Muir, of Edinburgh, with a score of 31. Firth meeting (1818), at Derby: 5 ladies; 74 gentlemen; champion's score, 581. Thus, through a period of five years, the English champion's score, on the Double York Round, but once medal won by veteran Peter Muir, of Edinburgh, with a score of 631. Firth meeting (1818), at Derby: 5 ladies; 74 gentlemen; clampion's score, 581. Thus, through a period of five years, the English champion's score, on the Double York Round, but once exceeded the greatest score made at our first meeting, and that by but seven points only, while the gross hits of our champion were 17210 Mr. Minis 183; while not until the eighth year of its existence as a national organization, could the English Grand National boast of so great a number of lady emissiants as our record shows for its opening ovent. Hence, if comparisons can horeuse and strengthen hope and zeal, we have assuredly feel energized and encouraged in our good work.

Increase and strengthen hope and zeal, we may assuredly feel energized and encouraged in our good work.

In preparing for the inaugural meeting the detail of work was varied and complicated, and your Exceutive Board in reviewing the event would suggest to the newly-elected committee that much confusion and unnecessary labor and delay may be avoided by eare in the arrangement of sun improved system of scoring. Your Committee plead guilty to having under-estimated the importance of this very important feature in preparing for the met ting of August last, and so loosely kept and confused were the score sheets, that it required many days of hard work to straighten and confuse. paring for the meeting of Auguss may personal for the meeting of Auguss may personal for the score sheets, that it required many days of bard work to straighten and confirm them. The light of last year's experience will be valuable to us in preparing for the second Grand Meeting, and let us take due counsel from its lessons, that we may have a perfect programme this year, Justly and wisely distributing prizes, a perfect order of shooting, with no littless or discords; a perfect plan of secring, that shall show correct aggregate scores at the completion of each dozen arrows. hitches or discorted, the completion of each dozen as correct aggregate scores at the completion of each dozen as Let us have harmony, enthusiasm and perpetual good checked because our second Grand Annual. A little care and the completion of the completion memory to the completion of each dozen as the completion of eac through our second Grand Annual. A little care and fore thought will insure this, and it will be a pleasant memory to us all

thought will insure this, and it win one pressure memory rows and nembodying and submitting to your my report as Corresponding Sceretary, I beg to state that by force of circumstances the duties of Treasurer also ratelly and coercively devoted upon me I was obliged to become personally responsible for necessary printing and stationery bills, and to advance the money requires crinting and stationery bills, and to advance the money required to pay such bills, and to carry on the work of the Association My account as Treasurer shows receipts from initiation fees \$150 My account as Treasurer snows receipts from initiation fees \$150. Disbursements:—Duties and charges on prizes from England, \$17.91; stationery, printing and stamps, \$105.10; total, \$153.04.

SIGM; stationery, printing and stamps, 510-01; total. St53.09. In view of the necessarily large outlays incumbent upon the Executive Committee in completing preparations for the first grand annual meeting, it was deemed necessary to raise a contingent fund, in order that the burden of expense might be equitably shared. A decument was accordingly drafted and circulated-and subscriptions received to the aggregate amount of \$3,700. At the conclusion of the Aurust meeting a statement of receivers and subscriptions received to the aggregate amount of \$3,700. At the conclusion of the August meeting a statement of receipts and expenditures incurred was prepared by myself, and a copy submitted to each guarantor, showing the gross receipts to have been \$1,00.07, and the expenses \$2,107.74, leaving a deficit of \$1,201.07 -necessitating an assessment of thirty-eight per cent. upon each guarantor's subscription in order to pay all debts and the business. Every superprise phospitally and swengish beautiful parts. upon each guarantor's subscription in order to pay all debts and asb prizes. Every guarantor cheerfully and promptly honored there cosment, with the single exception of the Kokomo Archers, who had subscribed \$800 to the fund. This club, as a body, reused to satisfy their pledge, which they should have held serent. The amount of their defalcation, however, was paid into the treasury by tour individual members of other clubs, enabling me

pay every cash prize and every claim in full. Thus the integrity and good faith of the Association in this, its first year of life has been sacredly preserved; and I congratulate you, gentlemen upon the stability with which your Association enters upon its upon the stability with which your Association of the second year of existence, and by united persoverence and fidelit on your part, it shall become national in character and interes as it is now in name.

Henry C. Carver.

PRIVATE PRACTICE CLUB.

A FTER the adjournment of the business meeting of the National Archery Association, which was held at Chicago, on the 28th day of January, the archers there ussembled as delegates formed and adopted the constitution and rules of a Private Practice Club. The vast advantages of such a society to both the members and the mass of archers in general can be seen at a glance. ners and the mass of utforms generat varieties to generate Practice will be reduced to a system. Every arrow shot will be carefully delivered, because the shooter will know that his average score depends upon each shot. Every archer will see in the mouthly reports of the Secretary the true measure of the skill of different archers, a thing unknown before, as all archers only pub lished their best scores, and now all will be reported. Scores of lished their best scores, and now an will be reported. Scores of 100 and 120 with twonly-four arrows at sixty yards will now appear attached to some names and in close company with scores by the same rarchers of sixty to seventy-five points. This is us it should be, It is not the exceptional scores which should be printed, but the average scores. The Private Practice Club will printed, but the average scores. The Private Practice Club will do more for archery in this country than any other organization except the Grand National Association, and will do much to make the tourneys of that association a success. Every archer in the country who hopes to attain to a high position in archery should at once attach himself to the Private Practice Club. The club. once attach missert of the Thate Thate Citis. The onloceted the following officers:—
President—E. T. Church, Charlotte, Mich.
Piee-President—Edwin B. Chester, Lawrence, Kansas.
Secretary and Treasurer—Will H. Thompson, Crawfords ville, Ind-

Secretary and Treasurer—Will H. Thompson, trawtordswile, Ind-The first senson of practice will be a short one, running outy until the annual meeting at Buffalo on the second Tuesday in July next, therefore all archers who desire to become members should apply to the Secretary at once. The Secretary will send to the President of every society known to him a copy of the Eas-NO STREAM containing the constitution and rules, and begs EST AND STREAM containing the constitution and rules, and ocas of such persons receiving papers to call the attention of members of their societies to the importance of making early applications for admission to the club. The English archers two years ago formed such a private practice club, and the archery editor of the don Field declares that the archers of Great Britain owe more London Field declares that the declares of wheth Danish when the fit than any other organization for the rapid advancement made by the mass of British archers in the past two years. By the classing of archers the advantage of the expert over the beginner begir is curtailed and an opportunity given to all to gain a prize. is curtailed and an opportunity given to all to gain a prize. Even in the classes the prizes are so arranged as to make uncertain the success of those scoring highest. For instance, in each class the archer who averages best at the whole York Rouni's shot will get first prize. The same archer may also average best at each of the ranges, but he is barred from taking another prize. The number making the highest single round gets the second prize. He may re well at any of the ranges, or only at one of them not average well at any of the ranges, or only at one of them. So as to the three other prizes. Now as to the class into which the archer should place himself we can only say, "aim high." The Secretary, after much consultation with the leading archers of Secretary, after much consultation with the leading archers of the country, would suggest that the classification should be made about thus:—Each archer who feels that he is reliable for an average score of sixty points with twenty-four arrows at sixty yards should attach himself to the Class I. Those averaging less than sixty and more than fifty points, Class III. Less than forty points, Class IV. Of course no class can be composed only of archers of exactly the same degree of skill, only approximately so. Some may imagine that all the grading is put low, but the most careful examination of records will show that an average in both public and private shooting of sixty points with twenty-fourgarrows at sixty yards is good work for an archer with twenty-four arrows at sixty yards is good work for an archer with twenty-four introvace say, you say on a make such an are range should unbestiatingly enter the first class. At the annual meeting in July the classification will, without doubt, be rearranged in accordance with the proved skill of the members. The ranger in account once, upon joining the club, begin a careful detail record of their shooting at the ranges of the York Round, and the Secretary will furnish blanks upon which the scores may be reported to him.

By the constitution and rules a member may practice at range of fifty yards and under, and at ranges of 120 yards and over, a of litty yards and under, and a ranges of Le Yards and over, a his pleasure; but each and overy arrow shot at any of the range of the York Round must be reported, so that the club will know precisely the average skill of each member. The monthly report of the Secretary will appear in the FOREST AND STREAM about the 10th of each month, giving the details of the shooting of each the 10th of enden month, giving the vectors of the showing of sector member for the past month, and will be wartehed for anxiously by all earnest archers. The object of forbidding any shooting at any ranges longer than 11th y ards and shorter than 12b yards was to prevent a member practising at such approximate distances as would give him an undue advantage; say at sixty-one yards. seventy-nine yards, and ninety-nine yards. The perfect fairnes seventy-nine yards, and inney-nine yards. Inceperior inness of the plan commends itself to all fair-minded persons. Hurry in the names. Let us have two hundred members by March Ist. Already a large number of leading archers have Joined. The first monthly report of the Secretary for the half of February, beginning on the 15th ipst, will appear in the Forssex AND STREAM OR ning on the 18th 18th, will algorithm the Process Asia Published
the 11th day of March, and although the membership will nece
sarily be small at that time and the scores few, because of it
wintry weather, a start will be made. WILL H. THOMPSON,
Secretary Private Practice Club.

CONSTITUTION AND RULES OF THE PRIVATE PRACTICE CLUB.

I. This Society shall be called the Private Practice Club. 1. This society shall be caused the Firwage Fractice data.

II. It shall be the object of this Society to encourage the systematic practice of the pastime of archery at the ranges of the York Round and by every effort to promote the skill of each

HII. The membership of this Society shall consist of such gentle archers in good standing in the United States of America as men archers in good standing in the Omerotace, shall make application, in writing, to the Socretary of their desire to become members, indicating in said letter the class to which each desires to be attached, and paying to said Secretary in admission fee of one dollar.

IV. The officers of the Private Practice Club shall be a Presi-Vice-President, and a Secretary, who shall be ex official

Treasurer.

V. It shall be the duty of the President (and in his absence. Vice-President) to preside at the meetings of the Club, to and places as shall be necessary, to present to the members entitled thereto the prizes awarded to them, and to perform such other duties as usually devolve upon the executive officer of a society.

VI It shall be the duty of the Secretary to keep a record of all the doings of the Club in a book by him kept, and to receive and duly account for all moneys and property of the Club. He shall keep a detail record of the scores made by each member, and reported to him, showing in said record the class to which each member belongs, the date of each score shot, and the hits and value of each score at each range. He shall at the end of every month make out a detail report of the doings of the Club, and forward the same to the organ of the Club for publication. each annual meeting of the Chib he shall present a complete re each annual meeting of the Chib he shall present a complete re-port of the doings of the Chib for the preceding year, showing the whole number of York Rounds, and parts of Rounds, shot by each member, the average score, the average hits, and the high-est single round, and the average score at each range made by each member of the Club; and upon said report the prizes shall be awarded and paid by the President, by an order drawn by him the Secretary. VII. The Club shall hold one annual business meeting at the

VII. The Club shall hold one statual business meeting at the same date and place of the annual business meeting of the National Archery Association, to receive the report of the Secretary and the prize awards of the President, and to transact such other business as shall come before the Club, and shall at such meeting elect officers for the cusuing year.

YIH. The members of the Club shall be divided into four classos, to be known as Class 1. Class 2, Class 3 and Class 4, and the

Club shall offer five cash prizes in each class, as follows :- The ount of the initiation fees received from each class shall whole amount or the immution ties received into fact mass shart be divided into five prizes, the first prize to be twenty-eight per cent, the second prize twenty-four per cent, the third prize twenty per cent, the fourth prize sixteen per cent, and the fifth prize twelve per cent, of the whole sum. The prizes shull be

To the member making the highest average in his class at the single York Round. First Prize. To the member making the highest individual score in his class at the single York Round. Second Prize. yards range. Third Prize.
To the member making the highest average score at the 80 yards range. Fourth Prize.
To the member making the highest average score at the 60

IX. The practice of the members shall consist of the York Round (or some one or more of the ranges thereof), which may be shot through upon any day, except Sunday, and at any place, or any one or more of the ranges may be shot upon one day, and the remainder upon the next orany subsequent day, and at the same or any ether place. Provided, that no trial shots or any inter-mediate practice at any of the ranges of the York Round, or at any range longer than 50 yards, and shorter than 12) yards, shall

X. Since it is not practicable for private practice scores to be al-A. Since it is not practicable for private practice scores to be al-ways attested by a witness, it is permitted each member, upon his own personal honor, to report to the Secretary his own scores, and any member who shall be found to have made a false report shall be expelled from the Club, shall lose all place in the s shart peexpensed from the court, shart lose an index at the score lists, and the Secretary shall cause a report of such act to be published in the organ of the Club.

XI. On the first day of each month the shooter shall forward to

the Secretary a detailed report of every score shot by him at any of the ranges of the York Round, giving the date and place where each score was shot, and the hits and score at each range, and the each score was shot, and the first and score at each r. Secretary shall record the same to his credit. The required to shoot all the ranges of the York Ro shoot only the range or ranges he may desire, and such range or ranges shall be counted, and considered in the such range or ranges shall be counted, and considered in the award of prize for said range or ranges. And if a number shall shoot the York Round, and shall also shoot an excess of scores at one or more of the ranges, the said excess shall be considered in awarding prizes for said range or ranges. But each and every arrow shot attany of said nanges attany thus or place must be duly reported, whether shot in private, in a match, or at a public

XII. In awarding prizes, a tie in score shall be decided by hits. XII. In awarding prizes, a tie in score shall be decided by hits, and in case of a tie in both hits and score, the amount of the prize shall be equally divided between the members so tied.

XIII. In addition to the prizes offered by the Club, any member

making three golds at an end at any of the ranges of the York making three golds at an end at any of the ranges of the York Round, at the grand annual meeting of the National Archery As-sociation, shall receive from every member of the Club, whether present or not, the sum of twonty-five cents. XIV. Any special prizes offered by members or patrons of the Club shall be awarded upon the conditions fixed by the donor, regardless of the result of the competition for the cash prizes

awarded by the Club.

YACHTING NEWS.

DESIGNING YACRES, -We call attention to the card of Mr. A. Cary Smith, to be found in another column. Mr. Smith has designed so many successful yachts that any praise of his work here would be superfluous. He has achieved in the Intrepid what is as rare as remarkable-a perfect combination of seagoing and cruising qualities of the highest degree, with racing capabilities of no mean order. As a matter of record the schooner Introvid stands to-day the most successful combination of all-round qualities to be found in America.

Town Cops .- Says the Boston Herald, very truly :- "It is suggested by many persons interested both in rowing and yachting that the city should be more liberal with the pleasure sailors next Fourth of July than heretofore; that prizes sufficiently valuable to attract the best yachts in the country be offered, and that a to acting the sees years in a country be observed, and make a sailing regart a grander in preportions than any yed witnessed in these waters be arranged. Whatever is worth doing at all is worth doing well, and if the yachtsmen will only make half an effort, and not let the arrangements for the Fourth of July Itgatta go by default, they can have just such a regatta as is suggeated. People have tired of seeing the same yachts sail against each other at every regatta, and a little novelty next year would be the proper thing. Indecondent of the city's purses, a citizen's grand prize for all yachts could doubtless be procured with a lit-

We wonder if the City Fathers of New York will ever be anutical enough to devote a portion of the maintiplan appropria-flors for the Fourni of July to yacht matches for craft of all tonnages, from the big schooners down to the open boat. There are both less useful and less popular methods of sper ding public funds in yogue.

THE CABIN LOCKER-Marine Gluc.-Glue, twelve parts: water

enough to dissolve; add vellow resin, three parst; and when l add turpentine, four parts. To polish woodwork, with pumice-stone and water till smooth, then polish melted add bright surface with powdered tripoli and li-Motive Power.-From practice this rule has been deduced: Sading vessel having a length six times that of her breadth requires for a speed of ten knots per hour an impelling force of 48 pounds per square foot of immersed section if the ship is of normal shane.

QUAKER CITY VACHT CLUB -Many new boots, including cabin turn affairs have taken looking to the permanent establishment of real vachting in their waters.

THE COMING.-Every one knows this sloop and her enviable THE COMING.—Every one knows this snoop and nev chamber record as a fast rucer. The recent gales nearly made match-wood of her, and it is only too likely that her skipper and crew of two men have been lost by trusting their fate to a larger vessel which went ashore in the same gale, and was complotely wreched a fl Easton's Neek, f. i. The Conding belongs to Me. Stephen Peabody, and was the latest addition to the growing fleet of the pros perous Atlantic Y. C. She had been "ordered round "from New Lendon to New York by tow, her owner destring to have her put in commission at an early date, The tug left the Thames Peb.; with the brig *Quischorough* and the yacht in tow. During the night a northeast gale overtook them, and the tug was obliged to round to with her tow for safety off the Thimbies. The yaelth then broke adrift, and the brig soon followed sut. The latter went ashere off Northport, and all hands were lost. The Coming was sighted four days later off Southold, and a fisherman put off to her and anchored her. The next day her owner had the sloot taken around to Greenport to reilt. As both anchors were on the taken around to Greenport to French. As both anchors were on the bows and the boats at the daylis, it became ovident that her crew had not made any attempt to suy by their/vessel and trust to the ground tackle, but had sought other means of safety. The chafe and marks of collision on one sale also seemed to indicate that and marks of collision on one, sac also seemed to indicate that the yacit had been laid alongside of a larger vessel, from which the conclusion vinstreached that Capt. Germanne, his brother and deck, and had bearded the Gilishormagh, and met their death with the latter's crew. At thus of writing nothing has yet been heard of them. The Combig hearted way her spars, you been nearn or them. Into conting parties away her spars ripped her jib, and had some damage done to her deck littings otherwise sac seems to be in fair enough condition after th pounding she underwent on the beach. Sac was built'sy Pollo in 1888 for Mr. Nichols from a model by "Bob" Pish, and is \$21 Fish, and is 6211 If 1989 or N. Auciois from a mouci of "Doo" rish, that is cart fellin, on deek, 57t, w. k., 20t, beam and 5tt.5in, deep, She was sub-sequently and to Mr. H. H. Far, of Boston, then became the prop-erty of Mr. Samuel P. Baqien; reappearing in Now York water-again, was once more sold to Mr. G. G. Haven, N. Y. Y. C., and acquired only quite recently by Mr. Peabody, for Brooklyn, T. ns almost incredible that such a flagrant case of wrecks could occur within the confined limits of the Sound, and it is to be regretted that full information will not be forthcoming unless regretted that full information will not be forthcoming unle some of the unfortunate crow supposed to be drowned should y turn un.

THE RUNAWAY.-This fast little steam yacht has been bought b Arm I Coan at This less interested year has been object by Mr. E. A. Buck, of the spirit of the Times, from Mr. Bedden, the latter building a large from s. s. yacht in Choster. Vice-Com. John R. Waller is also reported as having purchased the Fleur de Lis. What the gallant Vice-Commodore wants with two schooners is a mystery.

Exercise Winnings.-Value of prizes sailed for in Britisl exclused with the state of prizes safed for in british waters was for 1855 only \$13,500; in 1556 the maximum was reached amounting to \$67,500, and in 1879, owing to business depressions the figures were \$51,600. In the same year the winnings in Λ mer ien consisted of 6st prizes, with a value in the neighborhood of

THE HENRIETEE.-Mr. Henri Sav is again cruising down the coast in his fine steam yacht Henriotte, a new shaft having been supplied by Malster & Reany, of Baltimore.

A LADY VACHTING. -Mrs. Brassey, giready well known to the literary world, has added to her fame as a writer and acute observer of current affairs in her latest book, entitled "Sunshine server or current affairs in her latest book, entitled "smishing and Storm in the East," published by Longmans, London. In it Mrs. Brassey records her impressions of the places visited during a cruise in the Mediterranean in 1874 and 1878, and portrays life as the found it in Constantinople and the East, and adds in un appendix the approximate expenditures of the cost of a yacht and keeping her in commission.

OSHKOSH YACHT CLUB.—A correspondent writes;—" We ele to have the fastest yachts of their size on the Continent, aware this is a large boast, but we are able and willing to make spondent writes -- We claim We have often enough beaten New York built boats with

NORFOLK AS A YACHTING PORT.—It is rather strange that : little fall and winter cruising should be induiged in by those who have the leisure for a voyage to the southward during the "of" months. With Norfolk as a headquarters, many a line day may be found during fall and winter where anchors may be tripped to advantage for a sail up. Chesapeake Bay, or, with the time at command, for a more extended run down the coast, with, perchance, a visit to the Bornudas. Norfolk has a fine harbor for yachts; no better, in fact, could be made to order. The city supplies water and provisions at very moderate rates. The holding ground in the harbor is good, and the anchorage not too deep, while in the bays and hights any number of yachts can lay in safety, without fear of fouling with the passing traffic. What should commend the place to the New York public [especially is the excellent communication to be lad with Norfolk by way of With Norfolk as a headquarters, many a line day may should commend the place to the New York public [especially is the excellent communication to be lad with Norfolk by way of the Old Dominion stomabilip line. The vessels of this company sail three times a week with clock-work regularity, are always on time, and leave nothing to be desired in the way of comfort and even luxury of the table and sleeping accommodations. and even luxury of the table and steeping accommonations. As trip on the Old Domitina, the Wignesse, Mandadam, or any of the other steamers dying the bosse flag of the 0 · D. Co., becomes a wholesome and delightful younge, devoid of all the borrors of a prolonged trip at sea, owing to the size and timess of the vessels for their words, and passengers may know that their sately as well

for their work, and passengers may know that their states, as were as convenience is intrusted by the company only to officers of the highest qualification as seamen and gentleone. Distance between Norfolk and New York is virtually annihilated for the yachtsman can leave New York one day after business hours and pull aboard bis yacht in Norfolk the afternoon of the hours and pull aboard his yacht in Nortolk the atternion of the most day. Returning, the same time only need be consumed. With his headquarters in Elizabeth River, he's, moreover, within easy reach of Currituck, the game districts of the coast and the Southern interior, all of which other unsurpassed inducements to the devotees of rod and gam. We know that several yachts propose fitting out some than usual, with the intention of passing chilly months of early spring in the more genial latitudes of m n Roads; and we hope that in time the custom of ni-

grating southward will become as much a babit, among vachts the Mediterrance graing southward will become its much a mont among yields-men here as the annual pilgrimage to the Mediterraneau is among our British cousins.

New York Yacht Club.—The annual meeting of this club was

New York Yactt Club.—The annual meeting of this cult was held Feb. 5th at their club rooms, "wenty-seventh street and Madison avonue, "with Commodore S. N. Kane presiding. The Commodore positively declined re-election, as he proposes to be absent in Europe most of the season. The following board was ultimately elected for 1891;—Commodore, Milliam H. Thomas, Rambler schooner; Vice-Commodore, John R. Waller, Dannilles schooner; Reur-Commodore, John R. Waller, Dannilles schooner; Reur-Commodore, James D. Smith, Estella schooner; Secretary, Charles A. Minton; Treasurer, James O. Frouditt. Mensurer, A. Cary Smith; Fleet Surgeon, Alexander M. Fisher, M. D.; Regatta Committee, Daniel T. Worden, Choster Griswold and G. L. Haight; Committee on Admissions, S. Nicholson Kane, John R. Dieberson, E. W. J. Hurst, Robert Center and Charles H. John R. Dickerson, F. W. J. Hurst, Robert Center and Charles Stebblas; House Committee, N. D. White, H. N. Alden, W. Blatch and T. B. Asten. n. F. W. J. Hurst, Robert Center and Charles'H

The committee having the subject in consideration reported in The committee at migrate success to obtain the expenses of same to a "cruising steamer" oxer is on before noticed in these columns. The club, however, disposed of the scheme by voting it down, and the annual regatta was fixed for June 10th upon motion of Com. Dickerson. It is also proposed to offer a pecial prize for first class keel schooners and the usual prizes for special prize for trast cass feet seniorities and the stand prize for keel sloops. It is fortunate for the club that the "revolutionary" intention of abolishing the regatat did not pass, or it would have been years before the club could have regained the loss such an ill-considered step would undoubtedly have indicated upon the an in-considered step would undountedly and embedded upon A. Committee was also appointed—including Messrs. A. Cary Smith, Robert Center and Com. Dickerson—to reconsider the system of measurement in use and to recommend what changes it

ould be desirable to make.

East River Yacht Club.—This is the name of a new club re-EAST RIVER TACHT CRUE-TINS IS the bame of a now cutor re-cently organized at Greenpoint, L. L. with the following officers: Commodore, William Sivaere: Vice-Commodore, Myron Clenart; Secretary, James Genraf; Treusurcr, Edward Gussum; Sergent-at-Arms, James Conway. The necessity for multiplying our small clubs is open to question. A dozon or so of open boats are not enough to constitute a club of strength or linhuence. It would that a consolidation of the smaller clubs is much more d than anything else among the smaller fry to promote

heir interests.

Order.—Com. Voorbis is reported as building an iron steam eatamaran, at Nyack, about 105ft, long,--Jackson & Mathews annarin, at Myrick, about 1862. 1992.— Sackson & Antiews. Greenport, are building a fine sloop yacht for B. F. Dawsor. D., S. Y. C. She is 48'ft, on deck, 17'ft, beam, and 4'ft.3'ft, draft' tibout board. Will be named the 17'hile Acay.——J. O. Brown. Tarrytown, has in hand a sloop 59'ft. long, 17'ft, beam, and 5ft without board. 2m. hold, for Mr. W. W. Thompson, of New York .--Toront parties are about to build a 5-ton cutter, most likely in Cobn Ont.—Herreschoff, of Bristol, is building a s.s. yacht for Graham, of Baltimore, Ske is 120ft long, 10ft beam, and 6 hold, and is to have compound engines. The Herreschoff Management The Herreschoff Manuacturing Company is also busy with several tornedo launches for governments, and with building their coil boilers foreign governments, and with building their con boners. Samuel Holmes, of 122 Front street, has got out the specifications for a couple of steamers, 140,225,10, for the coasting trade, and they are now in the market. They will be fitted with compound engines, 30 and 25 in, cylinders by 24 in, stroke.

THE CANOE CONGRESS .- Mr. N. H. Bishop writes that he is in THE CASDE CONDESS.—SILVEL BEST OF THE STATE and the solution is inter-out canoes and data to will find floor some Penobsect Indians us experts. Contemporaries, by the way, should not get the Canoe Congress mixed up with any rowing events on Lake George. It is a separate affair altogether. made the tail-end to any rowing regatta. The racing of the for Aug. 3d, 4th, 5th and 6th, with headquarters at Caldwell, Lake

NATIONAL YACHTING ASSOCIATION.—A general meeting of all the delegates appointed will be called for March 1st, at the St. Dennis Hotel, New York. Circulars to this effect will be issued. Yacht clubs situated at a distance should make arrangements to vote by proxy, if their delegates cannot attend in person. The results of the meet ing will be forwarded to all clubs participating, before being finally adopted. Clubs can join the movement at time by communicating with the Secretary, Mr. John Frick, Post-Office Box, 2070. If any club has failed to receive the circulars of the Association, it is because its address was unknown to the Committee.

THE PAST YACHTING SEASON.

Editor Forest and Stream :

In this week's issue I see I am pulled up rather sharply by a rrespondent hailing from the happy yachting grounds of Hali-x, and whose non deplane happens to be the name of a crack hop in that locality. He corrects my statement that the non-irting of the Sweepstake race fixed for the 224 July, in which the Hebe, Petrel and Secret (sloops) and the Scafoam (schooner were engaged, did not cause "some heart-burning," Almost were engaged, not not cause some near-continus. Annoss synchronously I have received a communication from the referee on that occasion, enclosing the original "articles" under which the race was to be sailed. From this document I perceive that I was "misinformed" when I stated that this race was to be pay or play"- a statement which I made on the faith of inforeccived from a Halifax correspondent.

nation received from a marina correspondent.

The articles do not, however, contain such a proviso, and its absence of course causes my remarks to fall to the ground in all save as regards the "heart-burning," which was vouched for very plainly by my correspondent's informant-one of the Corinthian engaged in the race. referee, Mr. Passow, I have no hesitation in apologizing to the referee, Mr. Passow, whose reputation as an upright and con-scientious man equals his fame in Nova Scotia as a yachtsman. I had not the least intention of wounding his feelings, but could draw the only conclusion from the facts, as I then believed them to be ne only conclusion from the facts, as I then believed them to be, analogly, that be ought to have started the race. As it was not "play or pay," and three of the contestants refused to go, or trather their plots did, my impression is, the referee could not act otherwise. Where the mistatic lay, in my opinion, was in not misercing the "pay or play" chose, which should sovern such

In writing my raview I had perforce to trust at times to infor In writing my review than perform to trust at times to most mation obtained from others, and much regret that in this in-stance the result should have been to unjustly, although unwit-tingly, reflect upon a gentleman deservedly held in high respect,

ROUGE-CROEX.

HINTS ON CANOE BUILDING

Editor Forest and Stream :

It may interest a few of your many readers to have an actual It may interest it tow or your many reasons to have an actual builder of canoes detail how the thing is done, and if others will follow my example, canoesists may be better able to select such canoes as in model and make-up are best suited to their wants.

First, the model. [That of which I build most of is a modified. builder of cances detail be

type of the "Rob Koy"-the same in length and breadth, but wing much more "bearings." more depth, and more camber of curve of deck than the Joriginal canoe of that name—therefore more roomy, more steady and capable of carrying more sail. Any good builder can, however, make to order to any dimensions given, and in length, depth, beam, sheer, tumble home, or camber of deck,can come within a fraction of an inch, if need be. We can, therefore, lax-side model and proceed, or rather we will take the above-named model as a sumple, and describe the construction of such a boat,

The first step is the same as in building an open boat of similar The instance is the same as in our ring an open lost of sumar mensions. Keel, stem and storupost are got out, and placed on the forms, and securely fastened there. Next the siding of de-quarter inch cedar, six streaks on each side, is fitted—got out to pattern-and put on. I use a copper nail, spacing the distance with care and pail two inches apart. Now, the shell-for it is but is taken off the forms or mould, and painted inside. an egg-shell—is taken off the forms or mould, and painted inside. When dry, the ribs of red clin, [x4] finch, half round in shape, are put in one and a balf inches apart, nailed on every lap, and to the keel with copper nails, well clinched. Care is taken to have the nails come exactly between those which hald the siding only, so o that they are at an even distance of one inch apart the o Bulkheads of cedar are now carefully fitted, three feet from

Buikheads of cedar are now carefully inted, three feet from each end. Here; the jack-knife carpenter is the best man on the job. Deck timbers of sawed cedar, ixI inch, four-inch curve, all of one pattern, are put in about one for 1 apart, and the combing lax's linches (may be more or less at pleasure), of three-eighth red elm, with bent corners, is secured to its place—the ends fastened to deck timbers, and the sides strengthened by small oak knees, The most sockets and steps are next fitted, according to the rig

e canoe is now painted two more coats inside, including deck timbers, and the end compartments carefully tested, to be sure they are water tight. Next, the deek of cedar or pine, three-sixteenths of an inch thick, is not on, for which purpose some three teentus of an men times, is put of, for which purpose some times hundred live-eighth inch screws are required. The combing and mast sockets are taken out, and rasp and sand-paper used on the deck until a smooth surface is obtained, after which it is primed over, and the holes made by the screw-heads filled with putty and again sand-papered. It is now ready for its covering of and again same papered. It is now reary for its covering or cloth, which should be of the best and strongest bleached cotton. This is laid on in fresh paint, drawn very tight, and tacked along the outer edge of the siding. At the man-hoot it is cut out and tacked over the inner edge of the timbers supporting the combing. combing. The guowales are now put on, the mast sock-ets and combing replaced, and such other work as hatches, backetc., made, and the trimmings fitted, but not

permanently put on as yet.

The canoe is now ready for its final visit to the paint shop. The cance is now ready for its final visit to the plant shop. First the deck is primed, and the under side of it is painted two coats. In from three to five days it gets a coat of "rough stuff," which requires five days in which to dry, when it is rubbed down with pummice stone. This is repeated from three to six times, or until it is as smooth and hard as chony. The unmber of coats needed will depend much on how well the wood workman has needed will depend much on how well the wood workman has done his part. If now gets the three coats of color, and the skiling the same, or if finished in oil, the skiling receives one coat oil, one shellae and one of varnish. A coat of rubbing varnish is next, ondeck. After this is rubbed down striping and gilding is in order. Then another coat of best coach varnish. Put on mast

order. Then another load of best bosen varies. Fut on mest plates, cleast, etc., and your canoe is ready.

Six weeks' time is the very least in which such a canoe can be turned out, and double that time is much better to make a porfect job.

The object of covering the deck with cloth is that it preents splitting in the sun, and makes it absolutely water canoe without trimmings, will weigh about sixty pounds. nd in that condition connot be sold below seventy-five dollare and in that condition contained as some below severing—the domain off course, good, serviceable canoes can be built for half that sum if desired, but the coach roof finish to the deck will not be in-

As you have already given us an article on "Rig," from the As you have a meanly given as int antick on Edg., from the rey able pen of Commondore Chase, of the J. C. C. C., I need necespass further on your columns.

J. H. Rushton, Canton, N. Y.

YACHTING IN THE WEST.

Editor Forestand Stream :-

I take the liberty of correcting your list of winning yachts I have the hoerty of correcting your has or winning yourns, justice to blobert Brand, the builder of the yacht Currie Morgan of Lake Winnebago. Your list enrolls her with the Neemah Yacht Club, while it should have been the Ostkosh. She is owned by Geo. W. Burnell, Commodore of the Ostkosh Yacht Club. You also give her credit of having won three races out of four, while aso give net event of daving won intereraces out of our, while the fact is she has won first money in two out of six. The yachit Carrie Morgan came out in the spring of 1878. She is 25ft. Reel, 9ft. 6in. beam and 25ft. over all, and draws about 27 ft. 6in. In bal-last and spreads about 46 square yards of standing cames. The first year she won three races out of 10ve, and 15ve out of six the next year, making out of the eleven races sailed eight first prizes next year, maxing out of the eleven races smearing light first prizes won. The first race won by her was on the 23d day of August, 1878, beating the famous yacht Niohe in a twelve-mile race by Irin. 22s. She also owns the Lancaster prize, which she was obliged to win three consecutive times against the combined fleet of the lake in order to hold it, and also carries the champion penlake. Lake Winnebago, with its fleet of yachts, is a nuch pride to our citizens and an object of much angers. We have the finest fleet west of New York nant of the lake. property strangers. We have the linest new west on New York consisting of about sixty craft—schooners, sloops and cats. Among the most noted are the Carrie Morgan, Niehe, Penaqua, Mustic, Mura Bell and Mernadid-the Penagua having won first Mister, Migrat Bett and Merhadia—the Fedaqua baving won first inoney in infoteen races and the Nibble in twenty-two. The latter μ a regatth at Geneva Lake in the summer of 1877 beat the celebrated yealst Geneva and Wiksper (formerly of Now York X. C.), and afterwards at Madleon again beat the Geneva, winning 8430 in gold. The Geneva and Wiksper were both built by the wellgond. In General and Frasjer were soon built by the weit-www builder, P. Medillan who enjoys the reputation of being fastest builder in America. In every instance wherein yachts Eastern build or elsewhere have been brought in competition with those built by Brand, they have met with the same fate.

In conclusion 1 would say that Lake Winnebago, for yachting, fishing and other like sports, such as camp life and cruis ing, is u using and other the sports, such as camprine and crusing, is the surpassed by any in the United States, and parties seeking such recreation can do no better than come here and spend a sum on its shores. Owing to the constantly increasing number itors there is also an excellent opening here for a hotel.

Oshkosh, Wis.

SOMETHING ABOUT TRESPASS.

The law of trespass is of constant interest to sportsmen, who are perhaps more liable than any other class of men to unwittingly offend against its provisions. The last quarterly report of the State Board of Agriculture of Pennsylvania contains an article upon this subject, from which the following points are drawn by

Trespuss is defined as "any transgression of offense against the law of nature, of society, or of the country in which we live, whether it relates to a man's person or his property." This is its widest meaning. Ordinarily, however, it has reference only to an entry on the property of another without authority, and in doing damage while there, whether much or little. The law gives the owner exclusive control over his property. Any infringement of his rights without his permission, or justified by legal authority, therefore constitutes a trespass. It does not need that the land should be inclosed by fences. The law supposes an imaginary inclosure, which answers every purpose, and the simple act of passing it constitutes trespass, although no harm should really result to crops, cattle, or aught else. Even a person legally authorized to seize certain goods on a man's premises dare not break open doors for that purpose; if he does, his authority avails him nothing and he becomes a common trespasser. Neither is a person justified in so arranging spouts as to discharge water on another man's land, even though he never steps off his own grounds; nor to permit fifth to pass a boundary line without due permission. When a spout first discharges on a man's own premises and the contents then find their way to a neighbor's premises it does not constitute a trespass.

Hunting and fishing, however, constitute the most common and annoying sources of trespass to which our farmers are subjected. Custom has induced some people to believe they can hunt or fish on the lands and waters of other men with impunity. Nothing is wider of the fact than this. Because there can be no property in rabbits, quall, squirrels, pheasants and other feral birds and animals, they think these may be pusued wherever they may be discovered. It is hardly necessary to say that the same laws governing responses in other cases provail here. No natter that either grass nor grain are trampled down, whether gates are left closed, bars left up and no rais broke

-The orguinette is one of the most in-—The orgunette is one of the most in-genious musical inventions of the age. Those who are musically inclined will find this little instrument a never-failing source of amusement. Read the adver-tisement elsewhere and write to the man: ufacturers for a circular.

FROM Gainesville I sped back to Denison. While writing from the latter place I forgot to mention the hide and peltry houses which I visited. They show a very various game. Besides the skins of cattle, they show those of buffaloes, bears, deer, antelope, wolves, panthers, wild cats, coons, peccaries, beavers, otters, civet cats, squirrels, skunks, jaguars, etc. I never saw such variety of skins anywhere else in Texas, except Gainesville. This would leave the unsuspicious to think that these animals are more numerous in this region than other parts of Texas. But this does not necessarily follow. This great variety of skins is due to the nearness of the Redman. He is by nature a hunter, and it is hard to make anything else out of him. These various hides are the fruits of his bent of nature, as well of his necessi-ties. The Texan never thinks of skinning a skunk, peccary, wolf, or panther. Their hides are left to rot with their bodies. The Indians are more provident in their way, saving everything that has any value. They must have a rare time of it in skinning a skunk or a peccary. I judge that beavers are very numerous in the B. I. T. I judge that beavers are very numerous in the B. I. T. (short for Beautiful Indian Territory), for their skins are in these stores by scores and hundreds. To the Indian must not be credited the buffalo skins. These are brought in by the Texas cow-boys, who play sad havoc with the buffaloes when they come down, saving nothing but their skins. This year the crop of these hides is small. Not astonishing, since a year or two ago more than 200,000 of these animals were destroyed in Texas. A few years more and the buffalo will have taken his departure. We can't save him, Congress may pass laws to that end, but they will be in vain. Unless a company of cavalry accompanies every herd of buffaloes as an escort, how can you keep the cow-boys from slaughtering them and reveling in the slaughter? Can't be done.

In Denison I found a gentleman who had a young buffalo bull in his yard. I asked him if he thought the buffalo would make a cross with the domestic cow, or had any knowledge on that subject. He said he had never himself witnessed any experiment in that line, but had been told by one who claimed to speak of his personal knowledge that it would not succeed, as the cow impregnated by a buffalo bull lost her life in parturition. He said this was by reason of the "hump" imparted by the bull to his offspring. Buffalo cows are humped but little. How would it succeed with the domestic bull and the buffalo cow? I think the experiment ought to be tried.

buffalo cow? I think the experiment ought to be tried. I believe it would improve our beef both in quantity to the carcass and in quality.

From 1 enison I rode south to Sherman, nine miles. It has 10,000 people, and is surrounded by one of the noblest countries in the world. It is good for wheat, corn and cotton, which are all grown on the same farms. Country generally a rolling, black, waxy prairie, resting on a soft linestone of the Tertiary age. Sherman would be pretty if its streets were paved. Built on a black, waxy prairie, in rainy weather it can beat creation for mud. The people area good class, Americans for the most part, who seem to be about equally divided between North and South. They live in perfect harmony, as completely blended to getter as it is possible for a people to be. It is an every-day thing to find a "boy in blue" married to an ex-peole girl, and a "boy in gray" married to the "boy in blue's "sister. It brink the Northern element preponderates in numbers. It is a progressive and prosperous community.

and a "boy in gray" married to the "boy in blue's "sister. Ithink the Northern clement preponderates in numbers. It is a progressive and prosperous community. This may be said of all North Texas which I have seen on this trip. When the railroads push on further west, Sherman must necessarily lose some of the great trade which she draws from that direction; but in spite of this she must always be prosperous. She can keep fat on the great country around her, and grow fatter as this great country increases in population and wealth, which it is rapidly and steadily doing.

McKinney is about thirty-live miles south of Sherman, on the Houston and Texas Central, It is a place of about \$2,00 people. The county in which it is situated is said to be the richest in Texas. It is said that there is not a foot of poor land in the whole country. As far as I have been able to observe this is certainly correct. The land is the same black, waxy sort, resting on a soft megnesian limestone, which is here called the "white rock." This stone is a marl, and is easily cut by the plow when it comes near the surface. The English would call it "corn-brush." Where this rock comes near the surface

proposed to the propose due to the state of
the trail, the Indian standing by his canoe, and no deer in sight. On accosting him he assured us that no deer bad come in, and that the dogs lad come out of the woods a short distance above. I at once made up my mind that he had been asleep and allowed the deer to mind that he had been asleep and allowed the deer for get away, and subsequent information proved I was correct; but to make sure, we hunted the dogs up and down the heach half a mile each way to see if the deer had taken water and then came back on the same side—a favorite trick of does, particularly early in the season before they separate from their fawns but one rarely practised by a buck, who, if he once takes water, strikes out for the opposite shore and goes there, unless frightened by a noise or turned by a boat. After giving the dogs ample time to find the back track to the woods, had the deer taken to the same side as we were on, and not being able to find any, I concluded our hunt for that day was at an end. I was not in the best of humor with myself or master Jimmy, being annoyed with him for being able to find any, I concluded our hunt for that day was at an end. I was not in the best of humor with myself or master Jimmy, being annoyed with him for losing the deer, and at myself for trusting to his watchfulness. I called the dogs to the canoe and prepared to go home. Madam Venus, however, was not satisfied with this state of affairs and jumped out of the canoe and made for the woods; neither coaxing nor scolding would induce her to come back. At length, when out of sight and perhaps out of hearing of my voice, we were cogitating whether to leave her and go home, or not, knowing she was safe, as she would go to one of the logging camps near by when through with her hunting, when we heard her burst forth in a manner that assured us she had started a deer, and was close enough proba-

were cognature whether to leave her and go home, or not, knowing she was safe, as she would go to one of the logging camps near by when through with her hunting when we heard her burst forth in a manner that assured us she had started a deer, and was close enough probably to see it—so loud, frequent and angry were her utterances. This turned the tide of affairs, and shoving the came ashore, we let all the dogs go, and in a few moments all were in full cry.

Determining not to less this deer if we had anything like a chance to get it, and cautioning the Indian to keep his eyes open this time, we went below to watch the lower runway, and on arriving there, probably a half a mile below the upper one, and certainly not more than twenty minutes after the deer was started, on looking around we saw back of us a fine buck in the water. We wheeled the canoe around, and in doing so attracted the attention of the deer which turned and changing his course from right angles to the shore, commenced swimming away from us parallel to it. I saw he was likely to go ashore, and as the dogs had made two runs would probably refuse to make the third if this deer got away from us this time. Although a long way off I determined to make a shot, as he was rapidly nearing a point which would, as soon as he turned it, hide him from us. Besids my breech-loading shot gun I had a Ballard sporting, rife. I fifted the rife and shot, but apparently missed. He turned at this and with a few strokes reached the shore and took a course up the beach. When he came to the Indian, Jinmuy fired and missed him, but turned the buck back. Old Jack, who had come back to the canoe where the Indian was, now took after the deer, After running a short distance down the beach, the other three dogs, who by this time had come out of the woods, met the deer which, however, avoided then and kept on towards from and myself. A prettier sight I have same show before or since; the deer a few yards ahead and the dogs close together, giving all the tongue they could. As t

Matural Distorn.

BIRD NOTES FROM LONG ISLAND.

BY GEORGE LAWRENCE NICHOLAS

[Note.—Our correspondent, Mr. Nicholas, has sent us a very interesting list of the birds observed by him during the summer of 1879 on and about Shinnecock Bay Long Island. The list includes notes on 101 species, and contains no little valuable information. With our correspondent's permission we have made such selections from it as appear to be of the greatest ornithological interest

it as appear to be of the greatest enrithological interest and print them herewith.]

Stalta stalts—Blue bird; very common. I have witnessed many a quarrel between these birds and the martins. The martins generally come off victorious, and the blue birds are compelled to resort to holes in trees, where they breed in great numbers.

Certhia familiaris—Brown creeper. Saw a single specimen on the 20th of July.

Parala americana—Blue yellow-back warbler. Saw a single specimen on the 14th of July.

Seiturus hudovicianas—Large-billed water thrush. Obtained a single specimen on the 3dt of August.

Cytyle riparia—Bank swallow. These birds are also very common, and breed in great numbers in the sandbanks. I took several nests containing eggs on the 6th of July. One of the nests contained a young bird, an egg nearly ready to hatch, and two perfectly fresh eggs. egg hearly ready to hatch, and two perfectly fresh eggs. A number of the other nests contained eggs nearly hatched and fresh ones. From this I infer that the swallows at times g thirto each other's nest.

Progne purpower—Purple marfin; very common; breed in vast numbers in the boxes put up for their use, with also in belge in trees.

Progue intrinted—tuple institutively common, bread in wast numbers in the boxes pix up for their use, and also in holes in trees.

Tachygineta bicolor—White-bellied swallow; common. This bird, like the martin, breeds in holes in trees. They also build their nests under the eaves of the barns and houses, and it is not uncommon to see the

caves of a barn sheltering twenty or thirty of these nests and the resis of the cliff swallows.

Collurio ludovicianus—Logger-head shrike. Obtained a single specimen of a young bird on the 4th of August.

Tyrannus carolinensis—King-bird; common. While at the same place in the summer of 1877 I found one of these birds nests, containing two eggs. I took one, and came down from the tree, and the bird came back, but left it again after being there about half a minute. On again ascending the tree I found that the other egg was gone. From this I think that the bird must have carried the egg to a place of safety

Fulco sacer [?—Ed.]—Jerfalcon; saw a single specimen in the latter part of August.

[Since this article was in type we have received from the author the following note with regard to this occur-

Your favor of the 9th received, and I would say by Vour favor of the 9th received, and I would say by way of reply that I am quite positive as to the identity of the jerfalcon (Falco sacer) which I saw. It was quite early in the morning, in a pine swamp quito near the bay. I first observed the bird perched on a tall dead tree; he afterward came slowly up to where I was, not flying as bawks usually do, but flapping along much after the manner of a crow. He approached within about sixty yards of where I stood, and my companion, who was nearer to him than I, fired at him but failed to kill. I afterward observed him slowly moving over the marsh, and although I watched him until out of sight I did not see him sail as other bawks do, but he was continually flapping his wings. He perched often, and I at one time saw him catch some kind of large snipe or curdew. I regret very much that I could not obtain it, and had such a short time to observe it, but from what I saw I saw I a short time to observe it, but from what I saw positive that it was none other than the Falco sucer

In the absence of any more direct and positive evidence, we are inclined still to doubt that the bird seen was Falco sacer. It appears much more probable that it may have been Falco communis, a species which is known to broad in Connecticut and Massachusetts. By reference to Dr. Merriam's excellent list of the birds of Connecticut (Trans. Conn. Acad. vol. iv., 1877) our readers will observe that this species has been taken on Long Island Sound in June, and an occasional specimen might well be found on Long Island .- ED.]

Orlyx virginianus—Quail; very common; these birds are rapidly increasing in numbers; they come almost up to the doors in seeking their food.

to the doors in seeking their food.

Ereunetes pussiblus—Semi-palmated sandpiper: common in August. This bird is noted here in very large flocks. So abundant are they that a single discharge into a flock has been known to kill as many as one hundred. They are here know as the ox-cyc.

Limosa fedoa—Great marbied godwit; saw a single specimen. This bird is here known as the red marlin.

Totams semipalmatis—Willet; I had the good fortune to obtain one of these birds, which is almost pure white, having only a slight brownish tinge on the wings. The bill was lighter than it usually is. The eyes were black, and the feet colored as usual.

and the feet colored as usual.

Totanus solitarius—Solitary tattler. This bird, I have reason to think, is quite rare here. I obtained but one pecimen, and that none of the gunners of the bay could

name.

Actiturus bartramius—Upland plover; quite cmon, but very wild. This bird is here known as "

mility."

Macrorhamphus scolopaceus (?)-This bird I obtained with minty.

Macrorhamphus scolopaceus(?)—This bird I obtained with another which was said to be the same, but I afterward found it to be a dowitcher (Macrorhamphus griseus). They were shot in the company of five dowitchers. The one which I am still in doubt about had a very strange note, being entirely different from that of the dowitcher; it was made up of socral quick, sharp whistles. The length of the bird, taken from the dry skin, is 11½ inches, the bill over 2½ inches long. I am quite sure that it is not a dowitcher, as it is quite different in color, the under parts being like those of Tringa canutus, and only the throat and sides under the tail being spotted. The tail when spread looks decidedly tawny. Mr. Lane, with whom I was staying, says that for the past three years he has seen these birds in company with the dowitchers, and that they seem to be increasing in numbers. He and the other gunners of the house also say that they have never heard this bird give a note anything like that of the dowitcher. dowitcher.

RAVENS AND CROWS.

THE raven dwells mostly in the mountainous and America, extending southward into Mexico. According to Prof. Baird they inhabit the entire continent of North

America, extending southward into Mexico. According to Prof. Baird they inhabit the entire continent of North America, but are rare east of the Mississippi river. See Pacific Railroad Report vol. ix, p. 560.

The raven is a rare bird east of the Mississippi, being seldom seen far away from rocky precipices and mountains. In botanical excursions among the mountains of the Southern Stites I have often seen and heaval them, nor is their voice unpleasant to me, for it has been a frequent accompaniment of things which I love—mountains and rough scenery. The raven dwells and breeds in the mountainous regions of Texas, from the mountains of Llano County northwestward to the Rio Grando and beyond into the mountains of Mexico. Beyond Fort Davis, on the route to Fort Quitman on the Rio Grande, in El Praco County, there is a noted camping place called the "Grow's Nest." Here there is a spring at the base of some perpendicular cliffs, in an inaccessible cavity of which the ravens have a nest. On a trip to El Paso in 1875 Isaw this nest. Our party was large, and we always encamped at night. In the morning as soon as we started for the day's journey, and were beyond shooting distance from the camp, flocks of ravens went there to get the fragments of provisions we had left. In Texas the crow does not dwell in the region inhabited by the raven. In for the day's journey, and were beyond shooting distance from the camp, flocks of ravens went there to get the fragments of provisions we had left. In Texas stie crow does not dwell in the region inhabited by the raven. In the region inhabited by the raven. In the colorado River. I think none breed west of San Antonio, but they are increasing rapidly and enlarging their boundaries. An old surveyor who had surveyed and located much land in Western Texas told me that thirty traveler's eye,

or more years ago in the latitude of Austin no crows were found west of it beyond a few miles.

or more years ago in the latitude of Austin no crows were found west of it beyond a few miles.

Audubon, appealing to the known generosity of the American people, says he "cannot but wish that they would reflect a little and become more indulgent towards our poor, humble, harmless and even most servicebale bird, the crow." But the crow is not poor, notwithstanding the old saying, "as poor as a crow." Blest with an appetite for both animal and vegetable food, nature provides bountifully for his wants, and he skillfully supplies them. Nor is he humble, for there are no birds inore bold, arrogant and noisy than he; nor is he harmless, but a thick and robber. He robs the nests of other birds of both eigs and young, and this is one great cause why insectivorous birds are decreasing and crows increasing in many parts of the country. Here the crows destroy waternelous by going from one nelon to another and picking small holes into them, as if testing each one, only making a hole just big enough to spoil the melon. A near neighbor of naine who raises waternelons for market, told me that the crows destroyed at least, \$25 worth of his melons last year, and the damage word. New Sean unche, creater held not the field finally words. melons for market told me that the crows destroyed at least \$25 worth of his melons last year, and the damago would have been much greater had not the field finally been guarded by a man with a gun. This man said that he could not shoot any of them because one crow was always stationed as sentry to give notice of his approach. Crows are fond of pecans and accorns. The last fall they took most of the pecans in this neighborhood, more than usual being taken because a short crop of corn was raised and gathered early, leaving the crows without their usual sumbly. supply. Many years ago, when I was living in Northern New

Many years aco, when I was living in Northern New York, in Yates County, I could not find the nest of one of my turkey hens, and I knew she had been laying for several weeks. One day I watched until I saw lyr go on a nest under some plum trees about twenty rods from the house. I then went to the house and up stairs to a window where I could see the turkey, and as soon as I saw her rise and begin to cover her nest with leaves I started, and when almost there a crow who had been watching also on a near tree flew down, darted his bill into the ner rise and begin to cover her heis with leaves I started, and when almost there a crow who had been watching also on a neur tree flew down, darted his bill into the egg, raised his head and flew away frumphantly with it. There were no more eggs in the nest, the crow having carried them off as fast as laid. Audubon relates that he has seen them do the same thing with the eggs of wild turkeys. In Western New York they used to catch young chickens, and so they sometimes do in Texas; hence, for all these and many nore sins, I dislike crows and would give them no profection.

Audubon mentions that a bounty was given by one State—he does not give the naue—for the destruction of crows, and that 40,000 crows were there shot in one year, besides a great number of young ones which were killed in their nests, and also other old birds were destroyed by poisoned grain spread on the ground. My watermelon neighbor fried to kill the crows with poisoned corn, but they would not touch it.

S. B. BUCKLEY, Austin, Texas, Jun. 9th.

Austin, Texas, Jan. 9th. PASSERCULUS PRINCEPS IN NEW JERSEY. Philadelphia, Pa., Jan. 30th.—While gunning on the southern end of the Seven Mile Beach, New Jerscy, December 30th, 1879, I took a female Passerculus princeps. I first noticed it flying in a flock of shore larks among the sand hills, and seeing that it was a sparrow different from any I had before met with, I followed up the flock and shot the strange bird while sitting on a piece of wreck. It proved to be an Ipswich sparrow, and on searching for others I came on one or two, but was unable to secure them. As I was only on the beach for about half an hour. I did not have much time to look for them, but have no doubt but that they were common among the sand hills. I believe this to be the most southern locality where this sparrow has been taken, its most southerly record being Coney Island (Nuttall Bulletin, July, 1877). WM, L. Аввотт.

WINTER NOTES FROM IOWA .- Our correspondent W., to whom we have in the past been indebted for so many interesting bits of Natural History news, sends us from Coralville, Iowa, a few notes referring to the mildness of the present winter in that State. She says :-

the present winter in that State. She Says:—
Charles Hoover, of this place, shot a Wilson's snipe in this vicinity December 3d...On the morning of the 6th of January our ears were greeted by the sweet notes of robin red-breast...Several individuals report having seen flocks of geese passing northward January 18th.

MISSOURI ORNITHOLOGY.-We notice in the January number of the Kansas City Review of Science and Industry a pleasantly written article entitled " Peculiarities of Missouri Ornithology," by Ermine Case, Jr. Tho essay, though the information which it conveys is somewhat elementary, is written in a popular style, and is in-

teresting.

Albino Robin and Black Opossum.—Jacksonporl, Ark., Jan. 8th.—Two years age I killed (and I think reported in your paper) an albino robin near here. The specimen had the albino eyes, but the plumage, both the dark and the red, was evenly mixed in with white, alternating a white and slate-colored feather on back, a white and red on breast. Even the wings and tail were thus variegated. In my eagerness to secure the specimen I killed it at short range and could not preserve it. The appearance of the bird while alive was very singular.

One of the curiosities of this season is a perfectly black opossum (Didelphys virginianus), the skin of which I saw yesterday at the store of Mr. John McDowell, of this place. This may be common enough, but was the first

This may be common enough, but was the first

Hish Culture.

THE IMPORTANCE OF FISH CULTURE.

THE following extracts are from the speech of Hon.
Levi P. Morton, of New York, before the House of Representatives, during the discussion of the bill to appropriate \$20,000 to enable the United States to be represented at the Berlin Fishery Exhibition :-

resented at the Berlin Fishery Exhibition:—
The production of fish is a source of national wealth, and in the early history of the world it was a preventive of famine and distress. Experience has shown that while it is a luxury of the rich it is preeminently the poor man's food. This is understood thoroughly in the countries where food production and cheap living are carried to the greatest perfection. It is estimated that about forty-five millions of Chinese subsist almost entirely on fish.

five millions of Chinese subsist almost entirely on fish. But it is not merely inland fisheries that are of importance to the poor. The sea fisheries are hardly less so, If properly developed, the price of fish would be so much lowered that the man who could not buy would be rare indeed, and so little capital is uccessary for the business that there would be sufficient profit left to those who car-

indeed, and so little capital is uecessary for the business that there would be sufficient profit left to those who carried it on.

Other countries do not look upon fisheries as we do. One of these international exhibitions was held at Bergen, Norway, in 1865, at which the fish of all the great countries and many of the lesser ones were well represented. Insignificant Bavaria sent 69 contributions; Great Britan, 174; Sweden, 363, and Holland, 453. How many came from this country? One! Another exhibition was held in France in 1866, and our fish were not presented at all.

The French government has given so much material aid to this business of fish culture that nearly all her waste waters have been furned into nests for the propagation of fish. One of the earliest and most extensive establishments for the culture of fish is that erected by France at Runingen, which went into operation in 1852, and in six months had artificially fecundated 3,000,000 eggs and produced 1,600,000 living fish.

It is only necessary to call the attention of the public to the subject for it to appear that there is not a State which is not interested in the matter.

Mr. Chairman, not many years ago the vast internal improvements of this country—the erection of mills, dams and factories—threatened the extinction of the most valuable species of fish in our rivers. This calamity was provented by the timely discovery of the art of propagating fish by artificial means, and at the same time the domand was greatly increased through the aid of railroads, which have made transportation easy between remote points in a brief time.

pagating is by artificial means, and at the same time the demand was greatly increased through the aid of railroads, which have made transportation casy between remote points in a brief time.

In 1840-50 salmon cost twenty times the price it commanded when we ceased to be colonies of Great Britain. The Connecticut River, which had been one of the most fertile ish streams in the world, became almost depleted. Few, however, understand the methods of replenishing our waters from which the most valuable species of fish have been banished. This result is due to a discovery made in Germany, and afterward in France, that fish can be propagated to almost any extent by artificial means. This simple fact has led to the creation of one of the most important industries of modern times. The nations of the world have derived incalculable benefit from this discovery, and we are now invited to join in an international comparison of the character of our fish and the methods of our fish culture. It is to this science to which I have referred, and which this resolution is designed to encourage and extend, that wowe the restocking of our waters; to this we owe the fact that millions of young shad were hatched at Holyoke, Massachusetts, and turned into the Connecticut River.

In view of the possibilities of our shores, our measureless streams and our inland seas, we should lead all nations in the world in availing ourselves of every item of information on a subject of such importance to our people and their industries. The annual value of salmon alone in Ireland is now about \$2,500,000, while in this country it averages from thirty to forty cents a pound. The oysler-beds in Virginia alone cover an area of about surveteen hundred thousand acres, containing about eight hundred millions of bushels.

It appears that in 1874 Norway and France, each smaller than some of our States, produced respectively, one-third more tish than the United States. In 1862 the tonnage of American ships engaged in the see fisher in her favor of \$15.258.957

eries amounted to 204,107; in 1874 it had fallen to 78,200 tons.

In the fish trade in 1865 Norway had a balance of trade in her favor of \$13,588,975. Why was this? Because she resorted to fish production as it is proposed the United States Fish Commissioner again says:—

"Norway is the only European nation that has a scientific commission occupied officially in the supervision of the fisheries, and in devising methods by which they may be carried on and extended with the least possible waste. To the labors and observation of such men as Dr. Beeck, Professor Sars and others, is due much of the present efficiency of the Norwegian fisheries."

In 1867 we imported about as much fish as we exported. If we devoted sufficient energy to the business we could export one hundred times as much, and need import none at all.

Fish culture is in its infancy. Its resources are immeasurable. It may approximate and even rival agriculture in importance. Its development will give employment to large numbers of men and bring food within the means of the poor as well as of the rich. The propriety and tillity of international exhibitions, where the representatives of our nation can learn the nature of the products of the others as well as show its own in a universal market, can no longer be questioned.

Washington.—Prof. Baird appeared before the House Committee on Appropriations Feb. 17th and requested that an appropriation of \$12,000 be made to furnish a fish-hatching steamer to be employed along the coasts of South Carolina and Georgia and Florida. He also desired the Secretary of the Navy to be empowered to detail an officer of the navy and sufficient number of seamen to man the vessel.

PROTECTION TO POTOMAC FISH,—Washington, Feb. 16.— Mr. Samford, of Alabama, who is a member of the House Committee on District of Columbia, has introduced a bill for the much needed protection of fish in the Potomac River within the jurisdiction of the District. It provides :-

That it shall not be lawful to fish with fyke net, pound net, stake net, weir float net, gill net, hand seine or any other contrivance, stationary or floating, in the Potomac, within the district of Columbia, after the 30th day of net, stake net, weir float net, gill net, hand seine or any other contrivence, stationary or floating, in the Potonac, within the district of Columbia, after the 30th day of May in any year. That during the fishing season, viz: From the 1st of February to the 30th day of May, in overy year, there shall be observed in each week a closed season, beginning at sundown on Saturday evening, and ending at midnight on Sunday night, during which time it shall be unlawful to lay out any hand seine or float net, or fish the same, and all stake-outs and the leaders of all hedge ponds, fyke nets or weirs shall be lighted clear of the water, so as to allow unobstructed passage to the fish: Provided, That in the case of weirs it will be sufficient to remove a section of the hedging next the pond or pen, not less than twelve feet in length. That it shall be unlawful for any person to take in any other member than by angling or with the out-line, any fish of the species known as "black bass" or "sulmon. That it shall be unlawful for any person to have in posession or expose for sale in the District of Columbia, after the 30th of May in any year, fish of the shad or herring species, fresh, under a penalty of \$5 for every fish so exposed or found in possession, that any person who shall offend against any of the provisions of this act shall be deemed guilty of a misdemeanor, and upon sufficient proof thereof in the Police Court shall be fined not less lian \$10 nor more than \$100 for each offense, and shall forfeit to the Dsitrict his nets, boats and other apparatus, which shall be sold and the proceeds of such sales and all fines accruing under the act, shall be paid into the Treasury, and therefrom to the informer, in each case where conviction ensues, shall be paid the sum of \$2. Provided, That nothing in the act shall be constructed to prohibit angling of fishing with the out-line, or to prevent the commissioner of fish and fishing or his agents from taking from the waters named in any manner desired fish of any kind for scien

propagation.

HATCHING TROUT IN A CELLAR.—Eagle's Nest, Feb. 10th.
—And now a word about a frout enthusiast in Stanford.
New York. John N. Bennett is the man. He has now five fine trout ponds well stocked with various sizes.
Only last spring he lost over three thousand nice trout, many of them large, through the filthy drainage of a creamery on the stream which supplies his pond; but that has been remedied by more care at the creamery and a grated filter of ten feet depth at the inlet to the ponds. And now, in the depth of winter, with the thermometer much of the time below zero, Mr. Bennett is hatching trout in his ceilar in a most ingenious and interesting way. He pumps water from his well into a barrel, and through a small pipe lets it run into a box constructed on the principle of the Holton hatching box. Heuses about one hundred and fifty gallons of water in twenty-four hours, and has succeeded in hatching seventy-five per cent. of the eggs taken. He took the eggs front trout in his own ponds. The eggs taken on the 14th of November commenced hatching Jan. 24th, temperature of water kept about 48 degrees. The fry are lively and doing well.

Now this is a nice winter indoor amusement, and perhaps next winter some more readers of the FOREST AND STREAM will try it. Mr. Bennett is one of your subscribers, and as earnest in fish worship and fish culture as Seth Green himself.

Green himself.

**LIBERATING FRY.—Miramichi, Feb. 12th.—An article in FOREST AND STREAM of 6th inst. leads me to ask through you whether it does not occur to your fish culturists that the proper time to liberate artificially propagated iish is a week or two before they are to liberate themselves from the ova? Have any of your readers interested in fish culture tried the experiment of depositing the eggs on natural spawning grounds, and watched the result? There is an opinion held by many who know something of the subject that much better results may be obtained by disposing of the ova in the way suggested, than by keeping the young fish until they are familiarized with objects which, in their natural condition, would frighten them into seeking protection, and consequently become easy proy "to the almost innumerable finned, winged and furred enemies seeking to devour them.

Nebraska—North Platte, Feb. 4th.—I was commissioned by our North Platte Sportsmen's Club last week to go for 5,000 salmon lish, which the Slate of Nebraska have been stocking their streams with to plant in the waters of some of county streams, which we did; and will put in bass and trout in their season. W. W. C.

—In the Salinas, or salt marshes, near Cadiz, Spain, a peculiar kind of crab abounds, of which the hind claws are considered a great delicacy. These are pulled off from the live crab, which is then set free to develop an-

—Efforts are to be made to secure the enactment by the Texas Legislature of some laws for the protection of fish. The only enactments now in force provide for the construction of fishways and prohibit the use of nets and traps between Feb. 4th and June 14th.

-The United States Mining Investment Company will be hailed with satisfaction by a great many of our Western friends who have an eyo to the golden opportunities the untold wealth yet hidden in the "Rockys" is bound to afford. The hunter and trapper and the sportsman on a tour often meet with the chance of picking up some "prospect holo" for a more song and developing what was a "locatiou" pure and simple into a promising mine. When they seek to float their lucky ventures, no quicker or surer method can be found than to obtain the official indorsement of the United States Mining Investment Company.

FISH IN SEASON IN FEBRUARY

Pompano, Trachinatusaradimes. Grouper, L'pinepheljus n'aritus. Druin (two species). Family Tract (thoic bass), Contropristantly the Control of the Control o

Red Snapper, Latianus blackfordti.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory Game and Fish Resorts, our correspondents are requested to give the following particulars, with such office information as they may deem of value: State, Town, County: means of neces; Hote and other accommodations; Game and its Scason; Fish and Li-Season: Bouts, Guides, etc.: Name of person to address.

SNARING AN ALLIGATOR.

In my last I detailed the efforts made to snare a deer and the results attending, which efforts led to the following exciting adventure.

Our stay in the section referred to was protracted into the summer, and we spent much of our time tishing. We were truly in an angler's paradise. Two miles back of us was the W—River, with numerous large creeks emptying into it. Six miles west of us was the bay into which the W—and S—rivers emptied, making a very commodious harbor. In front of us, five or six niles away, was the Atlantic, with numerous small inlets and numbers of small islets. Fish of every description was abundant, and it may well be believed we enjoyed ourselves to the utmost. Our most serious drawbacks were snakes and alligators, and so numerous and so ugly were these that till this day the cold shivers creep down my back when I think of some of our narrow escapes from these venomous and disgusting reptiles.

One day we had been fishing in one of the "reserves"—un immense body of water reserved to flood the rice fields—and we had found snakes and alligators particularly numerous, so much so that they became almost our sole topic of conversation. We had shot large numbers of them, so many, indeed, that we failed to extract any turther interest from it.

While we were talking, one of the party said:

"P—, why don't voil and Joe soare one of those

While we were talking, one of the party said: "P—, why don't you and Joo snare one of these 'gators' Your success with the old bucks warrants you in trying your hands."

A laugh followed, as it always did at any mention of

our deer scrape.
"What say you, Joe?" I asked, when the laugh had

"We can do it," he answered, "and if you say so, wa will,"

"We can do it," he answered, "and if you say so, we will."

Of course I assented at once.

When we reached home we began to discuss ways and means, and in the course of the next few days we rigged up the following contrivance: we procurred a strong seven-eighths manilla rope, forty feet long; as small halter chain (twisted links), eight feet long; and a piece of well seasoned hickory. The latter we cut to a length of eight inches, leaving the diameter one and a half inches, and bringing the ends down to a long sharp point. At the center we girded it with a quarter inch groove, leaving the diameter still one inch. We now repaired to the blacksmith, and had him forge a link three inches long of quarter-sinch iron, one end of which we slipped into the groove on our stick, and then putting the laider-snap in the other end we put the center of the link into the vise, giving it a severe nip, bringing the sides of the inks together and securely lastening the stick of wood to the link. To the other end of the chain our rope was fastened. Our snare now had the appearance of a cap T with the upright stroke very much elongated. We now procured a ten-pound chunk of beef, into which we securely wattled the piece of hickory, and then, bringing one end of the stick parallel with the chain, we fastened it there with a bit of yarn.

Renairing to the reserve we selected a spot, secured our

wattled the piece of hickory, and then, bringing one end of the stick parullel with the chain, we fastened it there with a bit of yarm.

Repairing to the reserve we selected a spot, secured our rope to a pine tree growing near its edge, and then by the aid of a canoe we carried the bait out as far as the rope would permit. To insure the floating of the bait near the surface of the water we laid the rope across a five-foot strip of plank. Everything completed, we retired to await developments. Early next morning we were at the reserve, and there, sure enough, we had a gator fast, and judging from the muddy condition of the water he was a whopper, and had been there some time. The rope was moving through the water in quite a rapid manner, and without unfastening it we made a pull with all our strength, but we might as well have tried to fift an elephant by the tail. The question now was what to do with the chap since we had him, and in order to solve it the whole party were invited into the discussion. After much talk it was suggested and agreed to that we make use of a small wagon and a pair of mules belonging to the party. I went for the team and in my haste did not take time to put the body on the wagon, it having been removed for the purpose of hading wood. Hastily throwing a plank across the bolstors, I seated myself and drove over to where the party awaited me.

The rope had been secured by a slip—low without.

I seated myself and drove over to where the party awaited me.

The rope had been secured by a slip—low without passing it around the tree, so we had only to fasten the loose end to the hind axle and drive away, and thus slip the knot and make a direct pull on the 'gator'. After securely fastening this rope to the axle I seated myself on the plank and gave the mules the slack. The mules were young, fiery and hardly broken to harness, and had repastedly run away, endangering our lives on more than one occasion; but we had not thought of this in our excitement. For a moment after starting the team there was a strain on the rope, and then out came the huga monster, covered with mud and lashing the water into feam with his tail, the noise he made resembling to some extent the beatings of a huge propellor. The mules both mules bot foam with his tail, the noise he made resembling to some extent the beatings of a huge propellor. The mules both looked around; and as they did so the measter gave a roar that made the very earth tremble—and the team, alligator, and your humble servant started for home. The distance was about two miles, and I think if Rarus had seen us he would have left the track with a broken heart,

The mules left the road—in fact, made a new one without the aid of a surveyor—and that alligator bounded in the air as he never bounded before. Now and then he would rap against a tree, but he scarcely touched the ground, and I had serious fears for a while that in his anxiety to go ahead he might put a head on me; however, we reach d home at last, and the mules, completely winded, stopped of their own accord. When we came to sum up we found all the "run" taken out of the mules, one tire gone, three spokes in another wheel broken—in fact, the wagon a wreck; my suit of clothes torn to rags, and my person bruised, torn and bleeding by the terrible whipping of the trees and bushes over which we had passed; and a fourteen-foot alligator with every bone broken and almost skinned by his constant banging against the trees. More anon.

HART-TRECEER.

FISHING IN THE GULF OF MEXICO.

JUST as the sun was sinking in the West one June day in the lowest of the Lawring in the lowest of the Louisiana lowlands, the powerful tow-boat Ocean steamed up to the wharf. Our party of twelve or fifteen ladies boarded her, and with merry music and song we ran out through the jetties.

Do you remember how only a few years ago Mr. Eads was criticised, and laughed at for proposing to hold the grand river in "Willow Walls;" how Congress reluctantly granted him the privilege of operating, at his own expense, on the smaller of the three passes, the one that was uscless for commerce, through which even the light draught vessels that visited New Orleans could not pass. This vast river, which I have hunted and fished along

expense, on the smaller of the three passes, the one that was uscless for commerce, through which even the light draught vessels that visited New Orleans could not pass. This wast view, which I have hunted and fished along from its sources in the Rocky Monntains to its mouth, brings down in solution with its flood an immense amount of sand. At the broad lake, formed at the head of the passes, where it separates into three mouths for each the cocan, it becomes sluggish. This causes the sediment to settle and form shallows, and the same cause, the rapid flow of the fresh water being deadened by striking the heavy wall of salt water, forms bars at the mouths. After the Congressional permission was given work was commenced. Vast quantities of willows were collected and interlaced into mattresses; thousands of tons of stone were brought from the Ohio, for we have no stone in these low lands, and with the stone the willow mattresses were sunk, one on top of another, until two long narrow lines were run through the swamps and out into the Gulf. Dams and dykes were built at the head of the passes to get the proper volume of water to run between these new lanks. Wing dams were run out an ato catch the sediment so that it would build banks against the mattresses. Great cribs built of logs and filled with rock were sunk to protect the see ends. Gradually the current quickened, and what the engineers call the scour commenced; that is, the current wore the bottom of the chanuel away. It went on, little by little, and grew the mattresses. Great cribs built of logs and filled with rock were sunk to protect the sea ends. Gradually the current quickened, and what the engineers call the scourcommenced; that is, the current wore the bottom of the channel away. It went on, little by little, and grew deeper and deeper, and to-day there is a clear channel of twenty-eight feet depth. The sediment settling in the eddies of the wing dams has built a solid bank against the mattresses on the river side, and the sand of the Gulf has washed in against them on the outside and formed reefs and great marshes covered with long grass and cames, making a feeding ground and haunt for thousands of sea birds and bay birds—a splendid winter sporting ground. The jettles are now being capped with concrete. Towers have been built on each end containing great from cubes, in which the concrete is mixed and emptied into a car that is run under it; the car is then run out over a rail track that extends along their top. Large plank molds have been built, resting on the stone and willow; into these molds the concrete is dumped from the car and left to harden into immense blocks of stone, some of which weigh seventy-two tons. And now the willow walls that so many laughed at ner the solid banks of the river, the new land forming on either side of them keeps them in place, the current ronning through scours a deep claumel, and the lateral current of the Gulf, running across the ends of the jettles, will prevent any bar formation there. The continuous parapet of concrete that is to finish the top will form a solid muss of rock, against which old ocean can lash himself to spray and rambows.

Steaming out on to the Gulf we reached the fishing grounds. The music and the song ceased. Descending to the deek we were soon engaged with the lines and bait that Capt. McClellan had kindly provided.

First fish for one of the ladies, a beautiful soa trout, Satmo trulta. Then a silvery ribbon fish, by another lady. Amidst a splashing and screaming—for ladies will servan mind the

instory that cutting a being's throat is a benefit. Reader, are you an epicure? If so, have you ever tasted red snapper fresh from the brine of the Gulf? I give the sheepsnead his place as a food fish, but it is in a muche one degree below. Both were biting right briskly this evening. We could tell the species by the strike. The sheepsnead is comparatively key, and not so gamy, but the red snapper takes the batt with a rush, and fights to the end.

but the red. snapper takes the bait with a rush, and lights to the end.

We caught small fry of all kinds, many of ne value; but one or the ladies aid, as she added a little cat to ber little to the ladies aid, as she added a little cat to ber little to the ladies aid, as she added a little cat to ber limited by and little to make my pile. If the lad hardly finished speaking when she screamed and held back on her line as if there was a runaway horse at the other end. Capt. McClellan, standing near, grasped the line and called for a boat-hook; and now the tug commenced, the gallant Captini and a pretty girl on one end, and a shark on the other. One moment the shark would seem to be pulling them, overboard, the next the line would come slowly up. We all looked anxiously on, fearing the line would break, or the Captain and the lady be pulled into the Gulf; and I am sure every sportsman will agree with me that any result would have been preferable to having the line break. One of the men stood by with a boat-hook, as he said, "to give him a stomach-ache when

he showed above water." At length he got a chance. A quick lunge, and the boat-hook was firmly fastened in its tough hide. Another hook was made fast, and he was raised over the bulwarks, and added to the lady's pile. A single switch of his tail, and where was that pile and several others near? He scattered fish, chairs, men and ladies in every direction, and we thought would hammer the deat though with the tail, but the deck through with the terrific thumps of his tail; but the sailors soon showed their love for the family Carchanas glancus by beating him to death with boathooks. Another, but smaller one, was captured, and the piles of food fish were augmented by catches from both

plies of food asa were augmented by extense from both sides of the boat.

The merry "Yo, heave aho," blending with the music, song and laughter, reminded us that the anchor was coming up for the home run. Point A. L. Outre light was seen to the east, and soon we were running in becoming up for the home run. Point A. L. Outre light was seen to the east, and soon we were running in between the red and white lights that mark the mouth of the jetties. The present lights are only temporary, but it is the intention of the Government to erect two handsome towers, one at the extreme sea end of each jetty—structures worthy to mark the entrance to the continent's grand water way.

Just as we passed in a great steamer passed out. Our little tow-heat looked like a toy alongside of her, the huge black hull, chimneys, shrouds and spars towering high above us into the darkness, and we knew that she extended down into the water not less than twenty-five feet. She had come over what had been the shoals at the head

She had come over what had been the shoals at the head of the passes, over places in the pass that three years ago of the passes, over places in the pass that three years in were covered by less than five feet, and was passing o over a bar, on the turn of which at Southwest Passing of Government had spent years of time and millions money in an unsuccessful attempt to maintain by dreating a depth of fourteen feet.

John A. Bioler.

THE LARGEST FISHING TACKLE ESTABLISHMENT IN THE WORLD.

ND this is Alcock's! How familiar the name! What A D this is Accock if a now laminar the name: What a host of reminiscences rise as we enter the doors—"Round bend Kendall," "Kirby," "sneck bend," "Alcock's best;" all spring up like phantom forms. Through the kindly courtesy of Mr. Alcock we were shown through the different apartments and saw the various manipulations the wire taken from the coil undergoes, until the delicately pointed, japanned hook is ready for the market. In one conver of a promption was a lorge until the delicately pointed, japanned hook is ready for the market. In one corner of a room there was a large pair of upright seissors; with a quick snap two hundred or more pieces of the required length were cut from a bundle of wire; six to ten of these pieces are taken, neld firmly against an iron bar; and an incision made with a sharp knife, for the barb. Next the filer takes each one separately with a pair of pilers, holds it in a vise, and with a few deft movements of a file, the embryo hook is pointed. Now they are bent on different forms. This is the christening period. They come forth Sproat, Limerick, O'Shaunnessy, Kirby, Kendall, Sneck Bena, Hollow Points, and Roune Points. The hardening process is the next in order. As we enter this department our nostrils are assailed by a fearful stench of burning fish oil. We would like to retreat—an instant's consideration—we decided to ignore the olfactory nerves and ment our nostrus are assailed by a learful stench of burning fish oil. We would like to retreat—an instant's consideration—we decide to ignore the olfactory nervesand keep on. Here we are shown rows of ovens, all filled with pans of burning, blazing hooks. They are kept in this fiery furnace from fifteen to twenty-five minutes, then taken and thrown into the bath of oil. We were informed and thrown into the bath of oil. We were informed they formerly used water for cooling, but now they con sidered oil the best. True to Yankee instinct, I queried why. The workman did not enter into a learned discussion on the molecular construction, or atomic properties of steel, and the consequent differentiation of the partitions of the partition of the parti

son on the molecular construction, or atomic properties of steel, and the consequent differentiation of the particles in cooling as a Boston girl might have done, but with a wise not and a firm pressure of the lips said, "The oil is the best." I thought the oil was used to keep visitors from intruding. The hooks taken from the oil are quite brittle. To remedy this they are reheated. During this process, which lasts but a few minutes, they are stirred briskly in sand.

We next visited the scouring room. Here were eight small barrels, all filled vith hooks and fine sand, revolving and turning round and round with a deafening clash and clang. In this room the worknene escaped quizzing. The noise was too much for me. Now for the linishing touches—the japanning. The japan is a black, tarry liquid made in Birmingham, the composition of which seems to be a trade secret, as I falled to learn it. Two coats of japan is applied; they are heated moderately in an oven and thoroughly mixed after each heating.

In the wateroom we are shown immense quantities of hooks all sizes, done up in packages of thousands and ters of thousands, ready to be shipped to all parts of the ward.

hooks all sizes, done up in packages of thousands and tens of thousands, ready to be shipped to all parts of the world. Here is the small delicate hook for France, so diminutive that the rude scale of inches has to be laid aside and only the French millimetre can do it justice; hooks for Canada, United States, Australia, and New Zealand triple books, double hooks, hooks flattened, hooks ringed, iks headed, and hooks eyed. All kinds of hooks for

hooks headed, and hooks eyed. All kinds of hooks for all kinds of fish.

But the manufacture of hooks is only one department of this establishment. In the yard there are stacks of cane and various wood seasoning for rods. The rods are evenly tapered with a spring and action similar to the Norris rod. We miss the delicate seven ounce split bamboo that takes the precedence in the American market. The fishermen on this side of the water are so enamoved of their heavy double action rods that none other suits, and the manufacturer must of course cater to the demand. We were shown a large variety of reels, and lines of all kinds—the old-fashioned silk and lair, dear to the heart of a Scotchman.

I might admit the flies were the best made in Redditch, but I neither could nor would grant they were equal to some made in the States. A noticeable feature in the improvements on fishing tackle are the artificial shrimp, worms, frogs, beetles of various patterns, grashoppers, and a burly humble-bee; all remarkably life-like. The spinning baits are legion in number and fine in quality. Their only drawback for the American market is the light ging and small hooks, a defect which can be very easily remediced.

Among the novelties for 1880 there is "the proper Col-

Among the novelties for 1880 there is "the proper Colorado spoon." This is the result of a nightmare on the arrival of the first Colorado beetle in Liverpool. It is a long slim white ghost, with three arms extending on each

side ready to grasp—not the potato vines but the first unwary fish. On taking our departure Mr. Alcock observes, glancing around at all the paraphermalia of the craft, "The business is all a deception." Such is life.

Redditch, Dec. 15th. Sara J. McBride.

WHEN TO STRIKE WITH A FLY .- Referring to obserawhen to struke WITH AFLY.—Referring to obserations in your issue of 5th inst. in reference to the time to
strike in fly-fishing. I think anglers will agree that it is a
matter which, in the nature of things, decides itself. I
have no experience in any other fishing except that with
the fly in fluvial waters, and although I am, perhaps, as
keen-sighted as others I cannot remember any inslance
in which I ever saw either a salmon or trout rising to my
fly in time to know whether it was in position to lie in which I ever saw either a salmon or trout rising to my fly in time to know whether it was in position to be struck. "Frank Forrester" speaks of "the eye of faith and the finger of instinct," to which I attribute the successful striking of either trout or salmon. It cannot be a matter of deliberation. You see the swirl made by the salmon, or the "flip" of the trout, and you feel that you have struck him with that instinctive movement which we call the "turn of the wrist." You may make the casting and trailing of the fly matters of careful and scientific study, but the strike is much more a matter of the domain of "faith and instinct" than of sight and deliberation.

Myzemichi. N. B., Feb. 12th.

Myzemichi. N. B., Feb. 12th.

Miramichi, N. B., Feb. 12th

Fishkill Landing.—Feb. 16th.—In your issue of Feb. 5th I noticed an article headed "When to Strike in Fly-Fishing." Now without any idea or wish of changing the theories of any one, or without claiming that my way is the correct and only one, I venture to give my experience, and think perhaps in so doing I may induce some of my more skilled brothers to give their views on the other, and is that, way we may all obtain at least way is the correct and only one, a venue to grave experience, and think perhaps in so doing I may induce some of my more skilled brothers to give their views on the subject, and in that way we may all obtain at least one new idea. As a rule I have found that the strike cannot be given too quickly after the fish breaks the water, for the instant a trout takes any artificial fly he detects the fraud and ejects it if not fastened. At times when trout are not hungry and rise lazily to the surface, they do not come with a rush, but follow up the line and suck it in. At such times the motion of the dorsal fin in the water is often mistaken for the signal, and the strike is given before the fish reaches the fly. And then, again, trout will leap clean out of the water and over the fly; at such times it is very difficult to hook them, but when the fish are hungry and come straight for the lure, strike at sight, and more fish will be fastened than by waiting for ell them on the fly. For an illustration, think of some evening when you have lingered on the stream for a few more easts until it has grown so dark that you can no longer see your flies on the water, or your fish rise, and the only signal you have is the splash as the old willy trout darts from under an old log or rock where he has passed the day in a dreamy sort of mood waiting for evening when he can come out and make his supper on the silver milter and other flies that are so unfortunate as to drop on the water. At this time in the evening how many more trout one fails to hook tham when he can strike at sight. That a trout will always hook himself, although it is very often the case, and in my opinion more of the fish taken after dark hook themselves than are secured by any skill of the angler. What say others.

The Bennel.

THE NEW YORK DOG SHOW .- The committee of managers of the Westminster Kennel Club have fixed upon April 27th, 28th and 29th as the dates for holding their fourth annual dog show in this city, and have leased the Madison Square Garden (late Gilmore's) for that purpose The premium list, which will be issued in a few days, is on a liberal scale, and in some respects an improvement on previous years. For instance, English setters have been divided into imported and native classes, and the class for red and white setters, which caused so much confusion in previous years, has been done away The show is also to last but three days, instead of four, a change which will be hailed with joy by all exhibitors as limiting the time that their dogs will be on exhibition, Mr. Chas. Lincoln has been reengaged as superintendent, and takes possesion of his office at No. 141 Fulton street (over Mouquin's restaurant) immediately. The judges have not yet been fully decided upon. The committee have written to Mr. Hugh Dalziel, Kennel Editor of the London Field, inviting him to come over and judge the imported classes, nets, etc.

Perhaps the most interesting feature of this year's show will be the colly or sheep-dog trials, which are to be held in Central Park on the sheep there on the day following the last day of the dog show. For these trials the committee will give \$100 in cash as prizes, and probably other prizes will be offered. As there will probably be no dog shows in Boston, Philadelphia or Baltimore this year, the New York show promises to be on a scale of unusual magnitude. The names of the managers of this year's show are C. DuBois Wagstalf, W. M. Tileston, H. Walter Webb, R. C. Cornell and Louis B. Wright,

NATIONAL AMERICAN KENNEL CLUB,-We call special attention to the notice in another column of Mr. Charles H. Raymond, President N. A. K. C., who, in his appointment of Mr. Charles De Rongé, of this city, as Secretary, has made an excellent choice. Mr. De Rongé is most admirably fitted for the position, being both a successful breeder and an unusually fine handler of dogs.

The conditions under which the First American Field Trial Derby will be run are also specified in our advertising columns. Later on the dates and place will be an-

FOX HUNTING IN MARVIAND.

POMONEY, Feb. 10th, 1880.

PETORE the war, in this section of the country the hunters who participated in fox hunting raised the genuine old English hound. These dogs were from twenty inches to two feet tall, with long ears, legs, head and tail. Nearly all of them were white, with brown spots. They were good dogs for a long chase, very persevering and plucky; they were often known to run all day and par of the night. We found out that they were too slow for red fox hunting, but the very thing for grays; as they were such sudden death to grays and killed hur very few reds, the consequence was we had killed nearly all the grays, while the reds were increasing very rapidly. We then concluded to breed the fox-hound with the grey-hound, to give them more speed. We find, after breeding them until we get them seven-eighths fox-hound and one-eighth grey, that they are far superior to the old fox dogs. They are not so large, are hardly ever over nine-teen inches tall, black and tan, bark plenty, and while they cannot trail as cold as the old dogs, they trail well enough for this section. They run with their heads up, very much like the greyhound, and make just the dog for red fox hunting.

Once a year all of the best does from the different ken-

they cannot trail as cold as the old dogs, they trail well enough for this section. They run with their heads up, very much like the greyhound, and make just the dog for red fox hunting.

Once a year all of the best dogs from the different kennels in the county are brought together for a big hunt. This year the 28th of January was the day appointed by our sportsmen to have a chase. By 0 colock on the evening of the 37th the men, horses and dogs had all arrived at the place from which they were to start next morning. And now the festivities of the occasion commence in earnest. There had been a bountiful supper prepared; all the young folks about the neighborhood were present, and after partaking of the repast wo adjourned to the parlor, and there made things lively by singing, dancing, etc., until the small hours of morning. At 6 o clock the following morning were in the saddle, the dogs are let out, and we press forward toward the hunting-ground, which is about two miles distant, and right on the Potomac River. Having arrived on the edge of the woods the dogs are thrown off, and after riding about a mile further one of the dogs gives torgue, the others are packed up with him immediately, but the trail is not very fresh, so we have to follow it along the river for two or three miles before we reach the dwelling-place of Mr. Reynard. But now commences the sport of the day in reality. He is up and off like the wind, with forty-live as good dogs at his heels as ever gladdened the heart of hunter. From the first two or three maneuvers he had made we knew we had jumped an artful old red. He dodged about for some time to get the start of the dogs, and then started down the river for a neck, and ran to the extreme end of it, there doubling on the dogs coming up the other side of the neck, back to where he started from, and went up the river several miles; but being pressed hard he again doubled and came back home; after trying to get away from the dogs there for some time by his cunning artfulness, and not getting away

DOSING A BOSTON DOG .- The following story is told by a young Boston physician, and is particularly pat now in connection with the article "Dosing Dogs," published in our editorial columns last week. The physician is fond of repeating the varn as an experience which confirms his allopathic principles :-

of repeating the yarn us an experience which confirms his allopathic principles:—

Like some other undergraduates of Cambridge, he was, now and then, late in getting home for the night, a fact which was regularly and noisly proclaimed by a too vigilant dog on the premises. He endured this canino officiousness for a while, but finally resolved to end the days of the vexatious animal at the earliest practicable moment. In making a canvass of his armory of destructives, he fell upon a case of homesopathic medicines, which had fortuitously come into his possession along with other inherited lumber. There were some millions of the tiny saccharine globules in little glass bottles, duly labeled, and presumably covering the whole materia medica, as well as all the regulation degrees of attention. They were emptied in a large bowl, where they, of course, presented an undistinguishable mass of sugar pellets. The dog, which was known to be fond of candy, was treacherously invited to partake, and accepted the offer without suspicion. He smelt, he tasted, and swallowed the whole mass with evident satisfaction. The nuscent doctor, who had been nurrured under homeopathic influences, was also satisfied that he had accomplished his murderous purpose. But he was mistaken. So far from dropping dead, as was expected at the end of his repast of potencies, the dog actually looked up at his order trainer and wagged his tail with gratitude. Neither did he slowly fade away and die, as if under the combined influence of buneful drugs heterogeneously mixed. No; he not only retained his vitality and nonimal vigilance uninpaired, but became the fast friend of the youth who had meant to exterminate him. It is not to be wondered it, perhaps, that an ardent and slightput out his shingle as an M. D. of the old school.

An Alpine Adventure in Massachusetts.—Sterling, Mass., Feb. 14th.—A few days ago I had to take a long walk in the storm, and had no companion but one of my friend Collins Saint Bernards. The blinding storm and deep drifts suggested Alpine dangers, and I thought to see if blood would tell. The dog was in advance, following a snow hidden footpath, and I sunk down unobserved prone on my face. A moment and he came bounding back to me and gave a low whine, but receiving no response he dug the snow from beneath my face, and, inserting his nose beneath my chin, pushed until he actually raised my head and shoulders from the snow, and repeated the operation when I, emulating weakness, bore my whole weight upon him; but the moment I stood erect he bounded off, barking joyously, car route for home, ever and a non returning—to assure himself of nay continued safety, till we reached home, So I made up my mind though

far from the home of his fathers, into whom 'twas bred, he still retained their monk-y tricks. K 9.

We have to thank the writer of the above for photograph of the fine dog referred to in accompanying sketch.

graph of the fine dog referred to in accompanying sketch.

ENGLISH FIELD TRIAL DERBY.—The entries for the sixth Field Trial Derby have just been issued. The stakes are for setter and pointer puppies born in 1879. The stakes are £100; £50 goes to the first, and the next best pointer and sketter £25 cach. The dogs will be tried on partridges in May next. The entries have closed with 128 subscribers, being eight more than last year, and including in the entries thirty-one pointers and seventy-seven setters. We give the following summary of those who have entered either pointers or setters, or both:—J. Armstrong, Edwin Bishop, Elias Bishop, J. Bishop, T. B. Bower, E. Bulled, T. Cunningham, Donglas Dunzan, Viscount Downe, Rev. S. East, Barcay Field, A. Fletcher, H. Grant, Baron von Gustedt, A. Gibbs, Daintry-Hollins, A. James, Sir Thomas Lemand, R. Ll.-Purcell Llewellin, A. P. Heyvood Lonsdale, W. Lort, F. Lowe, G. Lowe, G. De Landre-Macdona, S. Nott, G. Pilkington, T. Filkington, Major Platt, Jo A. Platt, James E. Platt, E. W. S. Popham, R. Lloyd Price, J. H. Salter, Rev. W. Shield, S. E. Shirley, Prince Albert Sohns, Sporting Dog and Field Trial Club, T. Statters, J. Todd, Messrs. Weyman & Buchanan, J. H. Whitehouse.

Kennel, Club Stud Book—Vol., H.—Entries should

Kennel Club Stud Book—Vol. II.—Entries should be made for Vol. II of the stud book at once. Blanks and information can be had of the secretary pro tem, John W. Munson, St. Louis, Mo. In nil probability the work of compilation will begin very soon, and it is desirable that entries should be in before that work begins. There are many dogs entered in Vol. 1 that have changed hands since the work was published; others have added to their winnings, and others still were entered in Vol. I and need to be entered correctly. All such should be entered again in Vol. II. It is becoming yearly more apparent to breeders and owners that a dog must be registered in the stud book to make his pedigree of any importance.

A LADY AND HER DOGS.—An old lady named Signora Lafranche, better known as the "Mamma de Cau" (the mother of dogs), has just died at Milan, and she had acquired a great notoriety in Italy through her affection for the canine race. She was so fond of dogs that she had as many as two hundred or three hundred in and about her house, and she was several times compelled to change her residence owing to the complaints raised by her neighbors. She has left the whole of her fortune to to be spent upon building hospitals for dogs in various parts of Italy.

IMPORTED NEWFOUNDLANDS.—Mr. Peter McGill, of Brooklyn, N. Y., has just received a pair of Newfoundland dogs from Halifax, N. S. The animals (a dog, Lion, and a bitch, Pet) arrived in the steamer Alhambra—the former, a noble animal, being presented to Mr. E. D. Bassford, of this city, and the bitch, who is a beauty, being retained by Mr. McGill for breeding purposes. She is to be bred

Dogs Trained.—We take pleasure in calling attention to an advertisement in another column. Mr. Smith's ref-erences are too well known to need further comment on our part as to his capability.

GREYHOUNDS.—We are informed that Mr. J. F. Grant, of Brookville, Kansas, has a fine kennel of greyhounds. Attention is called to advertisement in another column.

Mr. A. H. Moore's Kennel.—The kennel of this Phil-adelphia gentlemen, which was partly destroyed by fire some weeks ago, will be rebuilt in about a month.

Bellina Kennel.—Mr. E. C. La Montagne's kennel at Far Rockaway, L. I., will hereafter be known as the Bel-lina Kennel.

NAMES CLAIMED.—Capitain—Messes. Frank and A. J. Connor, New London, Conn., claim the name of Capitan for liver and white pointer puppy, out of Mr. S. R. Van Velzer's imported Fan, by his Sensation H. W. L. Leavitt, of Flushing, L. I., claims the names of Commlus and Remus for his orange and white (with black points) setter dog pups, whelped June 24th, 1679. These were sired by his (now Oilds) Sir Lancelot, out of Simond's Puff'; both prize winners.

Mr. E. C. La Montagne, of this city, claims the names of Dute of Austerlitz (blue Belton, seven months), and Ballyhale (orange Belton, seven months). Bellina (orange Belton, seven months). Medora (orange Belton, seven months), who was even months), but of Abby by Guy Mannering.

SALES.—Armida—Mr. Isaac Yearsley, Jr., of Coatesville, Pa., has sold his lemon and white Llewellin setter birch Armida (Leicester-Pocahontas) to Mr. F. A. Difference of the Armida (Leicester-Pocahontas) to Mr. F. A. Difference of Berkley and Dake-Mr. A. II. Moore, of Philadelphia, Pa., has just purchased from Mr. John Fottler, Jr., the celebrated brace of Irish setters, Berkley and Duke. The price is a round sun, but has not been given for publication.

SALES.—Mr. George Weddington of Grand.

SALES.—Mr. George Waddington, of Geneva, Iowa, has sold his fine setter bitch Pearl to Mr. M. A. Stearns, of Dansville, N. Y.

Bred.—Diana-Major—Mr. Pottinger Dorsey's (New Market, Md.) beagle bitch, Diana, to Mr. Wm. L. Brad-bury's (Nason, Orange Co., Va.) imported Major, Feb.

Dury s (Nason, Orange Co., Ya.) Imported Major, Feb. 11th.

Rosy-Finder—Mr. Wm. L. Bradbury's 11 inch basket beagle, Rosy, to Mr. Bradbury's 11 inch basket beagle, (Chanter-Ladybird) Feb. 11th.

Crafty-Finder—Mr. Bradbury's imported baagle bitch, Crafty, to Mr. Bradbury's imported baagle bitch, Leah-Royal Duke—Mr. F. A. Diffenderfer's (Lancaster, Pa.) Leah to champion Royal Duke.

Lady Lorne-Rhoderick—Mr. F. A. Diffenderfer's Lady Lorne to Mr. A. H. Morer's Rhoderick.

Armida-Rossoc—Mr. F. A. Diffenderfer's Armida to his stud dog Rossoc.

Lady Gip—Rattler.—Mr. E. C. La Montagne's fox terrier Lady Gip to Mr. Haine's Rattler, Feb. 7th,

WHELPS.—Daisy—Mr. Gillespie's (Goshen, N. Y.) red setter bitch Daisy whelped, Jan, 28th, ten puppies (five dogs and five bitches), by Mr. Campbell Steward's champion Duke, winner of gnn prize in New York show, 1879. Each puppy was marked with a small white spot on fore-liead. Bitches all disposed of, Katte-Glen—Dr. Holmes' Gordon setter Kate, out of Dr. Martin's Rose, Dr. Speir's Gypsun, to Dr. Aten's champion Glen.

POINTER DOG TELL.—This fine pointer has recently been aced in the stud, and all parties wishing to secure his rvices should address Aug. Bredemeyer, keeper, College Point, L. I.

Woman's Column.

JERUSALEM.

" Man's work is from sun to sun, But woman's work is never done."

"Man's work is from sun to sun,
But woman's work is never done."

HOW many times has the above quotation been audibly repeated by me since my husband became the owner of a certain piece of personal property in the shape of a pointer puppy. The quiet stiliness of a bright Sunday morning in July was broken in upon by his arrival, after a two days' journey by rail. He was gaunt and very hungry, and seemed rather reserved unless shown to a basin of bread and milk. After many consultations we named him Jerusalem, and never was a mother more tender of her child than was I in amusing and caring for that puppy for one whole week, then I began to see the other side of the picture, for I found to my sorrow he was not one of the acquaintances that wear well. He would be one of the mest affectionate and obliging creatures before my face, but as soon as my back was turned I could rely on him no more than could Ophelia on Topsy. Old boots and shoes were brought from neighboring yards to be piled upon the front door steps—bones and all manner of rubbish were unearthed, much to my surprise and mortification. Up to this time we had considered ourselves very fortunate in having water to use from a running stream just back of the bouse. Occasionally the water would be drawn down through the day, and this Jerusalem soon discovered by close observation, and would invariably wade into the black mid as far as his body would permit. It was after one of these ablutions that I found him one afternoon, very comfortably lying up in the baby's carriage where her white cloak had been left for a short time. You can imagine my exclamations and gestures and frantic endeavors to get him out and secure the cloak, which very much resembled a mop, and while viewing it at arm's length wondering what to do, my attention was attracted toward the house, and there through the open doorway I saw seated very quietly in my best upholstered chair, that animal. Rushing at him I very indignantly caught him by the maps of the neck and hurded him into the midd

P. S.—This Jerusalem is the "Shot" my husband wrote you about same time since, and you answered us through your correspondents' column that for his rheumatism I should give him half-teaspoonful of soda three times a day. I have followed your instructions and the pup is better of it, but is yet somewhat hame. Since writing you for advice we have thought that his rheumatism may have been caused by being in the water so much last summer. The Genesee River runs across the back end of our yard, and the little fellow used to be playing and swimning in the water a great deal there until cold weather set in. If this is the origin of it we may never be able to eradicate it from his system. He will be nine months old the 20th of ### the present month, and is full of life. He has his growth very nearly; now weighs sixty pounds and measures twenty-eight inches around the clast.

GAME SLAUGHTER TWO HUNDRED YEARS AGO.—The grave of an Indian apostle, St. Acpinquid, is on a high hill at York, Me. He was converted and passed fifty years in preaching to the sixty-six Indian tribes of the country, and died on the 1st of May, 1663, at the ago of ninety-iour. His funeral was conducted with great pomp, and the Indians sacrificed 25 bucks, 67 docs, 3 eranics, 32 buffaloes, 110 ferrets, 822 martins, 320 works, 82 wildcats, 483 foxes, 620 beavers, 500 fishes, 90 bears, 36 moose, 50 weasels, 400 otters, 520 raccoons, 112 rattle-snakes, 2 catamounts, 900 misquashes, 69 woodchucks, 1,500 minks and 68 porcupines.

Archery.

MR, THOMPSON'S LETTER TO THE NATIONAL ARCHERY ASSOCIATION,

CRAWFORDSVILLE, Ind., Jan. 26th.

T the Officers and Members of the National Archery Associatio

In response to the proper official call, you have met in order, by your delegates to consult regarding preparations for the second annua National Tournament.

The grand meeting at Chienzo last year was a marked and theerng success. Dyreference to the history of the English national
meetings it will be seen that our champton medal was won by a
much higher score than that which stands opposite the first Dritish

Our next national meeting will, I think, surprise the archery world, not especially perhaps by very high scores, but by the large number of good scores. From reports of private practice coming in from every divection I am led to believe that the score made by our champion last year will be [equalled and passed by many archers at our coming meeting.

I am especially glad to report that lady archers all over the

I am especially glad to report that lady archers all over the country are enthusiastically advocating and practising the longer ranges; and I would recommend, in order to make our meetings uniform with those of England, the adoption of the "National Round" of Great Britain in place of our "Columbia Round." One of the special features of our first meeting I should be glad

One of the special features of our first meeting I should be glad to see retained, viz., the Team Contest, with the modification of dropping the two shorter ranges and confining it to a fixed number of acrows at sixty yards, or sixty and eighty yards. It ought to be the aim of our Association to especially foster and encourage long rangeshooting. An interoalional contestwith English archers is a probability of the near future, and we must meet them at the York Round.

It is a gratifying compliment to our efforts toward making the refined and healthful passium of archery a national one, that other associations have followed in our wake, in the East as well as in the West. Consequence of the West.

It is a gratifying compilment to our efforts toward making the refined and healthful pastime of archery a national one; that other associations have followed in our wake, in the East as well as in the West. Let us extend every courtesy and encouragement to these sindred organizations, to which end I suggest the propriety of a change in our constitution, admitting to our annual contest any American archer in good standing who shall pay the fee required, no matter to what association hem yelong. I think we ought to see that in adopting such a rule the English National Association bas taken a step far in advance of our exclusive policy. Our object should be to extend our influence by a liberal management. Great care should be taken not to array the National Association against the locat organizations, but, on the other hand, our lines should be drawn so as to treat all archers alike.

They to return my thanks to all the officers and members of the National Association for their many courtesies and pleasant favors during the time I have served in my present capacity, and to wish them a happy season for 1880. MACRICE THOMPSON.

SHALL WE CHANGE OUR SYSTEM OF SCORING

WE HAVE never been accused of undue conservatism, but have always looked carnestly into any proposed improve ment, and have always desired to adoptite or reject it solely upon its merits. When the discussion began in this country, some months ago, with reference to the propriety of changing the plan of secoring in archery target shooting, although the bare mention of such a thing produced a sheek of a stonishment, we determined to investigate the matter thoroughly before deciding to advocate or combat the proposed change.

The first objection to a close, which presented itself to our mindant which is certainly a serious one, arises from the confusion which would be unavoidable for a long time in comparing scores made this year and hast year with those inade after such change. While it is in theory a very easy matter to bring scores recorded in the present style to the basis of 1, 2, 3, 4 and 5, in practice it is a very difficult thing to do. For instance, to choose at random from the score-book of the writter ascore of twenty-four arrows at skirty gards, shot on the 10th day of September, 1879, at the present regulation four-feet target, three arrows at an end the details being as follows:

the details being as follows:7 7 1-5 5 7-7 3 3-3 5 5-5 7 1-5 7 7-3 1 3-5 1 5-108

Now, in order to reduce this secrete the proposed basis it would be necessary to reduce each red (no golds were made) three points, each blue two points, can't blue two points, and count the whites just as now. Should the score, for instance, be 44 arrows at any range, this reduction would be a tedious thing. A greater trouble would exist in the fact that scores have been and always would be reported simply thus (for the above)—Hits, 24; score, 168. So the reduction would become at once impossible. Now the chief value of reported scores consists in the possibility of readily comparing our scores with them and noting the comparative skill of different archers and the improvement or retrogression of each. If this comparison is difficult, few will take the trouble to make it.

But for argument sake grant that in a year or two all American archers could be brought to think that their old scores, registered after the present style, were of no particular value as matter of reference. Yet the pleusure and value of comparing our scores with those of our trained and wonderfully skillful cousins in Great Britain would be, ask such skillful cousins in Great Britain would be, ask such skillful and enthusiastic archors as Maurice Thompson, H. C. Carrer, Frank Sidway, The Hussey, E. T. Church, Dr. E. B. Weston, John Worcester, John A. Booc, Taco, Mcelchan, Geo. T. Henry, L. L. Peddinghaus, J. D. Patierson, E. W. Deval, and a bundred others of the most skillful and studious toxphilities of this country, whose names I could give. To the beginner who confines his practice to ranges of from thirty to fifty yards no such considerations weigh, because in possibility of such comparison exists, because of the English practice for gentlemen being never at less range than sixty yards, and for the indies never less than fifty yards. But just so soon as the genuine lover of archery attains to such skill at images of sixty to no hundred vards as opens to his eyes the rarer beauties of the pastime, he begins to compare his scores with the veterans of the isles. There is food and nourishment in it. "We grow with that we contemplate," and the study of the achievements of such magnates of the bow as ford, Braumball, Spottiswoode, Maitand, Moore, Holmes, Pisher, Patalaret, Himington and Everett, will do move than any new system of scoring to bring the archer to the front rank of the volaries of the bow.

But even if this difficulty could be overcome, or if it were conceded that we have no particular reason to compare our scores with those of the grehers of Britain, we next look to the proposed

benefits to be derived from such a change. If there are any really good reasons to change our gold value to 5, and the other colors ranging down to 1, what are they? Several earnest archers, who, no doubt, have only the good of the pastime at heart, have lately written for the FORDER AND STREAM YETY intercesting articles u run the subject-ramony them Mr. A. S. Brownell, of Boston; 1, ... A. W. Havehs, of Sau Francisco, and a gentleman signing himself "T. R. W."

A careful investigation of the different objections to the present system, and the arguments in favor of the new system.

A cureful investigation of the different objections to the pres-sent system, and the arguments in favor of the new system urged in these letters, develops the singular fact that some of the strongest objections to the present system pointed out are argu-ments directly against the theory of the gentlemen presenting them. Mr. A. W. Havens, of San Francisco, in his article in the Present of Present of the Stellar Section (1) the second them. Mr. A. W. Havens, of San Francisco FOREST AND STREAM of the 5th lost, says: 'I claim that a scor COME AND SIKELANGE THE SER 10ST, SAYS: "I Claim that a score of 200 made up of blues and reds is better than a like score made up all the way from white to gold. I claim, further, that the blue and red man is a better archer than the other, and should be entitled to as much consideration in the matter of system of counting." All this for the purpose of showing that the gold has Yet the fact is that the exact op-bave the advantage all on their an undue proportionate value! Yet the fact is that the exact opposite is true. The red and blue have the advantage all on theft
side. The archer who, as Mr. Havons says, "makes up his scores
of blues and reds," instead of boing placed at a disadvantage, is
vastly benefitted by the present system of scoring. For instance,
should two gentiemen shoot thirty arrows, and one strike with
fifteen arrows in the red and the other fifteen arrows in the blue
havould score 180 points. Should his adversary's score be "made
up all the way from whites to golds," "it would rue thus 16 whites,
8 blacks, 6 blues, 6 reds, 6 golds, or 150 points, giving the
"blue and red man" the very advantage Mr. Havons claims he
"blue and red man" the very advantage Mr. Havons claims he
"blue and red man" the very advantage Mr. Havons claims he
"blue. But in practice he wanted have a vactive researce." an undue proportionate value! should have. But in practice he would have a vastly greater ad-vantage than is shown by the above camparison, because the gentlemon whose scores were made up of blues and reds would in practice get his hits (fastead of 15 reds and 15 blues); thus: reds. in practice get us into disteau of to reds and is blues; thus: reds. II; blues, is jescen, 172. While the one who scored "all the way from while to gold," would get bis score thus: Golds, 1; reds, 4 blues, 6; blues, 6; blues, 8; whites, 11; score, 102. Of course, every score would not show the same proportion of the different colors hit, but in theory it should always be so, and in practice wherea large number of scores, say one thousand scores, should be shot, the suit would be about as indicated. This comes from the relativ areas of the different colors, each being (without counting frac-tions) as follows: Gold,72 square inches; red,217 square inches; blue 382 square inches; black, 506 square inches; and white, 651 square inches. Further, in making the above calculation Mr. Have theory has been given the advantage of some fractions. A teery was oven given the advantage of some fractions. A fur-ter advantage in practice i possessed by the poor, hampered red and blue man" in the fact that since some arrows of each moster will miss the target entirely, the "blue and red man" will suffer least, because one who can shoot so regularly as to get all his hits so near the center will very seldom miss the target, while the shooter whose hits are scattered from center to circumferse a great many arrows.

The writer in treating of the proposed change has also will le

The same writer in treating of the proposed change has also said: "It frequently happens that an archer will make fewer his than his opponent, and still get away with him." This is very true, and would still be true with the system proposed or any other system of scoring from a graduated target. If this were not so, there would be no use of giving values to the colors at all. If the gold is valued at 5 and the white at 1, the rule still holds good that one archer may make more hits, and get less score than his component.

ns opposent. Mr. Brownell, in Forest and Stream of Jan. 15th, says: "Ti being a possibility of a chance gold counting more than two blacks and two whites, I submit that chance may carry off the backs and two wates, I submit that chulled may carry off the palm against meeth." He might have put if a little stronger, and said a chance gold would outscore eight good whites; and yet, though this be true, the gold and white, as they nowscore, are in exact proportion to each other—the area of the gold being 72.35 inches, and that of the white, 63.44 lockes; so that if we depend inches, and that of the white, 63.44 lockes; so that if we depend entirely upon chance we will average nine whites to one gold. The red, blue and plack are not properly proportioned in the ses singularly enough these are the colors which are supposed to need some special legislation in their behalf. The value of each color in the proportion that they should actually have is as follows: Gold, 9: red, 3: blue, 1.8; black, 1.3, and white, 1—calculated only singularly enough these are the o to the nearest one-tenth. Now scores kept upon such a basis would be in theory perfectly fair, but in practice the same trouble would arise in an aggravated form. Thus one gold just inside the margin would equal three reds, each located within a half-inch of the gold. Yet who would think the first score equal to the last? No doubt the archers who framed our system of scoring took all this into consideration. Another very imports scoring took all this into consideration. Another very important matter seems to have escaped the attention of the critice of the old system; that is, that no graduation of values is correct for more than one particular distance. To illustrate, suppose two compelliors shoot a wenty yards at a regulation target, thirty arrows each; he would be the most accurate and reliable archer that ever lived who should seore 30 consecutive golds. His adversary would be a mere muff, and worthy of no sort of commendation, who scored 15 reds, 15 blues, and failed to touch the gold; yet the perfect archer who might put every arrow in the exact courted of the gold variety seems. penter of the gold would only score 270 to his apparent's 180center of the good would only score 200 of its opportunit's 189—only 30 points in 570 ahead; and yot the guilf would be one which no human life is long coough or human skill great enough to overpass. But suppose the targets are placed one hundred yards apart; now the white and black rings, which at thirty yards were useless, come into play. At short range they were not needed, at long range they are. One who hits the blue at one hundred yards feels the same elation that he does who scores a rei; yet afforty yards the red is accounted a fair shot and the blue a poor In other words, as the distance is increased the target should be enlarged, so as to keep the proportion true. Should two competitors shout at five yards, and one score still his shots pin-hole golds, the other all golds also, but averaging all over the surface of the gold, each would score the same, for one be a hundred times as skillful as the other. The gold is too large for five yards, and not large enough for one bundred yards. At seventy-five yards it is about right, A little thought will convince any one of the utter impossibility of graduating values for the target colors so as to prevent, or measurably lessen, the effect of chance without charging the very elements of archery. For instance, in should be enlarged, so as to keep the proportion true without changing the very elements of archery. For instance, in the plan proposed by Mr. Brownell and others, two archers shoot one hundred yards, one arrow each, for a prize. One strikes with one inhulud yards, one arrow eneet, for a protein Conservation in the black, but at the extreme outer edge of the that color; the other strikes in the extreme inner edge of the wine separation are just touching, only a maginary line separating them; yet one scorest twice as much as the other. Now this is all vorbing, the totalk about in theory, but in practice it amounts to nothing. It to task about in theory, but in practice it amounts to norming. It is true that very frequently the scheen who makes the greatest number of hits gets beaten in score, and it is nearly always the result of the poor shooting condition of the archer who scores low in value to the hit. If a first-class archer is shooting at sixty yards with a third-inte archer, the expert being feeble, nervou

and out of form, while the poorer archer is in good condition, the result will be that the expert, by reason of his knowledge of his result will be that the expert, by reason of his knowledge of his weapons, perfect judgment of clevation, his power to loose "evermore alike," and the knowledge of the minutle of his craft, will get all his arrows within the general circumference of the target but will from his unsteadiness and feeble nerve drift all over its surface, and his hits will run low in value. On the other band, the poorer shot being in fine condition, will hold with utter steadiness, will get sometimes three or four splendid hits in succession : but from less knowledge of the small points in archery he will sometimes get a false loose, or he will draw his right hand a little too low or too high, and will miss the target several feet. He will get fewer hits but more score than his accomplished adversary. Every archer who has practiced a great deal will remember how better his hits have counted on some days than upon others A study of himself will show the cause to be not in the target, but in his own physical condition. The writer on the second day of the grand national meeting at Chicago, with seventy-two arrows at a hundred vards, scored 42 hits, 130 score. Never before or since has he scored that number of hits without getting at least the result was wholly due to two causes—physical feebleness and the nervousness attendant upon a great public meeting. This defective shooting was not only exhibited in the hundred yards work, but equally so at the other ranges. With 39 hits at sixty yards he scored only 155, when his usual score to the hit before that day had been between 5; and 6. The element of chance cuts that day had been between 54 and 6. The element of chance very little figure in our scoring when any large number of rows are shot. As between two archers who each average 20 bits out of 24 shots at sixty yards, the element of chance is of no moout of 21 shots at sixty yards, the element of chance is of no mo-ment; and fift were it cannot be guarded against. My Mr. Brow-nell's system the hit in the red would be worth four-affths as much as a pin-hole gold, when any part of the gold is just three times as head to hit as the red. Of course the same defect is in the present system of scoring, but why fly from present ills to those we know not of? As before shown, even if the rings were given their just proportionate value, no real benefits would ac-

Archery has been studied in Great Britain by learned and enthusiastic votart and any analysis of years. During the last thirty years it is reached such a state of perfection, that gentlemen have shot be, or at one hundred yards than any of our, flow best shots have averaged at balf the distance. Ladies, at great public meetings, have, with twenty-two-pound bows, at sixty yards, made 90 consecutive hits; and, on one occasion. Miss fletham scored 432 at the single National Round, of forty-eight arrows at sixty yards, and twenty-four arrows at afty yards, and twenty-four arrows at afty yards, and the single National Round, of forty-eight arrows at sixty yards, and treathy-four arrows at afty yards, and the single national Round, of the proposed that they have let the centuries go by without most thoroughly discussing this matter? Can it be possible that they would be so matchiessly cunning in the construction and use of this most difficult of all weapons to conquer, and yet not see these glaring defects which appal us now? On the contrary, they early found that if the rinss of the target were made of the width we give them, that the white must count one, and the gold nine to be in exact proportion to each other. Then since it would be awkward to give any fractional values to the other rings, and slace a regular graduation which we now have. Of course the difficulty might have been avoided by first choosing the representatives of value, say 1—2–3—4—and 5, and so graduating the sizes of widths of the rings as to have made the just proportions; but a target with a gold of 26 inches in diameter, and the red ring of only 2.4 Inches in walls, would look a widwardly—and yet the proportion would be right in practice; but how would it do at ten yards? The English found in so on the trange where this proportion would be right in practice; but how would it do at ten yards? The English found in so other showed the foolishness of this, at any ranges greater than differ yards, and it ceased.

any ranges greater that may yans and it cases.

We Americans are a queer people. We don't want to do anything like an Englishman, even if he is right. The writer does not claim to be an exception to the rule. When he began target practice, he would shoot two hundred and eighty-eight arrows in n afternoon! afternoon! Major Fisher toto him a warning letter, but he tiled at the idea of the shooting of any number of arrows injursmiled at the near of the shooting of any number of arrows injur-ing him! He used a sixty-five-pound snakewood bow, and laughed at the well-accant advice of that glorious old voteran of sixty years' practice—Peter Muir—who wrote him to use a forty-sixbound yew. He praised a snakewood as being the par excellence of hows, despite the unanimous testimony of the archers of Great of lows, despite the manimous terminally of the archers of treatment of the Britain, that no bow approached a yew in every desirable quality. He stoutly maintained that the best loose, was that which gave the lowest trajetory with the same weight of weapon, despite the fact that the greatest archer who ever touched a string declared against him. To all these, and many more erroneous opinions anst nim. To all these, and many more erroneous opinions, clung with true American pig-headedness, until bitter ex-rience upon each and every point forced him to accept the oth. So with his former style of drawing to the ear (instend of under the chin, as the Euglish do); of shooting without aiming over the end of the arrow; of allowing his string to strike his arm-guard, and many another grievous errors. So our embryo American archers are now about our style of scoring, for we are arm-guard, and many another gravous errors, so our embryo American archers are now about our style of scoring, for we are all but tyros yet. We think we see a grievance when there is none and be it enemy or wind-mill, we at once charge! Mr. Brownell even thinks that the archer who shoots big arrows has an adwith thinks that the artest who shoots a small one. If that he so, let the other fellow buy him some big ones! But he will make a mistake if he dues. The arrow which is of the right worth and sufficiently rigid, is all the better by being small. Now all this friendly criticism is not for the purpose of answering somebody, but solely criticism is not for the purpose of answering somebody, but solely for the purpose of saving archers from the mistake of changing that which does not need change; which would work as badly after changed as now, and which would lead to confusion and difficulty. Mr. Havens says that it is very desirable to come to the 1, 2, 3, 4, 5 method of scoring, because rildmen have adopted that system at Greedmoor, and throughout the country. The rildmen, however, do not shoot at a target which even resembles ours, their long-range Creedmoor targets having a bull's-eye of three feet diameter, while the other rings are not at all proportional like ours; and finally their counting surface goes off into the form of a rectangle. If any change is necessary to enable the riflemen and us to score alike (and no such emergency exists), let rhiemen and us to score ainse data to such charged crists), for them come to our scoring. Our system of scoring was old when the Indians owned the Greedmoor marsh. To the riflemen who want to know why we don't adopt their system of scoring, we may with propriety answer, after the manner of the urchin who asked by the minister why he was hallooing while he, the was assed by the infinited my few was manoning with the left the minister, was going by, while he was halloning?" We occupied the score ground first, and adopted as good a system as they. Let us not abandon it now, and chase a phantom.

Washington, D. C.

I know the gentlemen who are urging the change are earnest and thoughtful men; but if they will let our score system alone and following study archery one year more, they will not then desire, the change is the most change is the change in the change is the change in the change is the change in the change in the change is the change in the change in the change in the change is the change in the change of chance we will be better archers. We all meet our competi tors before the same target, under the same circumstances, is afraid of chance?

WILL H. THOMPS WILL II THOMBSON

New Your Anguny Cittle -The Saturday evening meetings New York Archery Clurk.—The Saturday evening meetings for practice of this club are increasing in interest, a large num-ber of spectators witnessing their shooting every week. They have had representatives also from the Brooklyn Club; Oritani Archers, Hackensack, N. J.; Ascham Archers, Brocklyn, E. D.; and North Side Club, Chicago, III., all taking an active part in the shooting.

the shooting.

In securing the armory of the Ninth Regiment, where they are, the club did a skillful stroke of business, causing an increase of interest among their own members as well as of those interested in the royal game outside of the club. The return match with the Ascham Archers is spoken of to take place Saturday evening, Feb. 28th, at the armory. The regular monthly meeting will take place Wednesday evening, Feb. 28th, at the residence of the Secretary, Jas. W. Auten, Jr., 339 West Thirty-second street.

BROOKLYN VS. ASCHAM.—The return match between teams of BROOKLYN VS, ASCHAM.—The return match between teams of the above Brooklyn Archery Clubs took place this week at the Archery Hall, Division arenue and Clymer street, Eastern District. The Ascham team was in command of Capt. Chapman, and the Brooklyn under the supervision of Capt. Hoyt, Mr. Manderville, of the Ascham, scoring for the Brooklyn team, and Mr. Pearsail for that of the Aschams. The distance was 30 yards, and each team shot 50 arrows in rounds of 30 arrows for each contestant, each round consisting of 10 each of 3 arrows each from each bow of the team. When the last round had ended the score was for mit the use follows: each bow of the team. Whe

 He nose is warm and dry; appetite good. What shall for him? Ans. Administer three drop doses of the three of the company o C. A., Washington City.-Please tell me what to do for my seite small ite three times a day in teaspoonful of water. four days, discontinue for two days, and renew if sympto vail until cure is effected.
- N. C. L., Salem, Mass.—What will prevent my dog from snapping his ears, and rolling his head violentity? He has sores on the end of his ears. Ans. Your dog has external canker. Weak mercurial ointment should be applied once a day. The a cap over the dog's head to prevent him from scratching and shaking his ears. Be careful to mix vegetables with the dog's diet. Give ts; half an ounce in eight ounces of water once a week Write result

W. E. W., Phila.—My setter bitch, nine months old, has been infortunately lined by my old setter. 1. Will this interfere with tergrowth? 2. Will it break down her constitution, and interfere nergrowth? with her working qualities in the future? Ans. 1. Most probably. 2. Not necessarily, but do not breed her again for over a andy. A Not necessarily, must not offer the again for eyer a consideration should be served until she has fully matured and is eighteen months or two years old. The average breeder is in too much of a hurry to raise stock.

J. J. A., Lawrence, Mass.-My setter, two months old, does not 1. J. A. Lawrence, anisk—My serier, two months on, goes nor seem right. He is lively as can be out of doors, but when in comes inside he seems rather drowsy. His cont is dull, eyes heavy, nose rather dry, and he sprawls himself on the floor at full length; jerks and trembies in his sleep; his appetite is poor. Ans. Try teaspountial of salt dissolved in water, several times a Ans. Try temporate of sain baselies in waters several times a day. This can be poured down the dog's threat. If relief is not found, then give doses of five grains of eniomel, repeated twice within twelve hours, followed by small doses of easter oil six to eight hours after.

J. J. B., Canada, -2. Which is the best adapted breed of dog for

grouse, quail and woodcock in Canada? 3. Some time since we heard that a cross between a pointer and a setter was recommended? 4. Where can a good dog be obtained that has a fine nose and will work well, price reasonable? 5. Will there appear any articles in your paper on the working of dogs in the field?

Ans. 2. Either a setter or pointer. 3. The cross between a nointer
and a setter is called a dropper. They are at times excellent dogs.

4. A really good dog is a rara aria, and will command a good price. We must refer you to our advertising columns. 5. Yes.

of the series will be on the handling of dogs on English snipe.

D. McG., Rutherford, N. J.—See answer to "J. T. P., Va.,"
in issue of Jan. 23th. It will inform you about fox-hounds. The
dog you refer to is the dachshund, or teckel. The seeming power of these dogs is said to be very good. They are chiefly used in Germany for hunting the badger, whence the name. The ferret Germany for number to sugger, whence the name. The error is a native of Africa, but has been domesticated in Europe, where they are used for driving rubbits out of their holes in the warrens. In this country they are used principally in rutting. They are always muzzled when being handled, which prevents their extehing the animal hunted for, sucking their blood and going to sleen in the holes

sleep in the holes.

G. A. R., Cleveland, Ohlo.—Will you please give through the columns of your valuable paper the names of some of the principal books on the birds and mammals of North America? Also, paths of the columns of North America? please state where they can be bought. Ans. Birds—Coues' Key to the Birds of North America, Birds of the Northwest, Birds of the to the Birds of Aorth America, Birds of the Northwest, Birds of the Colorado Valley; Baird, Brewer and Righway, Birds of North America. These are the most recent works on birds. Mammals—Audubon and Bachman, Viviparons Quadrupeds of North America (Lockwood & Co., New York); Coues and Allen, North American (Lockwood & Co., New York); Codes and Alein North American Rodeutia; Codes, Fur-Bearing Manmals; Jordan, Mannal of Vertebrates. For Audubon write to Lockwood & Co., New York; for Jordan's Minual to Jansen, McClung & Co., Chicago, Ill., and for Codes' works, to Dr. Blifott Codes, Smithsonian Institution,

Washington, D. C.

J. Baltimore, Md.—My pug-dog (age not stated) for some time
past has been passing blood at intervals. I have on several occasions given worm medicine and followed it with a dose of castor oil and generally he comes around all right, but it is only for tor oil and generally be comes around all right, but B. Is only for about a week, when the trouble returns. I have not seen that he passed any worms after my treatment. His coat is in bad condition. If you can, advise me what to do for him? Ans. Your dog probably has congestion or chronic inflammation of some portion of the intestinal track. Give small repeated doses of castor oil and laudanum, small teaspoonful of the former to one-half teaspoonful of the latter. Repeat once or twice a day until realief is found. Number of doses to depend on the severity of supports.

symptoms. Sport, Torresdale, Pa.—My red Irish setter has a large lump SFORT, Torresdale, Pa.—My red Irish setter has a large lump on his throat; it does not seem to frouble him. He eats well and seems to be in good health. I first noticed this lump a few days ago; it came all at once. The hump is hard and not tender to the touch. Ans. You have neglected to state the exact position of the lump, whether it is in between the angles of the lower jaw-bone or back of the law-bone behind the car. You had better, however, elip the hair off the part affilied and paint the swelling with tincture of iodine once a day for a week; to prevent the dog from scratching the tumor, tie a carpet apron around his neck, which will cover his shoulders, and give him two grains of iodine of notassium wices a day, we hours before feeding. Feed liber.

which will coyer his shoulders, and give him two grains of loans of potassium twice a day, two hours before feeding. Feed liberally and allow plenty of exercise. Let us hear result. KENO, Pratice, Miss.—I. What is the difference between a cocker spaniel and any other spaniel? 2. What are both good for? 2. Are they both land and water dogs, and are they first-class bird dogs? Ans. There are different varieties of the spaniel, the most common of which are the cockers, King Charles, springer. most common of which are the cockers, King Charles, springer, black and tan, Blenbein, clumber and water spaniels. At the last New York bonch show three classes were exhibited, namely, the Irish water spaniel, clumber and cocker, or field spaniels. The cocker is distinguished by being the smallest of the land spaniels. 2 and 3. The spaniels can be divided into two classes—land and water dogs. The former nor used for flushing game, and the latter for retrieving wild-fowl and water blids. Cockers are much

water dogs. The former are used for finshing game, and the latter for retriving wild-fowl and water birds. Cockers are mush used in England for both woodcock and pheasant shooting. Mr. M. P. McKoon, of Franklin, Delaware County, N. Y., has some celebrated dogs; we will give notice of them next week.

W. P. S. and F. M. R., Indianapoils.—We are two boys aged eighteen and uineteen, both engaged in business as clerks. Our fathers offer us together \$3,000 to so out West into the cattle business. Both of us are utterly ignorant of cattle and farm life, and hesistic out that account. Which would you advise us to do, go or stay? What fire-arms would you advise us to bo, go or stay? go or stay? What ure-arms would you avoice us to procure for hunting game? Ans. Take \$200 of your money and go out to see for yourselves. You cannot expect to make cattle-raising or anything cles a success without first learning something about it; nor is capital the only requisite. Success in any undertaking depends so much upon a man's individual charactor, energy and good sense that it would be hazardous for utter strangers to good sense that it would be hazardous for utter strangers to venture such advice as you ask of us. Scores of fortunes have been made in the cattle business, and scores of men, too, have failed. If after your trip of inspection you decide to embark in the business, you will probably have learned by that time the necessity of serving an apprenticeship in it. Take a rifle if you wish to combine pleasure with business.

PUBLISHER'S DEPARTMENT.

To Preserve Flowers.—A good way to keep cut flowers fresh is to lay them in wet clothes. Take them out of the vases at night, sprinkle with cold water and then wraptl em in cloths made very wet with cold water. The weight of the cloth will not crush the most delicate flowers, while it keeps out the air, and prevents their falling to pieces or opening still more.

To preserve health use Warner's Safe Remedies. These

To preserve health use Warner's Safe Remedies. These are almost of miraculous power in removing diseases for which recommended. The wonderful curative qualities they are possessed of is vouched for by tens of thousands, —[Adv.

A few hours of time and an expenditure of a few dol-—A few hours of time and an expenditure of a few dollars in setting out slade and ornamental trees will amply recompense him who plants them. Some of our New England villages have of late years organized village improvement societies for tree planting and otherwise beautifying the public streets. The example thus set is well worth following. We commend to our friends the notice to be found elsewhere of the Babylon Nurseries.

Good Evidence.—When such nen as the Rev. Dr. Rankin, Rev. D. Harvey, Prof. Green. Dr. Burline, Col. John K. McChesney, E. W. Neif, and a bost of others equally trustworthy, certify over their own signatures to the marvelous efficacy of Warner's Safe Kidney and Liver Cure, in the diseases for which it is recommended, it is time to dismiss doubts on the subject. [Adv.]

A WEEKLY JOURNAL.

DEFOTED TO FIGLD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INQUICATION IN MEAN AND WOMEN A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

Constitutions of Clubs .- We are in constant receipt of letters inquiring for forms of a constitution and byelaws for sportsmen's clubs. We shall esteem it a favor if clubs will transmit to us copies of their forms. Their dissemination extends the good cause.

-The recention accorded the President of the New York State Association for the Protection of Fish and Game upon his recent visit to this city was highly gratifying, and gives evidence that the sportsmen in this eastern section of the State are rapidly increasing in num bers and are coming to take an interest in the affairs of the State Association. It has taken several years of persistent labor on the part of a few individuals to teach the sportsmen of this vicinity that there was a solid organiz ation in the State, and that it has already held twenty one annual conventions, each one of them superior to those before it. But now a sudden change has taken place in this respect, and when Mr. Silsby, the President of the association, came here, it appeared that the clubs of Long Island could not do enough to show their appreciation of the Association and in making his stay agreeable. An impromptu banquet at Mouquin's, drives and reception were the order of the day. The Kings County clubs will be well represented at the Seneca Falls Convention, and they are all working in barmony to that end. In their fellowship and concert of action they are setting an example worthy of imitation in every section,

"The older I grow," writes "Ned Buntline," " the more I love fishing, for I can wade streams easier than I can tramp over land in search of game." Angling is the gentle craft ; par excellence the employment of a quiet day. Men may angle when they may not shoot. tramp over the fields and through the woods with gun and accoutrements presupposes a certain superabundance of vigor. It is the fit sport of the young man whose glory is in his strength, and of those who are in the prime of life. As men grow older they forego the tramp after game and go out more often with rod and reel. The angler's passion never ccases. An old man finds in the solitude of the streams a fit scene for living over his life again in the memories which there gather about him, playing in and out with the shadow of the leaves and the flashing of the stream.

JUDGES AND THEIR CRITICS.

WITHIN the last few months, and noticeably immediately after the inaugural of the Eastern Field Trials, we have been in receipt of a batch of letters from parties requesting us to write scathing articles on the judges and their decisions. Applicants have also appeared in the body, who have urged and endeavored to persuade us to take up their cudgels and smite in a backhanded, covert kind of way the gentlemen who did not decide in favor of their friends' dogs. As yet, however, no winner has put in an appearance or written us abusive letters on the subject, so that we presume that to a few, at least, the trial decisions appeared to be just and correct. If they had been otherwise we are sure that there were gentlemen who were recorded as winners who would have been as ready to disclaim any errors of judgment or partiality regarding their dogs as the friends of the owners of animals that were beaten.

Really, matters are getting so bad, both here and in England, that it seems that there cannot be a bench show nor a field trial without the sporting press being for weeks afterwards flooded with communications from the large army of unsuccessful competitors, the poor judges being the bulls'-eyes at which they aim. It therefore appears to us that a continuance of this course will, within a short time, deter, in a direct and indirect way, if it has not done so already, the very men who are specially adapted to stand as judges—in what may now be termed the annual sporting pillories. As a relief for this we occasion ally hear it said by those of the broad-brim persuasion "that the only way so save this trouble is to award each entry an equal prize." This ingenious method, however, is not the remedy we would suggest for stopping what is vulgarly called "kicking," It is to be presumed that every one that places his ani-

mal in a bench show, or runs him in a field trial, is aware that the dog is intended for competition, and that there are to be judges to pass on his merits and failings. That the exhibitor should know the names of the judges is of paramount importance. Once knowing their names he can determine for himself whether they are fitted for the position or not, and whether they will be perfectly unbiased in their decisions. If he resolves that they are not he should not enter his dogs, there being no obliga tion for his doing so. But if he does enter his animals he thus accepts these individuals as fit persons to judge his entries, and thus binds himself to abide by their judg ments. If ther he adopts the latter course finds too late that he has been wronged in a willful manner, he would show more spirit, good sense and manliness, by quietly submitting to the injustice which he has no power to remedy, and ever afterwards refusing to enter his stock in any show or trial conducted by the same management.

In all sporting matters the duty of the judges is an onerous and an extremely thankless one, and a most liberal allowance should always be made for contingent errors. At the same time, however, it should be borne in mind that there is a vast difference between errors of judgment and intentional wrongs. We mark this distinction because we notice that correspondents of the "kicking" class usually begin their epistles in an incoherent tone, alluding to the mistakes of the awards, when they really point to supposed wrongs that have been done them, and, as is often the case, they wind up with direct charges. Undoubtedly there are at times just grievances, because in all sporting matters incompetent persons will be selected to fill the high offices of judges and umpires. Take, for instance, the old English game of cricket, and it is found that the only proper person to umpire the game is one who is a practical player himself; he must be this; but it is not because he is a crack player that it fits him to decide the points of the game : he must be something more. Thus on the same ground, because a gentleman owns half a dozen good dogs and is a rare good shot, it is no reason why this fits him to stand alone and judge the working of a number of dogs at a field trial. The only man who is really worth a rap for the position of judge in the field is one who has made shooting over dogs in all sections of the country a life-long study. What does an old woodcock shooter who has never been out of the cover of his county know about dogs that have been handled only on prairies? Is he a fit person to lay down the law? And yet he may excel in the cunning of that branch of his craft. No, he is no more fitted than the prairie sportsman is to judge the most killing cover dog ever littered. Therefore, to sum the matter up, let gentlemen of universal experience fill the list of judges; their names should be announced when the entry roll is open. Then will the exhibitors commit themselves morally, and either courtesy or a sense of shame will oblige them to quietly abide by the decisions of the judges whom they have practically accepted. All this will then tend to make shows and trials more popular, and exclude from both the bane of all true sport, the chronic grumbler.

We commend to Professor Elliott Coues and other anti-sparrow partisans the experience of Tobit, as detailed

Apocryphal book bearing his name. The marginal notes will in turn afford some consolation to the friends of the bird; putting these aside, however, the inference is that the habits of the ancient bird which dwelt in the walls of Nineveh, in the reign of Sarchedonus, were very similar to his modern Anglo-American cousins, who litter up the stoops of brown-stone fronts in the modern city on Manhattan Island

WINGATE VS. LAIDLEY.-When late last fall Laidley's "Rifle Firing" was sent out among riflemen the close similarity of the work to the small compilation of Gen. Wingate on the same subject led many who were familiar with rifle literature to cast it aside as of no value, since it contributed so little that was not already known. It was evident that Col. Laidley had only a closet or theoretical knowledge of rifle practice, and that his work at best was only an attempt to provide a book for the army by an army officer in preference to one prepared by an outsider and a member of the National Guard. But while it was almost a certainty that the work was not to create more than a transient riffle in rifle circles, Gen. Wingate did not allow the bald and barefaced infraction of his copyright to go unnoticed. As the case went almost at once into the courts, the FOREST AND STREAM has abstained from making any comments on the controversy, not even going to the extent of a notice of the Laidley book. Within the past few days the action in the United States Courts has reached a conclusion, in a complete victory for Gen. Wingate, by the issuance of a decree of perpetual injunction against Col. Laidley and his publishers, the full text of the decree to be found in our rifle columns. The matter has been watched with a sharp interest by army officers, since the curious spectacle was presented of an officer high in the service of the ordnance department, when ordered by his superior, the Chief of Ordnance of the Army, to prepare a book, filching entire sections with the poorest shadow of a change in phraseology, and when the work was approved by the Secretary of War, and sent far and wide to army posts and officers all over the country, to have it judicially determined by an action in equity that Col. Laidley had approthat which was not his own and palmed it off on his superior officers as an original work. He did not give the least credit to the sources of his information. nor did his superiors detect the character of the work which was presented for their approval. The whole matter is one which does little credit to the army side in the controversy. It is a fair, flat acknowledgment that the man thought most competent in the whole army of the United States to prepare a work on rifle practice was not so competent, but did not scruple to appropriate, to use no stronger term, what he could not himself prepare. West Point has never had a work on this important branch of military science; there are many works on gunnery, many on the force of explosives, and reports many and various on small arms and magazine rifles, but a work from which the soldier may learn how to use his infantry arms has not yet been in possession of the army of the United States. The National Guard secured such a work, made rapid progress in rifle firing, so much so as to completely defeat picked teams of regulars, and now, as a crowning mishap in the chapter of accidents which regular army rifle practice has thus far been, an official high in rank is convicted of an offense which gives point to Gen. Wingate's closing phrase in his review of the infringing work, that Col. Luidley had shown himself unworthy of consideration as an officer and a gentleman. The matter, however, should not be made a personal one. The blame must rest on the army as a whole. It has been sadly and lamentably deficient in this important branch, and its ignorance and helplessness is in nothing so conspicuous as in this latest decision.

Who was John A. Grindle?-Where did he live and what disgraceful thing did he do, that that most detestable fish-reptile, the "Grindle," "lawyer," "dog-fish" (Amia calva), was named after him? Had any one else asked that question we should have referred them to our frequent correspondent "Salmon Roe," of Jacksonport, Ark., who is well versed in the ichthyological lore of his section; but it happens that "Salmon Roe" is the very one who propounds the puzzle. We are probably safe in assuming that the question was sent to us, not because our friend really wished to know who John A. Grindle was, but rather an expression of intense disgust after a day of vexatious experience with the ugly and voracious fish in question. It is a summing up in one terse interrogatory of a whole page of anothema and expletives. But "Salmon Roe" errs in casting the odium of the Grindlefish back upon the memory of the man after whom it is named. It is surely an unsafe assumption to premise that because a specimen of natural history is an unpleasant thing to deal with, any ill repute should thereby be attached to its god-father. It is considered quite an honor than otherwise to have one's Latinized patronymic incorporated into the scientific nomenclature of what Oliver Goldsmith designates Animated Nature. We are acquainted with some men, whose craving after fame does not extend beyond securing for their names such a piscatorial immortality; nor, so far as we may judge, are in the ninth and tenth verses of the second chapter of the they at all fastidious about the game qualities or specific characteristics of the particular species which is to bear their memory into the bogs, swamps and ocean depths of posterity; finely flavored food fish or misshapen mon. strous man eater-it's all one and the same to them. Viewed from the esthetic side of it, however, it may be urged that the name which is linked to that of the food fish will be oftenest heard at the breakfast table of the pedant, while the name which is tucked on as one of the spines of the ugly denizen of the lakes and rivers will be sounded with the impatient exclamations of discusted anglers. The "Grindle" is a case in point a greedy, ill-mannered and savage fish, tenacious of life and comparatively as powerful with his tail as a Florida alligator, and not the thing to meet when one is fishing for other game. By the way, this peculiar fish would have made a fair showing in our "Fish Swallowing Fish" stories, for here is what Dr. D. C. Estes says about one of their peculiar habits :-

While the parent still remains with the young, if the family I owns suddenly alarmed, the capacious mouth of the old fish will open, and in rushes the entire host of little ones; the ugly maw is at once closed and off she rushes to a place of security, when again the little captives are set at liberty.

This is all we can tell our correspondent in reply to his query. If he is not satisfied with our answer, possibly some one else may bring to gaff a better reply to his inquiry; and if so we should be glad to publish the size and weight of the catch.

WANTED .- Daft's American Eleven is to play the Eleven of England, a three months' match-17th, 18th and 19th of May, for the benefit of the Cricketer's Fund Friendly Society. The match is under the auspices of the Mary lebone Club. Another charity which this much-looked up-to organization could at the same time bestow, would be a set of rules, framed in a manner that people in a strange land might dimly comprehend. Except the ac count of the adventures of Alice in Wonderland and the Hunting of the Shark, the equal of the Marylebone laws for descriptive clearness has never been published. We have enjoyed studying out the mysteries of "shorts" and "puts" and "calls;" the terms of the race track have had some charm, and "bluff," "straddle," "ante," "call" and "go-you-one-better" have possessed their in terest, but the length and infinite mystery of the present laws of cricket and their primitive nomenclature overcome one with dismay. Of course it is great fun to the initiated, but seriously it appears to us that if the laws were simplified it would help to make the game more popular in America,-"'Ows that?'

Norrs -The slaughter of buffalo goes on, and one wonders at the vast number of these animals there must have been and must be even yet to stand this wholesale de struction year after year. Outside of a regularly appointed abattoir and a winter deer-yard, there is nowhere in the world such systematic, business-like and relentless killing as on the buffalo plains. The Texas cow-boy, as pictured by our correspondent, is one of your ghouls who delights in bovine murder, and his craving for blood will never be quenched until his sport is spoiled by the extermination of his victims.

The Arion Ball to be held at Madison Square Garden this evening will be the most elaborate affair of the ball beason. Among those present will be Capt. Diebl, Capt. D. D. D. Yuengling, Capt. Geo. Acry, and a host of other gentlemen whose names are well known in New York rifle circles.

Wisconsin has fallen into line by the formation of a State Sportsmen's Association for the protection of fish, game and birds. To the Kinnickinnic Club, of Milwaukee, belongs the credit of the inception of this movement We welcome the new association to the ranks of the workers for game protection, and with all the more pleasure because the members of the body are men who mean business. All success to them. Wisconsin is a grand State for game and fish; to properly protect the present supply and to insure against diminution will demand systematic and untiring labor.

There has been an unusual crop of small boys in the police courts recently. Most of the little rascals were brought up on the charge of having run off from home or school with the avowed determination of fighting Indians or becoming pirates. There are many reasons why young folks become restless and dissatisfied at home and think that they can better their condition by starting out on the war path. One cause of the trouble is the vicious literature upon which their brains and souls are fed. It behaves every father and mother to see what kind of books and papers their boys are reading. There are so many good (not goody) books now that no lack of the proper mental food can be urged as an excuse for cramming young heads with pernicious nonsenses. It is a most excellent plan as well to make a child interested in some hobby, or special pursuit; something which is not exactly play. Let him keep an aquarium and study the liabits of the fishes in it; give him a quarry of rabbits; set him at breeding fattey pigeons or poultry; give him some hints in botany; when he is old enough fit him out

with rod and line, or with dog and gun; and when you have taught him to go out into the fields with his eyes open for the thousand and one wonders in his path, you need not fear that he will clope with the gun and start out after redskins. In short, you who love rod and gun and the fields and the landscape, see to it that your s are learning of this wisdom of the natural world; cultivate in them your own sportsman's tastes, and our word for it they will repay the teaching ten fold.

One of the New York daily papers makes a specialty of the accidents which happen to sportsmen. By industriously gathering reports of these casualties from Maine to Texas quite a grim record is collected; formidable enough, in fact, to point a very capacious moral. Yet it would not be difficult to show that, even during the most perilous period of one's early acquaintance with fire-arms the handling of guns is a safe employment. Mr. Charles Francis Adams asserts that the statistics of railroad casualties show that the safest place in the world is on a railroad express train at full speed; and reasoning in like manner from the percentage of the sportsmen who are injured among the total number of men who use fire-arms, we might conclude that the safest position in the world is at the rear of a loaded gun. The fallacy that leads to so much disaster is the evident conviction entertained by thoughtless gunners that the safest position for themselves or their friends is at the muzzle of a gun which is both loaded and cocked. Nothing but a casualty ever teaches these men their error, and when they learn the lesson it is usually too late to profit by it. Meanwhile let no one be daunted by these industrious newspaper collections of shot-gun casualties. Tens of thousands of guns are handled with impunity, and more men have been killed within the last twelve months by the imple ments of labor than by those of sport.

Commenting upon a recent French novel, the Boston Literary World observes that a " passionate love for natural scenery is manifesting itself more and more all through modern French literature," which perhaps means an advance of French literature in general, and a purification of the French novel in particular, which would certainly not be injured by a liberal supply of fresh air and natural scenery. We do not naturally turn to France for word landscape-painting.

From the swamps of the euphoniously named Cow Island, in Louisiana, comes the weird, strange story of a hen which has hatched out seventeen alligator eggs, and now perambulates about the premises with her interesting And Florida-emulous Florida, which is always one ahead-has her hen too. Three of her eggs were swallowed by a snake, which the irate hen pursued into the woods and slew. Several days afterward a farm hand discovered three young chicks picking their way out through the skin of their reptilian incubator.

GAME PROTECTION.

MICHIGAN SPORTSMEN'S ASSOCIATION.

T HE fifth annual session of the Michigan Sportsmen's Association convened at Bay City, Feb. 4th and 5th. The former meetings of the association have been characterized by earnest and practical discussions of live ques tions relating to game and fish and their protection, and the Association has earned for itself the name of being in reality what its name imports. The attitude of the morn bers and the spirit by which they are actuated were admirably expressed by Mr. W. C. Colburn, one of the delegates from Detroit, who said :--

We are neither more nor less than citizens of the State We are neither more nor less than citzens of the State, who in point of character and intelligence, I claim, will compare favorably with any other body of citizens who assemble together in convention in behalf of any object that affects the business, health and wealth of the whole State. I hold that the especial work of this association is in the direct line of sustaining and producing wealth for the State, as important, in its measure, as the cultiva-tion of the soil and the production of its grain or fruit food for the people. We go to the Legislature with no selfish ends to serve, but only in the interest of the pre-servation and perpetuation of all valuable food game, animals and fishes—a subject of far greater importance to the people, especially to the residents of the more recently settled portions of our State, than is generally appreciated. I think that the dignity of this body, and the importance of the work we have in hand, should be more plainly and emphatically asserted, and the resolu-tions under consideration, if adopted by this convention, will be a move in that direction."

The officers of the association for the past year were: for the State, as important, in its measure, as the

will be a move in that direction."
The officers of the association for the past year were: President, E. S. Holmes, Grand Rapids; Sceretary, H. B. Roney, East Saginaw; Treasurer, N. A. Osgood, Battle Creek; Director for four years, Cyrus W. Higby, Jackson; Director for three years, W. C. Colburn, Detroit; Director for two years, E. C. Nichols, Battle Creek; Director for one year, D. H. Fitzhugh, Jr., Bay

Sportsmen's Club, Grand Rapids: Harry Widdicomb J. C. Parker, W. C. Dennis, George A. Gould, E. H. Sportsmen's Club, Grand Rapids: Harry Widdicomb J. C. Parker, W. C. Dennis, George A. Gould, E. H. Barnard. Bay County Sportsmen's Association, Bay City: S. T. Holmes, D. H. Fitzhugh, Jr., S. A. McLean, S. Van Dusen, John Wilkins. Lake St. Clair Fishing and Shooting Club, Detroit: W. C. Colburn, L. W. Tinker, John F. McMillan, Point Moullie Shooting Club: B. H. Rupert, Charles G. Jewett, R. H. Rumsey, E. G. Angel, Edwin Wilcox. Messrs, N. A. Osgood and E. C. Nichols were received as delegates from the Battle Creek Sportsmen's Club.

In his opening speech to the Convention, President

were received as delegates from the men's Club.

In his opening speech to the Convention, President Holmes suggested that the most effective way to secure proper gane legislation would be to secure the services of some ardent and judicious game protectionist to go to Lansing with well prepared bills, and stay there, working the this interest till final action on the same. This is a

proper game legislation would be to secure the services of some ardent and judicious game protectionist to go to Lansing with well prepared bills, and stay there, working in this interest till final action on the same. This is a course which has been adopted to carry out the ends of other interests, nor is there any reason why it should not prove equally effective in this branch of legislation.

One feature of the society's work has been the presentation of voluntary essays by its members and others, and the report of committees appointed to prepare papers on assigned topics. There were a number of these essays read at the last meeting which merit attention, both from the matter contained in them and also because they give evidence of increasing interest in the ethics of sportsmanship and the science of natural history. Mr. Gillman, who read a paper on sporting dogs, prefaced his thoroughly sound remarks by paying a high tribute to both the practical breeder and breaker, and their necessary qualities, not only as thinking men but as experimentalists. He most opportunely referred to the great revolutionary stride which has faken place during the last six years, showing that the starting point was in the initial bench show first held in Michigan, which has led to-day to the firm foot-hold of wonderfully improved stock throughout the length and breadth of the land. In touching upon the expediency of field trials, he strikes the key note in these ringing words: "An animal may be well-bred, and good looking and symmetrical enough to win at a bench show, but if it does not possess, in addition to blood and beauty, first-class field qualities it is not worth breeding to." For the best season to run the trials, he rightly advocated the early and usually favorable weather of November; and he also wisely advocates a central location for the holding of same. The expenses attending all field trial exhibitions Mr. Gillman considers to be the rightly advocated, as entral location for the holding of same. The expenses attendi extortionate bagg with a kindly ple The report of

The report of the committee on nomenclature was an exhaustive discussion of the subject, designed to secure the use of a correct and uniform system of names for our game. This paper will receive further and fuller notice

from us,

Mr. Frank N. Clark, of Northville, a member of the
U. S. Fish Commission, read a paper on the "Red-banded
Trout of California," urging its merits as a gane and food
fish, and recommending that it be transplanted to Michigam waters. This was followed by a full history of
"Michigan Fish Culture," prepared and read by Mr. J.
G. Portman, of the State Fish Commission; and a further
contribution to this branch of the Association's work was
an essay by Mr. Mather. an essay by Mr. Mather.

The committee on laws recommended that the provision

an essay by Mr. Mather.

The committee on lawsrecommended that the provision against exporting deer out of the State be made a separate bill, that the opposition thereto might not, as it had done before, defeat the measure which they deemed best for the protection of that animal. The bill recommended provides "that no person shall pursue, hunt or kill any wild elk, wild buck, doe or fawn, save only in the Upper Peninsula, from the first day of August to the 15th day of November, and in the Lower Peninsula from the 15th day of Spetember to the 15th day of November, inclusive, in each year, or kill at any time any deer when it is in its red coat, or any fawn when it is in its spoted coat, or have in his possession the skin of such deer or fawn in the skin of such deer or fawn shall be prima facte evidence of such of such deer or fawn shall be prima facte evidence of such mive in its possession to each of such deer or fawn in the red or spotted coat, and the having in possession the skin of such deer or fawn shall be printifect evidence of such illegal killing. No person shall at any time kill or capture any deer in the waters of any of the streams, ponds or lakes within the jurisdiction of this State." I further or lakes within the jurisdiction of this State." It further fixes the open season for wild turkeys from Oct. 1st to Jan. 1st; woodcock, Sept. 1st to Jan. 1st; pramic chicken or pinnated grouse, partridge, grouse of any species, wood duck, teal duck, mullard duck and gray duck, from Sept. 1st to Jan. 1st.

The election of olicers resulted as follows; President, Dr. E. S. Holmes; Secretary, H. B. Roney; Treasurer, N. A. Osgood; Director for four years, D. H. Fitzhugh, Jr. The Convention then adjourned, to meet at Lansing on the fourth Tuesday in January, 1881.

There were so many topics of interest deserving of fuller mention than we can here give them, that we shall recur to some of them next week.

ANOTHER STATE ASSOCIATION.—The Kinnickinnic Gun Club, of Milwaukee, Wis., now three years old, is an energetic and earnest body of men who are making their influence felt for the protection of game and the advancement of the interests of sportsmen. The third annual banquet of the club was held last week at the Newhall House, Milwaukee, on Tuesday evening, at which gathered a large number of local sportsmen and invited friends from all over the State. There were the usual festivities of such a happy occasion; for Wisconsin sportsmen always know how to enjoy themselves when gathered together; but the movement which deserves special mention was the organization of the Minnesota Sportsmen's Association for the Protection of Fish, Game and Birds. The laws and rules are much the same as the Michigan Association, with the following changes from the Michigan Association who shall be found guilty of any violation of the game laws of this State shall be expelled, NOTHER STATE ASSOCIATION.—The Kinnickinnic Gun

and any auxiliary club which fails to discipline any of its and any anximity clin which this to describe any to his members for such violation shall be dropped from the rolls of the association." The following are the officers elected:—President, Fred, Reitbrock, Milwaukee; Vice-Presidents, C. Simonds, Milwaukee; R. M. Boyd, Racine; G. A. Winchester, Whitewater; E. H. Strong, Baraboo; C. E. Norbeck, La Crosse; W. K. Delaney, Mayville; Chas. Felker, Oshkosh; Wm. Merrill, Prairie du Chien; M. T. Bailey, Madison; W. W. Corning, Portage; T. S. Powers, Tomah; J. G. Rowell, Beaver Dam; P. F. Tiel, Eau Claire; W. A. Van Brunt, Horicon; Sam, Fieffeld, Ashland; J. C. Neville, Green Bay; F. A. Turner, Stoughton; L. M. Wyate, Fend du Lac; E. W. Jones, Waupin; John Laigh, Oconto: Peter Greeley, Muckwonago; M. J. Eagan, Franklin; H. A. Taylor, Hudson; Jacob Kolter, Wansan; Lou. Walker, Planifield; J. H. Boyle, Winnecome; F. W. Sackett, Berlin; Secretary, S. J. Williams; Treasurer, Stuart Murray; Committee on Legislation, James A. Mallory, D. W. Small and Geo, H. Markham.

The officers of the Kinnickinnic Gun Club are:—O. W. Robertson, President; Stewart Murray, Vice-President, Murray, President; Stewart Murray, Vice-President, members for such violation shall be dropped from the rolls of the association." The following are the officers elected:—President, Fred, Reitbrock, Milwaukee; Vice-

Robertson, President: Stewart Murray, Vice-President, and A. C. Jones, Secretary and Treasurer.

The Migratory Qual. In Georgia.—Thomasville, Ga., Feb. 12th.—In your last number is an account of a migratory quali caught on Mr. James Blackshear's place, near Thomasville. Some negroes working in a field saw the bird rise near them and pitch thirty or forty yards away in grass cover. Marking the spot they surrounded it and caught the bird, which was brought to Thomasville and kept in a cage for nearly a week. It was kept as a curiosity, no one having ever seen the like before in these parts. I begged its life, and asked to have it returned to the place of its capture and liberated. Unfortunately it refused food (rice), and died the day before it was to have been freed from captivity. I have not heard of any others in Thomas County this year; but in the whiter of 1878-79 a small beyy—four or five—were know to be on Mr. Blackshear's farm.

Game Bag and Gun.

GAME IN SEASON IN FEBRUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fo "Bay birds" generally, including various species of plover, sand piper, saipe, curlew, oyster-cutcher, surf birds, phalaropes, avo-cets, etc., coming under the group Limacola or Shore Birds.

GAME AND FISH DIRECTORY.

In sending reports for the Forest and Stream Directory to In sending reports for the Forest And Streets Director, Game and Fish Resorts, our correspondents are requested to get the following particulars, with such other information as the may deem of value: State, Town, County; means of access; Ho and other accommodations; Game and its Season; Fish and its Sea oats, Guides, etc.; Name of person to address.

THE STATE CONVENTION .- The Convention of the New York State Association for the Protection of Fish and Game, which is to be held at Seneca Falls next spring, promises to be the largest gathering of sportsmen ever yet brought together in this State. Mr. Horace Silsby, the President of the Association, has been for several days in this city, securing prizes, and his efforts have met with most gratifying success. A large number of handsome and valuable prizes have already been secured, and the list promises to be more complete and generous than ever before. The following committees have been appointed by the Seneca Gun Club :-

On Birds-J. F. Lawrence, E. V. Burton, William Par rish, J. G. Stacey, Wm. V. Van Rennsselaer.

On Prizes-C. H. Williams, Francis Bacon, E. W. Bull, John Cuddeback, Levi Van Buskirk,

On Grounds-M. Hoag, Sol. Carman, H. R. Selleck, E. H. Adair, J. A. Niver.

On Printing—Henry Stowell, E. A. Rumsey, E. C. Os borne, J. D. Pollard, J. N. Hammond.

On Finance-W. P. Elwell, R. C. Wayne, J. T. Miller, Jr., A. R. Palmer, G. M. Guion.

On Fly Casting—J. B. Murray, C. H. Tuttle, J. H. Par sons, C. H. Westcott, Henry Fox. On Rooms-J. H. Gordon, J. G. Minges, H. Stowell,

Millard Frantz, E. Rosencrans.

On Pistol Shooting-Sam. Jacoby, F. Nearpass, E. Hill H. J. Purdy, M. Burroughs.

Shooting-J. B. Tubbs. H. R. Selleck, J. On Rifle Crocker, John Nearpass, Geo. Esterly,

On Reception-Gen. G. M. Guion, Gen. J. B. Murray J. D. Pollard, A. L. Childs, W. R. Kennard, Henry Marshall, A. Cook, E. W. Bull. A. H. Conastock, H. Burt R. Merritt, John Van Buskirk, John McIntosh, Francis Bacon, E. Lester, A. Hollenbeck, L. Goodman, D. Marsh, F. Maier, F. Brady, George Hayt, Wm. Van Rennsselaer, N. Duntz

PRACTICAL METROD OF PREVENTING RUST,-Rust is one of the banes of the sportsman's life if the owner of a gun happens to live in a moist, camp region. A Bennington (Vt.) correspondent, R. M. L., sends us the following method of preventing guns from rusting while in disuse :-

Allow me to recommend to your readers a very simple, yet absolutely certain, method of preventing rust in the bores of Anes and fowling-pieces. By this means I kept my guns in perfect order for six years in the destructive climate of India, where the dampness and sea air during the monsoons are foes alike to the sportunan and his

The method is as follows: Have made a cleaning rod The method is as follows: Have made a cleaning red nearly filling the bore of the gun. Then take a strip of cotton cloth (canton flannel is best) from an inch wide up to three inches, according to the size of the bore, and six inches longer than the barrel of the gun. Saturate it with any good oil or vaseline, double about two inches of the end over the end of the cleaning rod, and press into the bore. The remainder of the cloth will, with a little assistance, fold itself lengthwise around the cleaning rod as it is introduced thus filling up the vascus tance en assistance, rold itself lengthwise around the cleaning rod as it is introduced, thus filling up the vacant space entirely. You will see that by this means the air is completely excluded, and even the small quantity originally in the barrel is driven out. Where air cannot go moisture cannot, and the gun may remain untouched for months, or even be immersed in water, without injury to months, or even be immersed in water, without injury to the bore. Gen. Wingste recommends pouring melted tallow into the gun, filling the bore. You will see that the method I use is much preferable, as the gun can be examined at any time, or prepared for service in a few seconds, by simply withdrawing the rod. R. M. L. Bennington, Vt., Feb. 11th, 1880.

SAGACIOUS QUAIL AND IDIOTIC EMUS .-- A correspondent of the Sacramento Bee claims that the California quail understand fully the import of the legend, "No shooting allowed," and he says that the man would be hooted who should express incredulity on this point. He adds :-

snouid express increduitly on this point. He adds:—
I wasso fortunate the other day as to secure the privilege to shoot in a field well guarded on all sides with the
usual inscription. I found quail only near the warning,
but there in great quantities. I will suggest that all those
gentlemen who contemplate a quail-shooting excursion
shortly to provide themselves with a goodly quantity of
signs marked, "No shooting allowed," and place them,
without regard to order, in different places on the proposed ground.

A different bird altogether is the great, stupid emu of Australia, to capture which the hunters employ devices very similar to the artifices of antelope hunters on our Western plains. A writer in the last number of the London Field gives this amusing description of emu hunt-

They may also be easily shot by adopting the follow They may also be easily shot by adopting the following means: The emu seems possessed of an insatiable curiosity, and if it sees an unusual-looking object on the downs, it is not satisfied until it has fully investigated that object, no matter how difficult the circumstances under which it has to conduct its researches. The plan adopted when emus are wanted is, on seeing a mob of them feeding in the open, to ride within a quarter of a willout them, dismount have no your horse. them feeding in the open, to the within a quarter of a mile of them, dismount, hang up your lorse, walk a few yards away from him, and throw yourself flat on the ground, taking care that you are in full view of the birds. The more you then roll about, kick up your heels, shout, whistle and perform all manner of antics, the sooner will the birds come round you to see what new sooner will the birds come round you to see what new denizen of the downs has made its appearance. At first they will stand and stare with astonishment, but they they will stand and stare with astonismient, but that soon begin to approach nearer and nearer, till at last they are within arm's length. You may then, if so disposed pot the whole lot, as the report of the gun or rille merely causes the survivors to "jump round," to quickly return again to continue their examination of the unknown obagain to continue their examination of the unknown object. The emu forms a very primitive nest by merdy scratching together a little grass into a small heap, on which she lays seven to nine dark green eggs, weighing on an average about two pounds each. The eggs roasted are extremely good eating, and the man who can polish off more than one at a sitting is blessed with a tall appearance.

SPORTSMEN'S ROUTES IN MONTANA.-The following memoranda from our correspondent at Fort Custer, Montana Territory, are of practical value. We published a short time ago from the same writer a short account of the excellent trout streams of that country :-

short time ago from the same writer a short account of the excellent trout streams of that country:

As I have received letters of inquiry in regard to routes to this country, I thought by giving you the information it would be more generally received by those who contemplate a trip to our country. Parties who wish to come in winter should take the Union Paetile Railroad to Rock Creek, where Colonel Pattuck's stage line connects. From there to Custor is something near 400 miles, which is made in sixty-five hours when roads are good. In boating season Captain Grant Marsh runs from Bismark, landing passengers and freight at Fort Custer landing, and those conning by way of river will be well accommodated and cannot belp enjoying the trip, as the captain is a perfect gentleman, and has made the fastest time ever made on the Yellowstone. Those wishing pack and riding animals can always buy such animals, as there is a surplus in this country. There is also a stage line running from Bismark to Miles City, at the mouth of Tongue River and on up the Yellowstone to the mouth of Big Horn. From there to Custer I do not know their schedule time. These different routes are well stocked with game and fish, but closer to the mountains is better for trout. Clark's Fork of the Yellowstone is slive with these speckled beauties, but not so large as I have heard of being caught. The largest trout I ever caught was in Stinking Water, which was eighteen inches long. They are not as sweet as the mountain trout, nor have they as fine a flavor.

GRAY HARES.—Miss Leslie in her famous cook-book heads the receipt for roast hares with the instruction to "first catch the hares." Now, if there is one person above another, of whom we have had a practical illustration, "first catch the hards." Now, it there is one pleasantone, another, of whom we have had a principal illustration, who is able to do this, it is Mr. F. C. Backus, of Pritisfield, Mass. He is not only an expert in the way of Knocking them over, but has been kind enough to submit several fine samples for our discussion.

Inne samples for our discussion.

DORCHESTER SPORTSMEN'S CLUB.—A club with the above name has been formed at Dorchester, Mass. The officers are: President, O.J. Henry Smith; Vice-President, D. F. Eddy; Secretary and Treasurer, George E. King. The club is composed of influential gentlemen, and promises to be a strong addition to the sportsmen's organizations about the Hub.

CONNECTICUT TRAPPING .- Rev. Ebenezer Gifford, of

Wallingford, Conn., did not waste time last year in fruit-lessly bemoaning his meager salary, but killed 48 musk-rats and 12 skunks, selling their pelts.

SNIPE OUT OF SEASON,—Allica, N. Y., Feb. 7th—I shot a snipe on the 6th of February, and it is being set up by J. O. Ogden, a taxidermist of this place.
FRANCIS M. WILSON.

J. O. Ogden, a taxuermuse of the Francis M. Wilson.

CAZENOVIA GUN CLUB.—Cuzenovia, N. V., Feb. 12th.—

The members of the Cazenovia Gun Club had a pleasant entertainment a few months ago. The Sceretary, Henry J. Mather, had a deer sent him from Michigan and invited the sportsmen to dine with him at 6 P. M.; need hardly say that all were punctual, and a right jovial time we had of it. Some one remarked that they were sorry that there were not two deer sent; another that it would be too dear for our Secretary. All united in saying that they hoped if any of the other members of the sorry that there were not two deer sent; another that it would be too dear for our Secretary. All united in saying that they hoped if any of the other members of the club had friends West that they would send on plenty of deer, and that the member would follow the example of our worthy Secretary. Criticaden having now the club medal, presented the club with another to be shot Forther productions of the club with another to be shot Forther productions. for the coming season. HAMMERLESS.

VIRGINIA—Upper Paxton, Feb. 12th.—The gunners last fall did not bag near all the quail and rabbits in this township, and there is a fair sprinkling of that description of game still around.

townsmp, the mere with a found.

NORTH CAROLINA.—Monroe, Feb. 11th.—Game is scarce in this section. The quail have never recovered from the freeze out they had here three years ago. An attempt to have a game law in this county has resulted in the posting of nearly all the land, and the farmers say they won't raise birds in the summer for men to kill for amusement in winter, and it is difficult to get ground to shoot over. SNIPE.

TENNESSEE—Savannah, Feb. 7th.—This week the long-expected polar wave came to our relief. bringing the ducks with it. They were very wild, and no large bags have been made. The greatest number killed in one day have been made. The greatest number killed in one day to any one gun was eighteen. I was unfortunate in having a bright, mild day, with little wind, for ny excursion, and bagged only eleven. Nearly all the ducks are mallards, with a sprinkling of teal and an occasional woodduck. No sprigtails yet.

Ото-Wapakoneta, Feb. 10th,-A large flock of geese Office—Wapaconeta, Feb. 10th.—A large flock of geese passed over this place to-day on their way to the big reservoir (17,000 acres) ten miles from this place, in this county. The water is open in places, and both ducks and geese have been here all winter. The shell drake has been most abundant. We look for fine sport in a few weeks, as the reservoir is bank full, and the old timbers and will-

as the reservoir and feeding places.

Iowa-Dubuque, Feb. 7th.—A new shooting club has been formed here which is named the "Julien Gun Club." We have twenty members, and the officers are as follows: C. H. Gregoire, President; F. A. Miller, Vice-President; William Y. Bissell, Secretary; J. C.

Gregoire, Treasurer.

A NOTE FROM ABROAD,—Dresden, Jan. 21st.—Editor Forest and Stream.—Our shooting scason is over, and was very poor. Last season we killed on ten thousand acres near the city of Dresden, 683 hares and 757 partridges; this year 287 hares and 425 partridges. A great deal of game was killed this spring by heavy frost.

H. STRUVE.

THE SOUTH-SIDE CLUB.—The annual meeting of the South-Side Sportsmen's Club, of Long Island, took place Monday night at the Hotel Brunswick: there was a large attendance of the members. The proport of the Treasurer Monday night at the Hotel Brunswick: there was a large attendance of the members. The report of the Treasurer showed that the club was financially flourishing, and that the membership, which is limited to one hundred, is full. The names of several candidates were necessarily laid over. The club passed a series of memorial resolutions relating to the death of its late President, Recorder Hackett, in offering which Mr. John E. Develin recalled the long career of Mr. Hackett as President of the club:—

"In his youth Recorder Hackett manifested an hereditary devotion to the sports of the field and water. Later in life his extraordinary nerve, quick eye and rapidly of action placed him in the foremost ranks as an expert sportsman, so that the fame of his marvelous skill with pistol and gun preceded him wheresoever he went, and

pistol and gun preceded him wheresoever he went, and became known and excited admiration, if not ency, even in the first of the Pacific cities. Nor was he a mere blind devotee of the gentle art. He was pervaded with a deep love of nature. The forests and streams, the hills valleys and fields which he traversed in pursuit of his favorite anusement ministered to this sentiment. Under their influences his manner and spirits, somewhat somber at times, would become joyous, and his quaint remarks or odd specches would quicken and delight the brightest of his companions and enliven and amuse the dullest of his attendants. His manly form, his ready humor, his fund of ancedote and story, his inimitable powers of narmation, his love of harmony, and his genial spirits drew around and endeared him to his many friends throughout the whole country." ustol and gun preceded him wheresoever he went, and

around and endeared him to his many friends throughout the whole country."

An election of officers for the ensuing year resulted in the unanimous choice of John Benkard as President; Charles Banks, Vice-Fresident; Whikau M. Fleiss, Treasurer; John E. Develin, Counsel, and George W. Hall and Roland Redmond, Executive Committee.

The keeper of the club-grounds at Islip reported that the prospect for brout-fishing for the approaching season was excellent, and that it would probably be the best fishing since the organization of the club in 1806. Since then the best of the choice of the

is much capital shooting afforded.

SOMETHING ABOUT SHOT AND PATTERNS.—Philadelphia, Feb. 14th.—Editor Forest and Stream:—When I desire to test the shooting qualities of a gun I invariably use Sparks' chilled shot, which I have never known to vary.

About a year ago I wrote an article describing the manufacture of shot at Sparks' shot tower, which was printed in your journal, a short extract from which may not be out of place here. It is as follows:—

"The melted metal is poured into pans with bottoms of Russia sheet iron, perforated so small that for the No. 12 size the holes would scarcely admit the point of a pin.

forms in globules on the under side, and drops a sheer

forms in globules on the under side, and drops a sheer fall of seventy-five feet into a well containing from six to eight feet of water. The smaller sizes (say from No. 5 to No. 12) are cast in pane perforated with bloke several sizes smaller than the shot, so as to allow the pellets to enlarge after they ooze through the perforations, while the larger sizes are run through pans with holes larger than the shot, as the metal contracts in cooling. Great care is necessary in mixing the metal, as if not of the proper quality it would run through the holes, drop in strings, and no shot could be produced.

"The shot is then taken out of the water (several sizes being in the mass), placed in drying pans heated by steam, and carried up a short distance, from which it is allowed to run through an inclined trough into a receiver, which process dries it; from the receiver it passes into a runbler, which cleans it, thenco through a screen on to class tables. These glass tables are five in number: the first one is slightly inclined, so that the shot can roll over it on to the second, which is less inclined, the inclination of the tables diminishing until the last one, which is perfectly level, is reached. There is a space of about two inches between each table, and a fall of about two and a half inches from one table to the other. The shot that are perfectly round roll over the first table, a distance of three feet, and skipping the gap fall upon the next table, and as continue until they reach the last one, from which they roll into another receiver. All the flat or imperfect shot fall between the tables, and as collected together for re-melting. From this last receiver the shot pass by means of pipes into brase cylinders, which are perforated with holes the exact standard sizes. There are a number of these cylinders, from No. 12 to No. 1, and for the larger shot, B, BB, BBB, T, TT and F. These cylinders are turned slowly by steam power, and work with the precision of clock-work. The No. 13 size fall through the holes of t

to become mixed."

If your correspondents will use Sparks' shot in their experiments they will find that when they measure out an ounce of shot they will have the exact number of pellets set forth in the circular, and no mixture of sizes. An ounce of chilled shot, Sparks' No. 8, contains 432 pellets of soft shot there are 426 pellets in an ounce. C, C,

ANTI-RECOIL PADS.—No. 948 Broadway, N. Y., Feb. 19th.—Editor Forest and Stream:—I notice in yesterday's issue of your paper a letter from a gentleman from London, who writes that "anti-recoil pads" are not known in this country, to which I would beg leave to reply that I have been selling recoil pads for several years, and had Mr. Silver's pad (the one alluded to in the Verse) illustrated in mr. excludence of 1876. Apprison reprise and had Mr. Silver's pad (the one alluded to in the letter) illustrated in my catalogue of 1876. American sportsmen to whom I have shown the pad do not like it for the reason that it is necessary to cut off about an inch from the stock of the gun and adjust same permanently, making not afine finish to a gun, which you can see by the sample I send, which is supposed to be finished for adjusting to gun. The "red rubber recoil pad" is far superior to the Silver pad, as it can be applied and taken off in a moment, so as to be used for heavy charges only. It is not necessary to go to any expense in altering the stock of gun, which spoils the looks and symmetry of the whole gun. The rubber in the "red rubber recoil pad" is much softer than in the Silver pad, and therefore better adapted to take off the recoil pad in the pad of the pad of the recoil pad in the pad of the pad of the recoil pad in the pad of the

We have already noticed the recoil pad in our columns and have mentioned its advantages. The contrivance accomplishes its purposes admirably. For kicking guns -and some guns will kick despite the most careful load ing-we recommend Mr. Ritzmann's pad.

BUCKSHOT IN CHOKE-BORES.

Jong Prairie, Minn., Jan. 22d.—My brother and I both own Parker guis, 10 bore, 10 lbs., fine Damascus barrels, choked so as to give a target of 212 No. 8 shot in a 24 inch circle at 45 yards, at the shop. We have experimented a good deal of late in shooting buckshot. We have not tested thoroughly any new methods, but loaded our shells the same as with fine shot, using care not to shoot any size that would wedge in the choke. We commenced with 000, and kept using larger sizes as they would clamber in our guis, until we got to No. 4, of which size our guis chambered there very loosely in the choke, using nine for a charge. The distance in all our trials was 60 yards, and in all cases we used 5 drs. powder and two pink edge wads in the powder. The target used choke, using nine for a charge. The distance in all our trials was 80 yards, and in all cases we used 5 drs, powder and two pink edge wads in the powder. The target used was a 24 inch circle, and of 27 000, constituting a load, we could put in 12 to 16 of these shot, but of the sized shot between this and No. 4 we could get in but few, the guns throwing them wild. Loading several shells carefully with the No. 4, we tried them, and in several cases put 7 out of the 9 in the circle, 4 in the centre of the circle and the others evenly around, one of the nine being generally thrown pretty wild. In all our trials at 60 yards we never failed to get in less than 5, and they were all driven with such force as to pass through a 2½ inch plank. On one occasion my brother went back to 100 yards and tried a shot and got 7 in the circle, which I believe cannot be beaten by any gun in the States. On one occasion recently I put 212 No. A shot in a 15 inch circle at 50 yards with a load of 4 drs. of powder and \$ of an ounce of shot, or almost the entire charge. For my part I prefer 10 lbs. for a No. 10, and 9 lbs. for a No. 12, and not an ounce lighter, as the game here is mostly duck and requires heavy charges, which with a lighter gun will bruise the shoulder severely. I would add another half pound to my 10-pounder if I could, and believe I could shoot better. Men differ in this matter the same as in any other, but I do not believe any one can use 5 drs. of Hazard in a 10 bore of less than 0 lbs. weight all day without being much more knocked up than if he had handled the extra pound; nor do I believe he could do as good execution. I am speaking of field hunting, where it requires 5 drs. of powder to fetch the game.

I am speaking of neut number where it requires a crs. of powder for fetch the game.

The Forest and Stream is a very welcome visitor, and I have gained nucle knowledge from its pages. It is so comprehensive. There is no game here now, and it makes one feel envious to read accounts of the exploits of

brother sportsmen in more favored climes. But Spring will soon come, when I can again feel the gentle thump of my gun atmy shoulder, and see through the curling smoke the tumbling mallards. It is a good place for sportsmen to come for deer-hunting, but it is twenty miles off the railroad. Game is plenty within easy reach of our hotels, 75 or 100 deer being killed this fall, within four or five miles of town.

Oconto, Wis., Icb., 1880.—I will repeat the latest device, as it is really a useful discovery: Split one side of paper shell (as suggested in Dec. 4th number) so that when pressed together it easily slips into the muzzle. Now for 10 gauge gun place paper shell on table, close it, and put in 13 buckshot as follows: Take largest buckshot of which it will easily chamber three, and over each and put in 12 buckshot as follows: Take largest buckshot of which it will easily chumber three, and over each layer but the last 3 buckshot cut off the paper shell and you have the desired length to cut your paper shells or concentrators. You have only to slip these into the brass shell on the powder wad, put in your layers of buckshot and their pasteboard wads, cut to fit the paper shell when closed, and put a pink edge wad on the last layer of buckshot, which should come just to the top of the concentrator. Load for 10 lb. gun as follows for brass shell: 4 ozs. powder, 1 No. 8 pink edge wad, buckshot in concentrator as directed, and then 1 No. 8 pink edge wad on buckshot, not pressed down too tightly. If you have and paper shell that just slips into the muzzle you have only to slit it; if it is one of your No. 10 paper shells you must cut a piece out to make it small enough to slip into muzzle. You must in every case split the shell, for two reasons; first, so as to be sure it will not stick at the muzzle; second, so that it will open out to fill the brass shell, when inserted in it. Your layers of buckshot, of course, will lay loosely in the brass shell, but, the thin paper wad keeps them in place. I may be wrong, but my theory is that when this load reaches the choke the paper shell is closed firmly around the buckshot and it passes out as true as if in a cylinder bore. The largest buckshot, side ded and the spot. I have frequently tried "R. I s" method, stated in Forest AND STREAM largest buckshot is the best, as they are more apt to bleed adeer if he is not killed dead on the spot. I have frequently tried "R. J.'s" method, stated in Forest AND STREAM of Jan. 15th, but while it is a decided improvement on the ordinary way, I considered this mode so much better I did not suggest his. In deer shooting the great desideratum is to have the gun shoot the largest buckshot closely. You can pepper a big buck full of No. 8 buckshot and yet not stop him. This method is useless for fine shot, as the paper shell only blows out a few feet beyond the nuzzle, and Eley's concentrators, I suppose, are good enough for fine shot.

SHOOTING MATCHES.

Scores.—Secretaries of clubs are invited to send in scores of mutches. Such reports should reach us as early as possible after the date of the meeting.

THE SPORTSMEN OF WORCESTER. - Worcester, Mass., Feb. 10th. The close season for game being upon us, sportsmen in this vicin-The close season for game nemy upon us, sportsmen in this vicinity are devoting considerable attention to the modern substitute for the more enjoyable and exhibitanting sport of the field-glass-ball shooting. At the present time there are two well-equipped shooting clubs (not rivals) in this city, each having a good membership, grounds and houses; while there is probably no city of its size in the country whose sportsmen can justly claim as many

its size in the country whose sportsmen can justly claim as many fine guns as are owned and used in Worcester and its environs. During the last few months Mr. Wm. R. Schaefer, of Boston, who enjoys an caviable reputation for bonest dealing, and whose ability to successfully bore guns for hard and close shooting is not excelled if equaled in this country, has placed quite a large number of new guns of fine quality of the Schaefer and Daly manufacture, principally the latter, in the hands of Worcester shooters, with which creditable scores are being made. With one of the Daly guns a prize (an elegant powder horn with solid sliver mountings), donated by Mr. J. R. Shepard, of this city, was won on the grounds of the Sportsmen's Club Jan. 28th. by Mr. J. Gilman, from fourteen contestants, who broke

30th, by Mr. M. D. Gilman, from fourteen contestants, who broke 39th, by Mr. M. D. culman, trous Indirects contestants, who of occurrences on the five the contestant of twenty balls at eightheen yards rise. The balls were thrown from a Card rolary trap as improved by Mr. C. B. Holden, which improvements render the trap much more efficient and durable, and which throw the balls so swiftly that they land Ofty yards or more from the trap.

the same group is and from the same trap a fifty-ball match

On the same grounds and from the same trap a fifty-ball match was shot Feb. 6th between Messrs. L. R. Hudson and W. S. Perry, which has furnished opportunity for considerable good-natured challing among their respective friends.

Mr. Hudson used a 10-gauge Scott and Mr. Perry a 23-gauge Parker, the former winning the match by the creditable score of 8t, the latter scoring 43. One of the local papers alludes to the eyent as follows:—

event as follows:—
An interesting glass-ball match of fifty balls on a side came off on the W. S. C. grounds yesterday—Youth vs. Age. Age scored 48 balls; Youth 43 balls. Inference; "Wisdom's ways are ways belonger when "

pleasantness." Ve may here state that Mr. Hudson would prove a very hot We may here state that Mr. Hudson would prove a very hot rival forany man of his years (nearly seventy) in the country, and a match between men of thatage would be of special interest and a decided novelty. Are there not among the many readers of the FOREST AND STREAM those of three score and ten who would like to distinguish thomselves by making such amatch? Sportsmen here regard the conditions of the challenge recently issued through the press by the Haymond Club as a substantial

bandiean in favor of the challenging club.

RHOLE ISLAND.—A bill to prohibit pigeon shooting from traps 1 Rhode Island passed the House of Representatives of that tate last Thursday, and our correspondent surmised that it would pass the Senate.

RIVERSIDE CLUB.—PÜLİŞBEİ, Mass., Fch. 13th.—At the annual meeting of the Hiverside Kille and Gun Club, heid at the Burbank House Thursday evening, the following officers were elected for the ensuing year:—W. A. Wentworth, President; R. Burbank and Henry L. Pierson, Vice-Presidents; C. A. Savoni, Secretary: and Henry L. Fusey, Treasurer; W. W. Tray and O. V. Preston, Officers of the Field; J. H. (Wood, Captain; W. G. Backus, Jr., W. L. White and Dwight M. Couch, Executive Committee.

New Haven, Feb., 14th.—The New Haven Gun Club is in a very

yous and flourishing condition, since its newly organiza prosperous and flourishing condition, since its newly organiza-tion and By-Laws, etc. I. now consists of nearly fifty members including the best wing, duck and glass-hall shots in the city-with several first-class rille-shots, and the winer of the schujer-Hartler, and Graham Badges of 1878 offered for rapidity and cecu; rate shooting. Never was there such a fine collection of new and costly guns at any clubshoot, as there was at the last medal shoot-

Had it been concrally known that the shoot was to come off on Had it been generally known that the shoot was to come on our that day, these would have been a much larger number entered for the Radge. Mr. Beers has won the Badge twice this year. He stands the best show for the Champion Gold Badge for 1884, valued at \$50. The score for the last Badge Shoot is as follows: Beers, 23; Moore, 17; Follows; Beers, 23; Moore, 17; Follows; Beers, 23; Moore, 17; Follows; Beers, 24; Moore, 17; Follows; Beers, 25; Moore, 25; Moore, cers, 23; Moore, 17; Folsom, 18; Hanson, withdrew—taken sie ette, 17; Howard, 19; Jorcy, withdrew—broken gun; Bunse f; Langdon, 17; and Mervin, 16. SHREWSBURY.

The Rifle.

AMERICAN RIFLES WANTED IN INDIA.—Editor Forest and stream:—Sir, I have lately seen the catalogues of three or four of the leading rifle makers in the State, and am much surprised at the the cheapness of the weapons therein described, which is I believe due to the fact that machinery is so largely if not exclusively employed in their manufacture, and I am sure if they were advertised and became well known, they would be much in demand by sportsmen in this country to whom it would be a boon if the Sharps, Ballard, Winchester and other companies had agencies at either Calcutta or Bombay.

There is one thing, however, in which American ritles, to Indian notions, compare rather unfavorably with English ones for sporting purposes, and that is in their weight, which is about 1½ pounds, on an average, heavier than that of English pieces of the same calibre; for instance, the weight of .40-calibre rifles is from 9 to 10 pounds or even more, and of .45, heavier still, while English , 40 rifles are made to weigh as low as 7½ pounds, even double-barrels, and .45, from 7½ to 9 pounds—a double, 50 express in my possession, 29½-inch barrels, weighing just 9 pounds, shoots 120-grains powder and 340-grains lead as pleasantly (even at a target) as a 12-bore shot gun with 3½ drachms and 1½ ounces.

The weight of a sporting rifle is of the greatest importance in most cases; of course the special heavy weapons used for certain kinds or one they reversible.

31 drachms and 14 ounces.

The weight of a sporting rifle is of the greatest importance in most cases; of course the special heavy weapons used for certain kinds of big game shooting are not as a rule carried by the shooter, so they are exceptions, but the weapon which should always be in one's hands, ready for any emergency, if much over 8 pounds in weight, is ant, especially in a climate like that of India, to be regarded as an incumbrance, and to be handed to the gun-bearer, a course which leads to much disappointment and loses one many chances, besides being dangerous. I believe that a 40-callive express, taking 70 to 90 grains powder, and weighing about 7 pounds, or if a more powerful weapon is thought necessary, a 45, taking say 120 grains, and weighing not over 8 pounds, would be the most handy and useful weapon to have in one's hands, and would not give much recoil with the light express bullet.

The ordinary 45 or .50 express bullet makes a most deadly explosive shell if the hollow is filled with a mix-

ture of chlorate of potash and sulphate of antimony in equal parts by weight; these should be ground fine separately and mixed dry on a plate of glass or china with a quill feather in very small quantities—the mouth of the bullet should be closed with a wax pellot. This mixture is rot at all sensitive, and the loaded bullets can be carried very safely in the cartridge—it is used for explosive spherical shells for smooth-bore guns as well as for rifles, with great success.

Bengal Sepox.

Poona, Dec. 20th, 1879.

RANGE AND GALLERY.

Massachusetts-Boston, Feb. 13th.-Mammoth Rifle Gallery. MASSACHUSETTS—Doston, Feb. 12th.—Mammoth Rifo Gallery.— The \$50 ritle match is progressing finely, and bids fair to excel the January match. Mr. N. Wilder, of the Glass Rifle Association, has made three clean scores of eight consecutive bull's-eyes each, or the highest possible score in the match, and now heads the list, closely followed by Mr. E. F. Richardson, of the same association, with two clean scores and a sphendid 30. This places him second, but as the incentive to make clean scores is twenty dellars in gold, no douth Mr. Richardson, before the month is finished, will try and outrank Mr. Wilder in this respect; but there Halshed, will try and outrank XI. Wilder in this respect, our torer are other greatlemen who have their eye on the extra prize, and no one is sure of it until the month is ended, or until the last shot is fired on Saturday night, the 28th. Last month Messrs. Richardson and Merrill were ite with three clean scores cach, or the highest possible, namely, 12). They met in the gallery last Wednesday evening to shoot off for the first and second prizes. Wednesday evening to shoot of it for the lirst and second prizes. The gallery was crowded with rillerinen and friends of the contestants, and some excellent shooting was shown. Mr. Richardson the statement of the best form. Mr. Mertill had been unwell for a week. They shot ten scores each, or a possible 400. Mr. Richardson made a plendid record of 307 (average, 379-10), which was remarkable shooting. For the first four scores they were tie, but from that time Mr. R. had the game all his own way. Mr. Merrill took his defeat kindly, and no doubt will try and the Mr. Richard son's score this month, whatever'tt may be, for a chance to try and win on the next shoot off. The following is the summary in the February match :-

| N. Wilder | 40 | 40 | 40 | 120 |
|---------------------|----|----|----|-----|
| E. F. Richardson | 39 | 40 | 40 | 119 |

Boston .- Mammoth Gallery .- The second week of the fifty-dol Boston.—Mammoth Gallery,—The second week of the fifty-dollar riflo match has shown some wonderful shooting. Mr. N. Wilder, of the Massachusetts Riflo Association, was successful in getting three scores of eight consecutive bull's-eyes, the highest possible score in the fifty-dollar match. He made two consecutive scores of eight bull's-eyes. Last month Mæssar likehardson and Merrill were tied with three clean scores each, or the highest possible score, namely, 120. They met in the gallery Wednesday evening, Feb. 11th, to shoot off. Mr. Richardson made a splendid record of 379 in possible 400, and won. The following is the standing of the several competitors to date in the February match; 150 feet; rounds, 8; possible, 40:—

Feb. 14th Mr. E. F. Manner ance, as the following record shows:

MASSACHUSETTS-Medford.-In October last the Medford Ama

MASSACHUSETTS—Madjord.—In October last the Medford Ama-teur Rille Association adopted a new method of dividing the short range target. It is the regular target of the N. R. A. in size, 4 ft. x 6 ft. divided as follows: Buil's-eye 8 inches di uneter; bull's-eye circle IT inches diameter; center 26 inches diameter; inner diameter; outer 4ft x 8 ft. Bull's-eye counts 6; bull's eye counts 6; bull's cycercle counts 5; center 4; inner 3; outer 2. It will be seen from the above that the only variation from the regular target is in dividing the center into two rings thus enabling a finer compari

THE FANCIEST OF PANCY SHOOTING.—Boston, Feb. 14th.—Editor Forest and Stream:—We notice an article in your last upon fancy shooting done by Dr. Knight of Kingston, Canada. It was very shooting done by Dr. Knight of Kingston, Canada. It was very fair for fancy shooting, but we have a man who tells a betty story. He used to knock ten cent pieces from between the teeth of a friend at 100 yards, and could shoot a whole line of pieces from the fluggers of his friends. The first was placed off twenty-five paces and held an old-style three-cent piece; the second two paces further, and held a ten-eent piece; the fourth, a quarter; the fifth, a half; the sixth, a silver dollar. The seventh was placed twenty-five paces from the last man and held a fin pail and caught the a piece. He never missed till one day the tim and contained all the pieces. He never missed till one day the tin pail contained all the pieces. The never insected in the day the cut pan comminged six index fingers instead of colors. Another gentleman shot off-hand at the head of a flour barrel one alle, and never missed, and was never so happy as when cutting the heads from which greese as they flew over. His rille was the "old pot" muzile-

geese as they flew over. His rifle was the "old pet" muzzle-loader, 23 to the pound.

We nil like fancy shooting and would be pleased to do the honors for the Doctor should he come this way. However, ke will find us but very plain shots. We never dared to shoot should a man put his head out of the pit 100 feet from the target. We do not like to risk mainting or killing a friend just for our sport. We know that a rifle bullet will just as quickly go through a friend's head as exhibit our skill. Therefore any friends of ours we try to keep out of the way, and satisfy ourselves by pounding away at an fron target. We hope before we put our friends up-walt is our intention to make use of them, a straight-lackex will away at an iron target. We hope before we put our friends and it is our intention to make use of them, a straight-jacket

CONNECTICUT-Collinsville, Feb. 11th .- Canton Rod a Riverside Range; practice meeting at 200 yards, off-hand; 3-lbs. pull, 10 shots:-

NEW YORK-Jamestown, Feb. 11th.-The regular monthly medal shooting of the Chaut. Sportsmen's Association took place this afternoon on the 200 yards range, but on account of the rough atternoon on the 200 yarus range, out of inevention or the roboting, weather there was a poor attendance and some poor shooting. The leading shots were (rounds, 10; possible, 50; H. V. Perry, 40; D. J. Langworthy, 38. We use the "Mongroff" target, a cross between the German Ring and the Creedmort, but there is a move made toward adopting one of the "theroughbred" targets.

There are a few breech-loading rifles here, but so far they fall to

come up to the point of securing the medal. Mr. Perry has now won the modal four times inside of a year with a muzzle-loading rifle of his own make. PINACENTER.

Time of also with make.

[Problym, Fisher's Gollery, Fish. 9th—The Ballard ritle match opened this evening; open to all comers using .23 caliber ritle; 16 shots at 300 yards target reduced; for a .22 Ballard ritle; 16 be won three times. T. P. White won it for the first time with 47 out of 50. On the evening of the 'rth J. W. Todd won the special match with 113 in possible 126 at ring target reduced.

NEW YOUR REFLE CLUB.—Feb. 11th.—At the regular shoot to-day the 'otal score for 10 men was 613, or 01 3-10 average per man F. J. Donaldson, our Captain, made 70 out of 75. Messrs. Daly and Howlet made 63 apiece, Mr. Daly's ranking first. To sustain in-terest the team is divided, and shoot side against side.

SCHUETZEN NOTES .- The first meeting of the Directors of the Schietzer Norts—And urst meeting of the Director's of the Schweizer Park at Union Hill, N. J., took place last week. The following officers were elected:—President, Colonel E. C. S. Lowis; First Vice-President, Fed. Harenburg; Second Vice-President, ex-Captain Aug. Ermisch; Treasurer, Hy. Offermann; Financial ex-Captain Aug. Ermisch; Treasurer, Hy. Offermann; Financial

Secretary, J. F. W. Mangels; Recording Secretary, A. Brieghet; Corresponding Secretary, F. C. Crevier.

Practice shooting will commence this month [as soon as the Capital and the two Schuetzen masters set up the programme for it. A fox hunt will take place on the 23d inst. at the Schuetzen

as follows:—Captain, Colonel J. J. Dichl; First Lieutenant, Adam Gelb; Second Lieutenant, Chs. Bruns; Orderly, Theo. Feldstein; Shooting Master, D. J. Stein; President, H. H. Hoenack; Recording Secretary, Conrad Gelb; Finacatel Secretary, Adam Gelb; Treasurer, D. Brubacher; Trustees, ex-Captain Val. Loewer, Fred. Handrich, Conrad Walcock. A committee consisting of Messrs. Colonel J. Stauf, Fred. Handrich and Theo. Feldstein was appointed to prepare for the next summer excursion. Washington and Richmond or Newport are in view. Major George Aery,

ton and Richmond or Newport are in view. Major George Aery, now Captain of the New York Schuctzen Corps, was again made honorary member of the Independents.

A grand fox hunt will take pince on the 23d inst. at Union Hill Schuctzen Park for the beneft of Wm. Kirbel, well known by almost all the German shooters of the United States. The foxes will be let loose on the above said day at 1 o'clock P.M.,

the hounds unchained a bull hour later.

The Holvetta Hille Club received lately a challenge from the Zettler's, but declined to accept it, as they are done with muzzle-loaders and only shoot with breech-loaders. The time shooting on practice days was reduced from five to three minutes.

on practice days was reduced from any to three minutes.

The New York Schucizen Corps held their annual meeting and election February 3d, at 18 Forsyth street. Major G. Aery presiding in the absence of Captain O. G. Yuengling, Jr. The following gentlemen were unanimously elected to form the Excentive Committee of the causing year, viz.—George Aery, Captain; B. H. Flenken, Recording Secretary; J. H. Meyer, Treature; H. Rottger, College and the Recording Secretary; J. H. Meyer, Treature; Financial Secretary; D. H. Lippold, Financial Secretary; Philips Rich and Deliburation of the Recording Matter The corps will have their annual calleo hop on the 10th of March at Beethovel Hall.

The Manhattan Rifle Club, George Aery, Captain, will celebrate The Manhattan Rille Club, George Aery, Captaln, will celebrate Washington's Birthay (the 231 inst,) with a prize shooting match, open to all comers, at Schuetzen Park, Union Hill, N. J.; distance 200 yards; any rifle allowed; two kinds of tarrets will be opened—ring and bull's-eye (pool) turget. On the ring target are 10 ptrzes, viz. 30 the first and \$1 the last; entrance fee, \$1; additional entrance, 50 cents, without limit. All money received on the bull's-eye atgrets, after deducting premiums and expenses, will be equally divided among the bull's-eyes shot; a premium of \$3 for the most, \$2 for the second most, and \$1 for the third most bull's-eyes shot will also be paid. Shooting will commence at 10 celebrate, a wand end at dark intermission from 12 to 123 00 cleaks. o'clock. A.a. and end at dark, intermission from 12 to 12.39 o'clock. Besides the above shooting the grand fox hunt also takes place, to commence at 10.39 o'clock.

The New York Schuetzen Corps held their annual meeting Feb.

The New York Conduction Colympia flow their annual adventage red. 21th at Germania Assembly Rooms, Capt. John F. Gerdes pre-siding. The following gentlement were clothed officers for the en-suing; year; John F. Gerdes, Captain; W. Schumacher, Recording Secretary; W. Brinckerman, Financial Secretury; H. W. Cordts, Treasurer; W. Watts, Custodian; A. Krouer, Gollector; F. manco-Committee, H. Bischof, W. Wattenoberger and — Silnacht; Shoot-ing Masters, J. W. Schnoider and — Ruub.

The Wingate-Laidley Contest.—In November last a suit in equity was commenced by Messrs, W. C. & T. P. Church, the pub-lishers of Wingate's "Manual of Rifle Practice," against W. R. Rishers of Wingards " Manual of Mille Fractices, figurias w al. Petton, the New York agent of Messes. Lippinout & Co., the pun-lishers of Laddley's "Ritle Firing," for having exposed for sale copies of the later work upon the ground that it infringed their copyright in Wingards's "Manual," Mr. Petton, upon being sued, andified both Messes. Lippinout and Colonel Indidgo of the action

another both Messes, Lippinosit and Colonier anticy of the declined at Co.
Upon his answer stating these facts, and that his violation of
the complainant's copyright was unconstitutional, the following
decree was entered by Judge Blatchford, of the United States
Circuit Court, on the 18th inst., perpetually enjoining the defendt from selling it:

The above-entitled action coming on to be heard upon the The above-entitled action coming on to be heard upon the plantiff's bill of complaint and upon the defendant's answer thereto admitting the violation of the plaintiff's copyright, on motion of George W. Wingate, of counsel for said complainants,

motion of George W. Wingate, of counsel for said complainants, it is ordered and decreed:

First. That the complainants are the owners of the copyright of the sevent editions of the "Nanual for Rille Practice, including Suggestions for Practice at Long Range, and for the Formation and Management of Ride Associations," by General George W. Wingate, General Inspector of Rille Practice of the State of New York, montroned in said bill of complaint, and that the same and each thereof has been duly copyrighted by them, and such copyrights are valid according to law.

Second, That the defendant has infringed upon said copyrights because for variety in the city of New York, without the com-

Second, that the defendant has infrinzed upon said copyrights by exposing for sale in the city of New York, without the complainant's consent, and knowing that the publishers thereof had not obtained their consent in writing or otherwise, ten copies of a book entitled "A Course of Instruction in Rifle Firing," by Col. T. T. S. Laidley, U. S. A., which book is largely composed of extracts copied from the several clittons of said Wingate's "Manual of Rifle Practice," described in said bill of complaint, and is a violating of the converging the proof covered by the case. and is a violation of the copyrights thereof owned by the com-

mmants.
Thirl. That the said defendant and his agents and associates. Third. That the sand defemant and the agents and associates, and each of them, be, and they are hereby, perpetually enjoined and restrained from printing, publishing or exposing for salo ay copy or copies of the said Laidley? "Rifle Exercises," or any other work embracing any portion of the several editions of said "Manual for Rifle Practice" described in the said bill of complaint, or of other thereof, and that a perpetual writ of injuncion be issued to that effect.

non be issued to make accept.

—E. M. Kiser, of Elic (ity, Chrion County, Pa., accepts the offer of Capt. A. H. Bogardus, as given on his programme, to shoot Eugene Bogardus, his son, a match 120 giass balls with a Winchester rifle, according to rules which govern the championship medal.

BOOKS RECEIVED.

THE SPORTSMAN'S YEAR BOOK. Cassell, Petter, Galpin & Co., London, Paris and New York.

This is the title of a new annual which will be welcomed by sportsman and journalist faille. The rapid extension of sports of all kinds has rendered a work of this nature an indispensable adjunct to all libraries. Though records of the best performances are published in journals of all sorts from time to time, they do not appear in a shape which renders ready reference a matter easily accomplished. Editors in particular, who are supposed to be walking encyclopedite of all and everything, will find the Sportsman's Annual" an excellent book for consultation, and when puzzled about the best time, the highest jump, the number and addresses of clubs, the rules and regulations of any department of sport, the pages of the Annual will give him rellet in settling vexed points and in deciding between his esteemed cor-Captain and the two Schuetzen masters set up the programme for it. A fox hint will take place on the 23d inst. at the Schuetzen Strating vexed points and it opening the bis esteemed correspondents, A and D, who are at loggerheads upon some question of the year's doings among the champions. The Annual Lifety general meeting at hendquarters, A. Golb's Walhalla, Major J, Diehl in the chair. Officers for the present year were elected in detail, but in some of its departments refers in a general way

to influences derived from this side of the Atlantic. With each boundaries are the state of the framework was been been as the book may be expected, and possibly American feats may find a place in its pages as well, so that international contrast can be made. In its yachting well, so that international contrast can be made. pages, the Annual does FOREST AND STREAM the honor of quoting pages, the Annual does rokest and stream the honor of quoting extensively from our columns, and, what is more, has the honosty to acknowledge the source of its information. Especially attrac-tive are the introductory articles with which each chapter is prefaced, giving an account of the origin of the various sports the earliest year of their development. From these we will take the earliest year of their dovelop mont. From these we will take the liberty of quoting as occasion presents itself. The book is very presentable, in point of type and paper, and is ably edited by Mr. J. Keith Ancus.

MATHEMATICAL TABLES. By Henry Law, C. E. Crosby, Lockycook & Co., London.

These tables compose a handy little volume of the well-known Weale's Series," and contain all the mathematical references required for the solution of trigonometrical, astronomical and nautical calculations. Those relating to the latter two subjects have been added to the book by J. W. Young, formerly of Belfast co been added to the book by J. I. Young, Johnson H. Bertas col-lege. The work is divided into two parts with a double object. The first to explain and illustrate the use and application of log-arithms for the practical calculator, or second part. This, how-over, has been kept entirely separate, so that it may be used over, has been kept entirely separate, so that it may be used by any one without even understanding the theory underlying the construction and derivation of the tables. Many skippers, finding themselves promoted to the cable without having enjoyed the advantages of good schooling and not having the time at once to study the reasons "why and wherefor," they are anxious chough to avail themselves of just such an arrangement, and the readvantage of the stable without his production. choign to await intenseries of places are an attanguezant active ready sale of the book is proof of its popularity among this class. As trigonometry and the use of logarithms are the stepping stones to navigation, the concise rules given will suffice to find a ship's position; the mariner in the meantime making as much of a study of the theory as he has a mind to, and omitting what may not be of use to him. The book also contains tables of pro-portion, interest, mensuration, mechanics, hydraulies, etc., to which the intelligent ship captain will often find occasion to refer-

Price in England, 80 cents.

—The Star Almanac for 1880, besides much of politics —The Star Almanac for 1896, desided interest or none at all, has in it a good line of sporting ovents and summaries, prepared by John II. Robbins, the sporting editor, which is a sufficient by John II. Robbins, the sporting editor, which is a sufficient guarantee of the accuracy of the dates and records. The turf is covered very fully, and in matters of interest to trap and title shooters the notes are copious, and selected with discretions by the content of the content of the content of the content of the price is ten cents, and in any one of its departments its worth far above that foure.

Wricket.

Wisden's Cricketers' Almanae for 1880.—We have just received from Mr. John Wisden, of 21 Cranbourn street, London, England, a copy of his "Cricketers' Almanae" for this year. It is a complete record of the full scores and bowling summaries of the principal matches played in 1879. The little book, for though it contains 216 pages, is small in size, is a marvel in its way not only for the different subjects which it covers, but as a reliable and perfect record. Besides the data, which is interesting to all cricketers, it has a full account of the visits of Lord Harris' Team in Australia and Daft's in this country. The price of the almanae is one shilling; it can be had of Lippincott & Co., Philadelphia.

PRESENTATION TO WILLIAM OSCROFT.—On Dec. 16th, a large company assembled at the White Hart Inn, Red Hill, Nottinghamshire, on the occasion of the presentation to Win. Oscroft, by his Arnold friends, of a gold watch, as a mark of their esteem, and a token of his success in the cricket world, especially during the late American tour of Richard Daff's Eleven. Oscroft, who is now thirty-six years of age, first developed his skill on the Arnold ground, and throughout his long and successful entered his friends and admirers have never forgotten that the feeling found expression on Tuesday in the ican tour of tachard Daft's Eleven. Oscroft, who is now thirty-six years of age, first developed his skill on the Arnold ground, and throughout his long and successful career his friends and admirers have never forgotten him, and this feeling found expression on Tuesday in the presentation to bim of a handsome and valuable gift. This distinguished cricketer may now be considered at the zonith of his fame, as he was the highest average professional scorer last season, which form he kept through Daft's tour, the being the top scorer among the premier cricketers of England. A dinner preceded the presentation, which was attended by over a hundred persons. Mr. Gouncilor S. Robinson presided, and among those present were Mr. J. P. Ford, Mr. R. B. Spencer, Mr. Herbert Walker, Mr. W. Lamin, Mr. W. Williams, Mr. S. Fisher, Mr. James Acton, Mr. W. Williams, Mr. S. Fisher, Mr. James Acton, Mr. W. Williams, Prilipps, &c. In addition to Oscroft, there were several professional cricketers present, including J. Selby, F. Wild, J. Oscroft, A. Anthony, Jas. C. Shaw, etc. Tho usual boats having been proposed, the Chairman next read several letters apologizing for non-attendance; among those who sent being Messrs. R. Daft, R. L. L. Steegman, G. M. Royle, E. Oscroft and R. Howett. L. his letter, R. Daft assured the Chairman that Oscroft's conduct both in America and at home fully deserved any compliment or kindness they could show hm. The Chairman then presented the testimonial to Oscroft, and in so doing, said it was intended by the inhabitants of Arnold as a token of their esteem and appreciation of his merits. (Loud cheers). The testimonial would have assumed a greater magnitude had not the subscription list been confined to the village in which Oscroft was born. The Chairman then presented the testimonial to Oscroft, After some further remarks the Chairman made the presentation and proposed Oscroft's health, after which Mr. Councilor J. P. Ford followed: When his friend Richard Daft and himself took out the team to America, th

they had invitations to come again at some future time. He commended on the fact that the Irish team, then out in America, declined to meet the Baglish team, although they had promised to do so, and notwithstanding that there was a general desire for the match. For his part he should look back with pleasure on the tour during many years to come. If there was one more than another in the team whose conduct was more steady and respectable than another it was William Oscroff; his quiet demeanor, good character, and excellent cricket earned the respect of every one he met with. Mr. W. Oscroff, who was received with loud cheers, thanked his Arnold friends for the valuable present they had made him; he should forever cherish this present, and he hoped long to wear it. He thanked the Chairman and Mr. Ford for the remarks they had made concerning his they had invitations to come again at some future time hoped long to wear it. He thanked the Chairman and Mr. Ford for the remarks they had made concerning his conduct. When he went out to America he went with the intention of doing the best he could for his native village and his county, and he was glad to say he was now well recompensed for it. He thanked the committee and the donors, and also those who had by showing their faces that night_manifested their appreciation of his conduct.

A REVOLVER HEARD FROM .- New York, Feb. 9th-Editor Forest and Stream:—In your issue of the 5th inst. I notice your report of the annual meeting of the Staten Island Cricket Club of this city. After mentioning the amendment of the by-laws prohibiting members of other chubs who are members of the Staten Island. Cricket Club from playing against the Staten Island Cricket Club, you comment thus:—"This reform was much needed, not Club, you comment thus:—"This Fetorm was much mecuca, not only to stamp the chile's identity, but also to protect one or two other kindred organizations in this city." Now, Mr. Editor, with all due respect to your opinion, I very much doubt if this amendment can be termed a reform; nor do 1 see what protection it affords any other organization. Judging from the reports of the afforcis any other organization. Judging from the reports of the Staten Island Cricket Club in your paper and its great increase of membership. I should hardly think its by-laws needed any amendment in this respect, and apart from protecting kindred organizations in this vicinity, it seems bent on protecting itself, and there it ends. It doesn't fight to save its friends.

If I interpret it rightly, it bars its own members, who are mehers of another club, from playing against it? Now it seems to me if a man has belonged to one club for a few years and then joins the Staten Island Cricket Club and these two clubs were about to play a friendly contest, there is nothing unsportsmanlike about to play a trienally contest, tuere is noting subportsmininte or uncricketilke in that individual playing against the Staten Island Cricket Club; nor do I see how it affects any other or organization except the unforture ate individual who belongs to both clubs and who, having paid his money, is not even permitted to "take his choice," but to play with the Staten Island Cricket Club. against the club which has the prior claim to his skill (i. c., if he against the club which has the procedum to his skill (i.e., if he has any) or not play at all, but simply "look on." And so, Mr. Editor, I fail to see the reform In this amendment, and I fail to see how it will benefit the club or the game of cricket, and especially in this country, where the game is in its infancy, and the less restrictions the better.

A MEMBER OF MANY CLUBS. At this time we refrain from any observations on the above believing that an answer from one of the non-revolvers will be sufficient for the "Member of Many Clubs."

AVERAGES FOR 1879.

MERION CRICKET CLUB.

THE official report of the Ground Committee of the Merion Cricket Club of Ardmore, Pa., as presented at the recent annual meeting by Mr. Richard H. Redly, Chairman, shows that:
"The club played in all nineteen matches during the past season. The first cleven played five, of which it won three and lost two. The second eleven played from the committee of the second server by the second seven. During the summer the second cleven had visited New York and defeated both the St. George's and Staten Island second York and deteated both the St. deepres since stated issuing second elevens. The club, for the first time in its history, had played on its own ground two foreign matches—one with the Gentlemen of Ireland and the other with Daft's team of English professionals. The grounds had been inclosed, and this year improvements and additions to the club-house and grand-stand were in contemplaadditions to the club-louse and grane-stand were in contempa-tion. The season had been a prosperous one, the club's list slow-ing that seventy new members had joined since the last report." All this is very good, and we congratulate the Merion gentlemen on their club's success. We are, however, surprised to learn from the above that the first eleven only donned their flannels five the above that the first eleven only domine their landless are times during the season, though we presume the international matches interfered to an extent with the club's regular fixtures. The cleven began by defeating the Young America Club, and this should have been a sufficient incentive to have played more matches during the spring and early summer. The second eleven them, but on account of the "Issing generation" of creacess who need our constant care and patient training. Although we take great interest in the doings of our young friends, yet our heart goes back to the older ones, who through thick and thin have done so much to keep the game alive in its darkest hour.

"Bear lightly on their forehead, Time! Strew roses in their way! The young in heart, however old, that prize the present day, And wiser than the pompous crowd, are wise enough to play

And wiser than the poupous crowd, are wise enough to pla "I love to see a man forget his blood is growing cold, And leap, and swim, or gather flowers, oblivious of his gold, and mix with children in their sport, nor think that he is of I love to see the man of care take pleasure in a toy, I love to see him row or ride and tread the grass with joy, or hunt the lying cricket-bull as lasty as a boy."

After all, a cricket match is not as much a matter of life and death as may be supposed. Of course it is pleasant to be with the death as may be supposed. Of course its pleasant to be with the winners; but where is the game that one side or other does not lose? If with the unlucky ones, look cheeful, and say with Jacob Faithful, "Butter luck next time." Why, for the fear of being defeated, debar from some old cricketer, who has set his heart on a game, the pleasure of hearting his old homes crack? neart on a game, the pressure or nearing his out nones cruck. Thus even a cricket committee has an excellent chance for rutil-izing the golden rule, the doing of which will add more to the popularity of the game than the measuring of every one by its own individual one-inch tape. We claim that all members of a cluth, from the old gentleman who is placker enough to turn up on our cricket fields, down to the modest, timid boy, should have an our cricker lierus, down to the mooest, time noy should nave an equal chance given them. Do not all lovers of the game uphold that both old and young can take a hand? If this is the case, why not carry out the doctrine if it be sound and true? In a country where the game is so new that many of its original founders and still allve, it is but natural that many old players should he customs of the past. Let the rising generation re-

number this, and the old boys that the young ones are to fill their places, and all will be well.

We learn that Mr. George Ashbridge, one of the leading spirit

We learn that Mr. Goorge Ashbridge, one of the leading spirit of the club, has retired from the management, finding that the committee business interfered with his usefulness as captain. Mr. Ashbridge has acted wisely; it is about one man's work to successfully bandle a first-class eleven, and to keep in trim, so as to remain on it. No member of a club needs more practice and attention to the club's practice than its captain; be is looked up to by his eleven, and his frequent failure to "come off" has a de-

Through the courtesy of Mr. Edward F. Sayres, the club's Secretary, we are enabled to give the averages for the past season.

MOUND CITY CRICKET CLUB .- This well-known St. Louis, Mo. MOUND CITY CRICKET CLID,—Into Weit-known at Louis, and, club has now, a member's list of over ninety members, and is able to place in the field one of the strongest elevens in the West. It is in a flourishing condition, and is hopeful that one of the cricketis in a nontrishing condition, and a subject in the close view of the important properties of the fast will visit the West this season and try conclusions with them. The officers of the club are as follows: President, George Bains; Vice-President, Colonel Joel; Treasurer, F. Jullian; Secretary, W. H. Chambers. Committee—A. Leslie, W. Fortes, F. Hackey, and J. Crutwell. The Captain is Leslie, W. Fortes, F. Hackey, and J. Crutwell. The Captain is A. S. Trelora, well-known in cricket circles as having brought out the English Clown Cricketers in 1876, and as sometimes playing with the Peninsular Cricket Club of Detroit, Mich.
The Northwestern American Eleven.—Early in August of last year we noticed in our Cricket Column that a movement was boing made at Montreal to raise an eleven of cricketers to visit.

being made at Montreal to raise an eleven of cricketers to visit England. This has culninated; and the Northwestern American Cricket Eleven is the result. The management of the team is in the hands of Mr. Miller, and the eleven, which is now being formed, will probably sail in April.

INITED SEATES YS, CANADA.— The Toronto Mall, which is considered the cricket paper of Canada, says "the FOREST AND STREAM'S article on the formation of a Canadian Cricket Association is a most valuable suggestion, which Canadian cricketers would do well to take to heart, and endeavor to utilize." Indoorsement from such a source as this is indoorsement indeed. If, therefore, the McKenweig Canada of the Hamilton Click would lake this from such a source as this is indorsement indeed. It, therefore, Mr. R. Kennedy, Captain of the Hamilton Club, would take this matter in hand, Canada for once would turn out a representative team. Mr. Kennedy has had the experience of a visit to the States, and, when here, he demonstrated that he was not only a good ericketer, but an excellent immager. As Hamilton has proved the crack club of Canada, they should take the lead in this

-Wyeroft, the swift howler, has been engaged for the segsor by Lord Sheffield to conch the Sussex Club. He is to be paid very liberally, to have fishing and boating, and to be silowed to play the all the great matches at Lord's, and to have certain other privileges, which causes the envy of all the professionals in England.

Pachting and Boating.

BUFFALO YACHT CLUB.—The editor of these columns returns his thanks to the members of the B. Y. C. for his recent election to the club as an honorary member. Yachting is rapidly developing on the lakes, and the B. Y. C. will put forth all its energies to maintain the high place it now occupies among the promoters of the sport in the West.

YACHTING NEWS.

YACHTING IN FRANCE. - Our transatlantic contemporary, Le FACHTAG IN PIRACE.—OUR TRANSMANDIAL CONTENDORSE, LE Facht, has published its second "Annual," a little volume full of interesting and valuable material to French yachtsmen. What with complete tide tables, magnetic variation, calendar, list of clubs, knotting and splicing, French harbors, etc., the book is cortain to be found in the Skippers' libraries of the rapidly increasing fleet of Freuch yachts.

JERSEY CITY CANOE CLUB .- At a general meeting of the Jer City Conoe Club, held in Jersey City on the 11th day of February the following officers for the cusuing year were elected:—Commodore, Chas. E. Chase: Vice-Commodore, Robt. D. Wynkoop modore, Chas. E. Chase; Vice-Commodore, Robt. D. Wynkoop; Secretary, Edward A. Ransom; Treasurer, B. Frauk Newton; Measurer, Robt. J. Wilkia. The Executive Committee consists of the Commodore. Vice-Commodore, Secretary, Treasurer (ex-a@clo) and Marcus L. Higginbotham. The Regatta Committee are Wm. Y. Fitch, W. Harry Potts and Karl F. Bergman. A Finance Committee consisting of Marcus L. Higginbotham, E. A. Ransom and Wm. Y. Fitch was appointed to investigate and report at the next genoral meeting, on the 10th day of March, as to the building of a club-house. A committee was appointed to arrange with the New York Canoo Club for canoe races on every Saturday. The Jersey City Canoo Club was organized one year ago and now has a fleet of twelve canoes, with many more in prospect this season.

BUFFALO YACHT CLUB .- Officers for the year: -- Commodore C BUFFARD I ALM COEB-Officers for the year: --Commondor L. Bryant, of yacht Cypurct, Vice-Commodore, C. M. SLOOP, CUTTER AND CENTER OF GRAVITY.

Mr. Center having given a reason for his unwillingness to accept my proposition to Volante or any other 40-ft. keel yacht, it but remains that I should thank him for his unintentional indorsement of my claim that the well-designed sloop is handien more easily managed than the cutter. Mr. Center beng known as a long-time amateur tar, his opinion carries weight. From Mr. Center's standpoint—the deck of a cutter—my prope sition that two 40ft, yachts, handled by two men each ake the circuit of Long Island in rough weather, is perhaps a wild one.

I am well aware that the cutter would require from four to six

men if any speed were expected of her, but whether Mr. Center knows it or not, my boat-which is not a sharple after all—can ac-complish the trip easily and speedily with one man and a boy for

This covers the whole ground of my claim as to the relative erits of two the types of boat. Roslyn, Feb. 9th.

THE NATIONAL YACHTING ASSOCIATION.

In a recent issue we publish a letter from the Honorable Secrectary of the Royal Nova Scotia Yacht Club, setting forth the fact that his club sailed more races in 1879 than any other in

It is little to the credit of yachtsmen this side of the Canadian horder that the Halifax club, with a much shorter season, should take the lead in yacht-racing on this continent. Their entries are nearly all cabin yachts, we believe, and go to show how much sport can be got out of racing, when a sensible rule of measurem fixed ballast, and the authoritative sailing rules of the British Y hixen panists, and the authorizative saming three of the bright it.

R. A. are enforced. Comparing the activity, the large-percentage of the total fleet entered, the successful management of this club, with the meagre display of fighting flags and the faint hearted racing among our large clubs much more favorably situated, it becomes only too evident that, as racing yachtsmen, we have quite as much to learn as we have as cruising tars. There we have, on one hand, a population of not much over 50,000 supporting in Inclement waters and a short season an energetic club of cabin yachts which sailed eleven races in one year; und here, in New York, with a million or more to draw upon, the leading cluthey for a manufacture and appear the advisability of giving up racing alrogother, and the other clubs are equal only to a race or two, and one club not even equal to a single match or a solitary

uise: And in face of such an exhibition so unfavorable to ourselves, And in face of such an exhibition as manyonine to buller use there are individuals so blinded by narrow "spread-eagle" prejadenes to claim that in yachting, racing or cruising. Amorrae lends the world, when, in fact, we are behind every mutou which follows the sea for sport, especially in view of our unequalited facilities for indulging in all the branches of this pastline. The corn might just as well be acknowledged; there is no sense in pretending what we are not. How is such a condition of backwardn

to be explained?
First: The abominable, lubberly custom of shifting balla among the junior clubs deters real yachtemen from building small cabin crafts (the nursery of the seaman) to be enrolled upon small cabin craffs (the nursory of the seaman) to be enrolled upon their club books, for the honest yacht with the sailor-owner re-ceives no sympathy from the snad-bug athletes, and the larger clubs debur from their books all ships of moderate tonnage, either by stamute, as in the N. Y. Y. C. and E. Y. C., or by the overwhelm-ing interests of larger yachts which overshadow the little fel-lows' efforts to such a degree that they are left out in the cold, lows' efforts to such a degree that they are lett out in decom, and yet have not strength or enterprise enough the form a genuine racing club among themselves, in which not the length of one's purse, but a spirit of pluck and emulation in seamanship shall nstiture the cementing influences.

constitute the cementing indicances.

Scoond. The prevalence, in consequence of the above, of a type of broad and shallow "open bouts," unfit for most the dutler rightfully to be expected from a yacht, and in reality more "sailing machine" than cruising craft; incking in the most ordinary requirements of storage and convicts. quirements of stowage and comfort; discouraging cruising d "yachting" in the full meaning of that term among owners and 'yaching' in the thin tenthing of the transfer in the thing of small craft; unbandy in rig; dangerous and treacherous in qualities; costly and generally worthless; contributing to the advance of nothing, unless making business brisk for the under-

taker of the nearest town.
Third. The want of combined action, the localism and Third. The want of commercial action, the boundard and of-siam which demands of covery tillage owding half a score of yachte— boats is the proper term—the needless expense, red tape and budierously liberal distribution of office entailed by the formation of a "chth," instead of joining a strong and established union of the kind in some other port. The low fees charged for entrance the kind in some other port. In now trees thanked to change the majority of these infant organizations on the brink of financial distress from the very word "go," and necessitating rating for picapune purses and financial distress the short-sighted custom of opening entries only to the burelold wonders that happen to constitute the "club."

to the bucoits woncers that happen or constitute the carbon. Fourth. The tendency to make society affairs, excursions and drinking bouts of match sailing, usually at the expense of the club instead of those participating in the social excesses.

Fifth. The practice of putting society leaders at the head of affairs, instead of active and experienced sailing members, and

meral encouragement of the former class at the expense of

the latter. Sixth, The distressing mixture of classification and time allow near and substraint matter of cassing an an arrange more and substraint rules; to want of confidence among owners at their stayery to sulling masters, and the stunting of the Anglo-Baxon's love for enterprise and adventure, traceable to the incapacity of our present models to safely take to distant cruising pacity of our present mones to sately take to distant ordising unless of large enough tomage to overprover the seas they are likely to meet, thereby confining "going foreign" to the limited class fortunate enough to possess "big" oraft. Taching in Americal's by no means what it might be—what it

ought to be. The National Yachting Association has a heroulean task before it, and work enough ahoad for many years, if it is to be true to its duties, and live up to public expectation. On all the above subjects its volce should be heard in time. When fully constituted and safely established, the National Yachting Assoelation will have upon its shoulders the responsibility of lifting the sport from its present crude and desultory ways to nathe more dignified, more popular, beneficial, logical, liberal and

NATIONAL YACHTING ASSOCIATION.

Editor Forest and Stream :-

The committee representing the yacht clubs who initiated the The committee representing the years cities who initiated the movement for the formattion of a National Yachting Association have decided upon calling a meeting of the delegates appointed by the clubs, to be held on Monday, March 1st, at 8 o'clock P.M., at the St. Denis Hotel, corner Brondway and Eleventh street. Yacht clubs who have not yet appointed delegates are respect-

fully requested to do so before the 1st of March, in order to have mplete a representation as possible. JOHN FRICK, Sec.

A NATIONAL RULE OF MEASUREMENT.

Editor Forest and Stream:—

In your issue of the 6th inst. a discussion has been inaugurated which is of more importance to yachting in American waters than any other. I refer to the true method of "measurement." It seems to be conceded that what is needed is some measurement. which shall not encourage the construction of a class or type of yacht in which the qualities most desirable in a sea boat must be naterially sacrificed to insure her winning races. It is admitted that the English method of measurement has resulted in the ouilding of one kind of yacht for rucing and another for cruising. binding of one kind of years of recass and abnormal construction in order to win in their races? On the other hand, the American measurement, based upon length alone, appears to be equally vicious. It obliges the yachtsman who ex-pects to win in our summer winds and waters to give his craft an

pects to win in our summer which into success to give us or craft for shormal breath of beam, which impairs her seagoing qualities. Such rules of measurement must be injurious in their ultimate effects upon this fascinating and manly sport. It reduces the yacht to a racing machine, in which no man cares to cruse for health and recreation, in preference to a good "all round" craft. Of the two other methods of measurement referred to by Mr. Smith, that of "euble contents" and that of "length and beam," it seems to be admitted that the first mentioned is theoretically and practically correct when applied to yachts of the same or sub-

ntially the same freeboard. In such cases no yacht, whatever

summing the same freeboard. In such cases he years, where ye be restyle or type, is handicapped in any way.

But when one yacht has more freeboard and better seagoing qualities, she gains nothing in racing qualities thereby, but rather oses on account of the center of effort being higher, and yet she s handiegoned by all the additional cubic contents her increased is handicapped by all the additional cubic contents her increased freeboard creates. This is a fair statement of the argument and of the difficulty encountered in the "cubic contents" system from those who have tried it. As to the other system of measurement—"length and beam"—if I understand Mr. Smith, he admits that theoretically it gives an advantage to the narrower beam or "cuber type" of yacht model, but thinks our summer weather will be a supersonate the system of the

ter type of ynent model, out thins out summer when the not favor a very narrow type for rading.

To this I am slow to agree. The yachtsman goes in to win, and very properly. That is his hour of triumph. He will crules about in a flat iron-shaped cruft in America all summer and take scomforts as a sea boat and otherwise in order to come all her discomforts is a sea own and other we invited to come out ahead in two or three races. He will marigate a craft of about the general proportions of the same likelying, set edge up, in England all the season and stand the heat, and hatches battened down and decks constantly drenched in a sea way for the same

object.

If, therefore, a rule of measurement is adopted in America which gives advantage to a narrower beam and the American yachtsman finds himself ciphered out by it, what would be the Inevitable result? Summer weather, I believe, would not stand in the way a moment. Our Yankee yachtsmen would take to narrow beam that would deplor better than the prototype; they would shave down the English flat-iron set edgeways until it would hardly casts a shadow, if possible, in order to win.

As a delegate to the National Yachting Association seeking in-

formation, I wish to propound a question or two for answer. Re-

formation, I wish to proposing a question or two for answer. Re-verting to the "cubic contents" system, we have:—

1. A method of measurement that is theoretically and practi-cally correct and fair between two yaebts of however different type, provided they have the same freeheard.

2. Every Inck of additional freeboard added to either of these

the other is only detrimental to her racing qualities.

yachts over the other is only defined as not include quantities although it may be of advantage to her sea-going qualities. If this is so, the question I wish first to ask is, why not leave off all the "cubic contents" due to this added freeboard in her measurement? It would not in a race be unfair to the other yacht. ems to me some rule can be adopted to practically accompusa tais. There is certainly some minimum limit to the free-board of a yacht to render her a docent vessel. Indeed it seems to me that there is a limit, proportional to the length, below which it would not be advantageous to reduce the freeboard. This being so, could not yachts be divided into classes according to longth or otherwise, and a line of freeboard be established for longth or otherwise, and a line of freeboard be established for measurement at a certain height above the water for each class. Then let all the "cubic contents" below a horizontal plane passing through this line be estimated, and the yacht which actually has freeboard extending higher would not have it counted against her in "cubic contents."

Any yacht which was built with less freeboard than the height any yacut which was built with less freeboard than the beight of this measurement line would prohably lose more than she would gain, because, without doubt, she would not be fit for any average aca, and she would lose by the submersion of less counter aft when by the wind.

aft when by the wind.

Or if advisable, any yacht so built might have her "cubic contents" estimated, as if she was built up to this measurement line, on the ground that she could not be a suitable vessel unless obuilt up, and should be handleapped for her departure from ect naval construction.

correctnavat construction.

If in any way we can devise a modification of the "cubic contents" system which shall be fair as between all styles of yachts, substantially it will be of great benefit, because for all the parts of the yacht below the water line this system is conceded to be a e, and having a definite and similar portion of the ya leal with above the water line, and having in the water line itself deal with above the water line, and naving in the hatch the victoria a definite and established horizontal plane to measure (this visible portion from, we ought to be able to reduce the conditions to such an equality as to give fair play to any construction of naval architecture in comparison with any other.

Let us hear from the champions of each system, and we shall bly learn from the discussion. DAVID HALL RICE.

MEASUREMENT

IN order that a question is imple enough to itself, may be explained to the best advantage, it will be advisable to first obtain a clear understanding of the purposes to be kept in view. The object, and the only object, of measurement and time allowan co ommong yachts is to eliminate differences of size, so that the real comparative value of various models may be established by the test of racing.

It is quite manifest that if one vessel outsails another smaller It is quite manness that it one vessel obtains action of the relative merits of the two, until a correction has been applied to the larger one, and whereby the effect of her excess in size will be elim-inated—wiped out, as it were. The result as it would then stand represents a just comparison of the value of the models for We established from this the first axiom :-

speed. We established from this the first axiom:—

I. Measurement and time allowence are applied for the purpose of eliminating differences in size, and for that purpose only, so that variety in size may not be a hindrance to the practical comparison of variety in slape.

The object settled clearly in our minds, the next step will be naturally disorded to the process haveled.

Intercoper settled clearly in only initial, the next set measurement and time allowance are to be attained. That the reasoning adopted shall be logical and free from all secondary disturbances whereby side issues would be created, we will dovote attention to the simplest and plainest case imaginable. A, and B, desire to match their yachts for the purpose of deable. A. and B. desire to match their yachts for the purpose of de-ciding whether A.'s Finhèle, of 100 tons, or B.'s Shelback, of 120 tons, possesses the lines or shape most favorable to the develop-ment of speed. The secondary considerations of wind, tide, sailorizing, foul bottom and the like, we presume to be equal in both yachts, so that the question at issue will not be over-standowed by irrelevant matters. The race is sailed, and Finhack leads by 10m., at the finishing line. It will not be pretended that the 10m. represents a correct gauge of the superiority in point of speed of Finhack over Sheliback, for the latter has had the ad-vantages of the momentum due to her excess of twenty tons. If, with this advantage in her favor, the viral Finhack has, neverthewith this advantage in her favor, the rival Finback has, neverthewith this advantage in her layor, the frest product has, hereful-less, beaten her by 10m, the question becomes, by how much more would she have been beaten with the momentum of twenty tons ("power," among yachtsmen) obliterated? The answer to this is to be looked for in the tabulated allowances which experithis is to be looked for in the tabulated allowances which experience has shown to be the amount due as a correction for the excess of 120 tons over 100 tons. When this "allowance" has been added to the actual period (10m.) by which the larger boat has been outstilled, then we will have a correct expression in time of the difference in the value of the two vessels' models for speed. Certainly nothing can well be plainer than this, and since sound logic compels us; to allow for differences in size, our second axiom tollows as a matter of course!—

II. Size is the correct basis upon which time is to be allowed, and Preserore a theoretical course in measurement must be

therefore a theoretically correct system of measurement must be

If a little digression be permitted, we will here explain a phe nomenon, common enough in practice but explicable upon a ra-tional basis to comparatively few, and also thereby meet an objection which we know will occur to almost everyone when try Joetion which we know will occur to almost everyone when try-ing to accept, for once and all, the two axioms above mentioned. We allude to the well-known fact that size per se is an advantage altogether apart from model, and that size should be paid for to the full extent, even though the excess may be used for filling up a vessel's model, and deteriorating from her speed. To obtain an accurate and correct estimate of her altered model in competition with another, it is necessary to make her account in full for the increase of size, in spite of such increase havingered interf

with speed, for an increase of size of itself carries with it an inornage of 'pown,' no martese of the street of the artes with it at more ago of 'pown,' no martese of street, and time allowance is granted, according to axiom L, for the very purpose of neutralizing space and a difference in power, and point in the resulting space. A little relection on this point may be included in a constant of the resulting to have axiom I, before their eyes that many confound, the purposes of time allowance, and declaim wrongfully against making a vessel name anowance, and account wrong thry against making a vesser pay for heavier toning o because the excess may not have promoted her speed—in fact, may have made a slower boat. But then it is just to find out how much slower than another she may have become that she must, nevertheless, pay for her mereased size. This come that she must, nevertheres, pay to it inclusions the samulate clearly understood, and anyone wishing to advance a scheme of measurement and allowance must first master this proposition, and never get astray, or his logic will not bear the crucial test of close reasoning.

Why a larger vessel has a natural advantage over a smaller one till be gleaned from the following figures:—

| Tonnage. | Speed. | Momentum. | Ratios of Resistance |
|----------|----------|-----------|----------------------|
| 100 | 2 knots. | 200 | Say 2. |
| 200 | 2 knots. | 400 | Say 3. |
| 100 | 6 knots. | 600 | 18 |
| | 6 knots. | 1,200 | 36 |

The comparison is made between schooners of 100 tons and 200 tons. Assume that a certain wind will drive both alike fast (2 knots) owing to the larger one having a somewhat clumsier form, and that their resistances can be represented by 2 and 3 respec-tively. When the speed of the two has increased, let us say, to 6 knots, in consequence of a freshening of they wind, the momenta will have grown from 200 to 600 and from 400 to 1,200, exhibiting a much wider limit at the higher speed than at the lower.

| Speeds. | Ratios of Re- sistance. | Difference: | Ratios of Dif- ference to Re- sistance of smaller vessel. | Resistance due to difference of |
|---------|----------------------------|-------------|--|------------------------------------|
| 2 | 2-3 | 1 | 0.5 | { 200 (400-200) |
| 6 | 18-36 | 18 | 1.0 | 400 (200x2) |

If the whole of this increase in momentum be necessary to overcome the increased resistance offered by the clumsier model, then the two vessels will still remain sailing side by side. If, howthen the two vessels will still remain sailing side by side. If, however, only a portion thereof is required to balance the increased resistance, then the remaining "power," or momentum stored up will serve to dr. ve the 200-tonner at some speed greater than stands, and she will force ahead of the smaller schooner in spite of the latter's finer model. To continue upon our assumptions: The resistance in ordinary models increases as the square of the speed at low velocities, hence that of the 100-tonner will at six koots be represented by eighteen. That of the 200-tonner, however, we accept as increasing in a slightly faster ratio owing to bluffer form, and if taken as the 24 power of the speed will amount to 36, as noted in the second table above. The same table shows in the third column the differences between the resistances s in the third column the differences between the resistances and in the fourth those differences have been referred to the resistances of the smaller schooner. Now it is ovident that if at two knots an excess in momentum of 200 was required to overcome the larger vessel's clumsiness, the amount required at six come the larger vessels claimsness, the name requires what knots will have increased above 200 in the same proportion as the ratios 0.5 and 1.0. In other words, 400 out of the difference be-tween 1,200 and 600 will be used up in overcoming the excess of resistance due to inferior form, leaving a momentum of 200 as

a greater speed than six knots, from which it follows that when

a gross-rapear usequires that rate the 300-tonner will go by her. From the above it will appear plain enough that to obtain a correct expression of the superiority of the smaller vessel's form for speed the larger one must be made to account for her total expression of the order of the smaller of the smaller count for the total of the state of the state of the smaller of the smaller count for her total counts. Excess of size (no tons, for the whole no tons has come into pay—first, in making up for want of good form; and second, in actually driving her ahead. In estimating the difference between two forms it is manifest that difference in size must pay, no matter where found. Axiom I., therefore, holds in all cases.

The next requisites will be granted by all without argument

III. A perfect system of measurement for time allowance must not place a premium upon any one form in particular, but must leave the designer absolutely untrammeled in all directions alike.

Any rule which takes into account only one or two dimensions necessarily compois the designer to extend in the directions or direction not raxed. Only one special form or type can be the outcome of such a rule, independently altogether of the design. bility of such type for other purposes than evading just compensation to rivals in a race. Ample proof of this is to be found abroad sation torivals in a race. Ample proof of this is to be found abroad and at home. In England, where length and beam are taxed, yachts grow narrower and deeper from year to year. In America where length generally supplies the standard, yachts grow shorter, stumpler, wider and deeper with each succeeding sum-mer. On the other hand, the Royal Nova Scotia V. S. shuls its system. in which all three dimensions are considered, not only th oughly satisfactory from a theoretical point of view, but capable of matching the greatest varieties in type from one extreme to the other

1V. No system of measurement should be permitted which has a tendency in practice to produce undesirable or dangerous pseuliarities.

No words need be wasted upon this. If it is found in practice No words need be wasted upon this. It it is found in practice, as has been asserted, that measurement by size has a direct influence upon freeboard, and will compel owners to cut it down to the minimum permissible for summer rading thereby losing in oruising comforts and endangering their vessels in squalls and orusing controvs and enongering their vessels in squalis and short sens, it is not very difficult to circumvent this objection. Adopt a standard "depth for measurement" for different classes or sizes of vessels, make such depth depond upon lought or other suitable factor, and the yacht designer will at once build up to the limit and not short of it. Danger will at once and and its other of the free build up to he removed.

V. The system must admit of ready application and verification in

Though the exact size of a vessel is to be attained only from drafts or plans, a sufficiently approximate rule can be devised for every-day practice which will place the adoption of a theoreti-cally correct system within the capacity of the smallest club. cally correct system within the capacity of the smallest club. Substitute for the gauging or calculating of cubical contents the simple multiplication of the three principal dimensions, length, beam and "standard depth," and the whole problem has been solved. A tape line, a plumb bob and a man who can read numbers is the whole stock in trade. Such a rule is founded upon logic and common sense, is unassailable mathematically, and is the only one which will in addition conform to the domands of

the only one which will in addition contour to the domains of the five axioms mentioned in this article.

Any rule which does not conform to them is faulty in concep-tion, and certain in the end to prove vicious in effect.

-A cricket match was played at Acapulco, Mexico, in 1876 with a temperature of 135 degrees in the

Parmechenee and the Bangeley Circuit.

OUR party, consisting of N. A. Roberts, F. Stevenson, Jr., F. S. Fay and the writer, left M— or the morning of Aug. 19th, 1879, for the woods. At Boston we purchased a round trip ticket for eighteen dollars, and taking the Eastern Railroad at 8.30 A.M., reached Portland at 12.20 P.M. At this place a portion of the train is transferred to the Grand Trunk depot, thus avoiding expense of carriage across the city. At the Grand Trunk depot a fair dinner is furnished for fifty cents, and at 2 P.M. the traveler resumes his journey, via the Grand Trunk Railroad. Sixty-three miles takes him to Bryant's Pond, where he arrives at 4,20 P.M., and there he finds a coach in waiting to take him to Andover, twenty-one As soon as the coach is loaded we move onward, and in a couple of hours' time we reach Rumford, eight miles inland, where horses are changed, and we get a very comfortable supper. After a half hour's delay the driver cracks his whip, and we resume our journey in the deepening twilight. Shortly after leaving Rumford we move cautiously down the west bank of the Androscoggin River, but when we reach the border, look in vain for a bridge. Before us is a stream of some thirty rods in width, with a brisk current, whose waters are dark and threatening, and over which we are to be transported. There is no ferryboat, only a small floating wharf, just large enough to hold a coach and four, but with no Without ado, however, the horses are safeguards. driven thereon, but fliere they are sure to stop. "Never fear," says the whip; "they don't love the water any more than you do." Fairly upon it, and the ferryman, by means of ropes connecting with a large cable tethered to either shore, draws the nose of the wharf up to the cable, and the current setting against it, it starts like a thing of life, and in a few minutes the horses dash up the opposite bank. The sensation is both exciting and agrecable

Evening is now fairly upon us, and we creep slowly along in the darkness thirteen miles further, over a rough and hilly, but picturesque, road, till we reach Andover, a natter of three hours' journey, arriving usually from 9 to 9.30 P.M. At Andover are two good hotels—the

Andover House, the ancient hostelry, and French's,

Andover House, the ancient hostelry, and French's, lately built.

From Andover to "Arm of the Lake," on the Richardson (or "Welokenebacook") the distance is twelve miles, but no Concord coach takes one there; the road forbids, for it is rough, rugged and rocky, and it requires a buckboard to accomplish the journey. Leaving Andover at 8 a.M. you soon leave denuded fields behind, and plunge into wooded lands, where tall and shapeless trees obscure the sun and partially shut out the light of day, the only opening visible being a rugged, narrow road, which winds its simous course through the unbroken forces.

About noon you emerge from the wilderness to find yourself once more in the sunshine upon the borders of a beautiful lake, the Welokenebacook, where, planting yourself upon a rock or stunp, you possess your soul in patience, till in the distance you see a faint trace of smoke rising heavenward, and soon the little steamer, the Welokenebacook—a mere toy—approaches the landing. An hour is spent after its arrival in "wooding up" and getting things abourd; then the little screw slowly worms you across the lake to Midde Dan, four miles distant in miles and forty-five minutes in time. "Angless' Retreat" is the nume of the new both of the lables with the sunshing is the nume of the new both of the lables with the sunshing is the nume of the new both? you accoss the lake to Middle Dam, four miles distant in miles and forty-five minutes in time. "Anglers' Retreat' is the name of the new "hotel" that, holds out its invitation to receive you, and as there is no "opposition" house here there are no vociferating backmen chamoring in your ears the various hotels they run for; but you get quietly off the boat and pursue the event eneror of your way up a long plank walk to the backwoods retreat, where you are kindly taken in charge for the moderate sum of \$1.50 per day. The old Retreat has outlived its usefulness, and is now falling to pieces from gradual decay. Worms find a home in its rotting timbers, and horses and cattle find protection from the inclemency of the weather beneath its roof. What an ignoble use to dedicate its historic walls to! How many a merry gathering have its timits roof, walls to!

home in its rotting dimores, and norses and cattle find protection from the inclemency of the weather beneath its roof. What an ignoble use to dedicate its historic walls to! How many a merry gathering have its timbers witnessed! How many jolly songs and cheery laughters have its primitive walls reëchoed!

Alas! never more will its dumb sides resound the hearty jokes that went round in those early days when few drank in the glories of this famous fishing ground. But it is not my purpose to moralize, but to paint as nearly as possible an accurate picture of this delightful country; and having reached this point in our journey let me say, taking Middle Dam as the starting point, it is my purpose to give practical information of time, distance and expense of making the Rangeley circuit, if I may be allowed the figure of speech, and at the conclusion of this article may be found a compact summary table for the scrap book of the sportsman.

From Middle Dam there are two routes to Parmechence, viz., via Indian Rock, and the Megalloway. Having chosen the latter my description will be by that way. The old carry from Middle Dam to Umbagog—Cedar Stump—has been abandoned, and the new carry now follows the old road about three miles, when it turns to the northward and strikes the east arm of the Umbagog, five and a half miles all told from Middle Dam.

The steamer Diamond at present makes three trips weekly, starting from Upton about 8 A.M. Thesdays, Thursdays and Saturdays, reaching the arm at 9 A.M.; thence to Errol Dam, and roturning up river roaches Brown's Farms, on the Megalloway, about noon, where a comfortable spring wagon takes you to the farms, two miles distant, for dinner. A buckboard leaves M. D. each and a half miles all told from Middle Dam.

The steamer Diamond at present makes three trips weekly, starting from Upton about 8 A.M. Thesdays, Thursdays and Saturdays, reaching the arm at 9 A.M.; thence to Errol Dam, and roturning up river roaches Brown's Farms, on the Megalloway, about noon, where a comfortable

ing your biggage by buckboard at seventy-five cents per 100 pounds. If you ride, the fare of \$1 includes the carrying of your luggage.

At Brown's Farms you make a bargain to carry you to Fred, Flint's camp, at the head of Ariscoos Falls, seven miles, or previously arrange for boats to meet you at Brown's and pull to the foot of the falls and then carry around. The former is the better way. Five dollars took our party and luggage from Brown's to flint's. From Brown's to foot of falls the road is good, but the carry around the falls is very bad, and luggage must be taken across on a buck and you must walk or take a terrible jolding.

jolting.

milk. Terms, \$1.50 per day for sportsmen and \$1 for guides.

At 6.30 A.M., Aug. 23d, we shoved our boats into the current, and the strong arms of our guides began pulling us up the Megalloway. The river at this point is some eight or ten rods wide, with no perceptible current upon the surface, yet with a strong undertow. Four miles the hour is called "good time," and as the distance to the foot of the Little Megalloway—where you disembark—is thirty-three miles, it's a pretty good day's work to make the river in one day from Flint's Camp.

The points of interest between Flint's and the Little Megalloway, i. e., the fishing points, are, from point to point:—Flint's to Beaver Brook, two miles; Parker Hill Pond Eddy, two miles; Bog Brook, one mile; Narrows,

four miles; Hunter's Camp, five miles; Lower Metallic Pond, one mile: Foot of Meadows, four miles; Upper Metallic Pond, five miles; Head of Meadows, five miles; Foot of Little Megalloway, four miles; total, thirty-three

were anxious to make Danforth's Camp by As we were anxious to make Daniorth's Camp by nightfall we omitted fishing en route, and at 12.45 r.m. we found ourselves at a camping spot near the Upper Metallic, twenty-four miles from Flint's. Tethering our nightfull we omitted fishing en route, and at 12.46 r.m. we found ourselves at a camping spot near the Upper Metallic, twenty-four miles from Flint's. Tethering our boats to the bushes on shore, we disemburked and soon had a fine kettle of tea steeping over a brush fire. Tea, by the way, is the nectar of the guides; give them plenty of meat and they will pull as long as the oars hold out; and right here is a good time, while we are waiting for the pot to boil, to say a kind word for our guides, John Eastman and John Olsen, both faithful, trustworty and reliable guides, and thoroughly familiar with this section of the country; ever willing to do all that is required and strictly temperate in their habits, both denying the use of ardent spirits. Waile waiting for steam to get up—in the teapot—we visited Metallic Pond to look for deer; we saw a fresh trail, but the deer which made it was non est, so as the law "was on" we didn't shoot him. After a hasty, but by no means light lunch, we resumed our boats, and lighting our pipes, drunk in the beauties of nature as we lazily and dreamily puffed our way up stream. A word about the Megalloway. It is what might be termed a flat, lazy stream, with clear and creeping waters, bordered on either hand by low lands thickly covered with spruce, tamarack, hemlock, etc., mostly soft wood. Its course is very crooked, and it often "boxes the compass" in a half-mile run. This, added to the wild, ruged aspect of the surrounding country, gives a touch of romance to the journey. Resuming our journey we find nothing of special importance to interrupt our dreamy thoughts till we arrive within three-fourtlis of a mile of the landing. Here we encounter rapids too strong to stem with loaded craft, so we leave our luggage to the care of our guides and find our squalong a well beaten path near the river, while our guides pole up the boats. A delay of some thirty minutes is occasioned by the rapids and we again embark, but only to make about one-fourth of a mile, when we find ourselves, at 3.

"For a team to cross the carry fire two shots, and on being an-wored fire two more. G. S. FLINT.

iney's end by water. Spiked to a tree hard by you will find these words:—

"For a team to cross the earry fire two shots, and on being answered fire two more.

Elevating our double-barrelled Parker at an angle of 45 degrees, we fired in quick succession two shots of buck, then attentively listened, when, after a little, through the brunches of the tall forest trees came the sharp crack of a rifle, when again we gave two more, and in less than thirty minutes there came lumbering down upon us an ordinary stone drag, drawn by a dilapidated-looking horse, which presented the appearance of an animal fed upon the provender of the country, brush. But, mil importe, he took our truck safely over the carry, four miles, to Parmechenee Lake, at the modest charge of five dollars, while we made the same on foot in one hour and ten minutes. The carry, after leaving the Megalloway, takes a westerly course for about one half mile, where you reach "Spoff Flint's Camp," or G. S. Flint's, which is situated on the border of "Sunday Pond," which he has stocked with trout for the entertainment of his guests. His camp is a comfortable one, and, on dif, he sets a very good table. At this point the carry turns northward, and three and one half miles further, over a comfortable but somewhat hilly path, you reach the south border of Parmechenee. At the termination of the carry is erected a flag-staff which boasts a white flag of peace. Quickly to the pinnacle we hoisted the emblen, and in a few moments our eyes were gladdened by the sight of a minuture speek a mile and a half up the lake, which upon appoach proved to be a boat to take us to "Camp Caribou," the name with which Joln S. Danforth has christened his wilderness lodge. In twenty minutes we were all safely stowed, and in twenty more we moored our boat at his wharf, just as the hands of our watches had passed the figure which divides 5 from 6 r.M.

We were greeted by our old guide with an enthusian which awakened the pleasant memories of four years ago, when we first penetrated th

hand. Again he essayed to fell the towering pine to the same end, but again were his labous stayed in their progress, and now he found that a petty jealousy of a camp proprietor below was exercising its influence against his getting a foothold here. Being a strauger, with no influential friends, he was unable to get a permit from the land-owners, while he and his motives were grossly traduced by his jealous opponent. Nothing daunted, however, he now determined to anchor here. So with the indomitable pluck of a master backwoodsman, as he is, he shouldered his ax, marched up the lake, selected a quiet spot where the fierce blasts of the season would not too roughly visit bin, and with a few well-timed strotes laid a goodly number of the denizens of the forest low, and in a short time had constructed a raft of mighty logs, thoroughly secured together as only a skilful woodsman knows how to do. Upon this solid foundation, anchored off shore, he piled his logs and raised his cabin, and ere the winter snows visited him in carnest we find him teasting his weary limbs over a cheery blaze that beanned from his hearth. Man has too much reverence for genuine pluct to suffer it to go long unevarded. His indomitable perseverence wen him the respect of the land-owners, and an acquantance began which ended in a permit to creet his lodge upon a small island at the upper end of the lake, and last winter he gave the finishing touch to his now roomy and comfortable camp.

The island upon which his buildings (three in number) are located contains about one and a half acres in area. All the buildings are framed of spruce, with spruce stud-

an acquantance began which ended in a permit to crect his lodge upon a small island at the upper end of the lake, and last white he gave the finishing touch to his now roomy and comfortable camp.

The island upon which his buildings (three in number) are located contains about one and a half acres in area. All the buildings are framed of spruce, with spruce studding and rafters, and clapboarded with planed clapboards. All of the timbers, studs and rafters are pecled, and, there being no finish inside, their glossy surfaces give appearance of varnish, and render the rooms decidedly cheerful. The main building, which stands immediately in front, is two and a half stories high, 20x30 on the ground. This is occupied by "the family." Mr. and Mrs. Fickett, formerly of Brown's farms, who attend to the culturary department and "run" the hotel for 'Johnny." The kitchen and dining room occupy the first floor, and bedrooms above. Immediately in the rear of the main room is the general comfort room, or guests' sitting room, a building fax20; all in one room even to the ridge. A large open Franklin sends out a mellow warmth into its ample space, while the demudel rafters of spruce glisten and shimmer in the evening firelight. The appointments are simple. A small writing desk fixed against the wall, a buil dozen shelves with a few books and papers, the simpedimente of departed sportsmen, a sink the simpedimente of departed sportsmen, as ink wall, wash bowl and towels, two small tables, a wooden bench, a few home-made chairs and a swinging hammock are all 11st walls are decorated with actual drafts of three large trout, caught here since the camp was creeted, the largest representation having been taken by Henry C. Haven, June 1st, 1879, at Little Boys' Falls, and weighed flive and a laft pounds. Farther back, but to one side of this building, is the lodging camp, 20x30, having six comportable rooms on the lower floor, and six beds, all in one room, in the attic.

Through the long and dreary winter of '18 and '79 "Johnny," wi

pound.

At the outlet of the lake, one and a half miles from

pound.

At the outlet of the lake, one and a half miles from camp, the fishing is fine in June and September, and large trout are frequently taken here. The largest taken by our party weighed about two pounds.

Farther down the stream, about a mile below the outlet, Black Catt Brook emplies into the river and trout are abundant, but not so large as above; however, they are often taken weighing from one to two pounds.

Our party remained at Danforth's itwo days, and, although we had trout at every meal, we had to stop catching, because we could not eat them fast enough.

Parties visiting Danforth's, if they have a taste for something wilder, will find good hunting and fishing in the back country. Trout, deer, and all kinds of game being plenty ten or twelve miles back, or up the Megalloway River. Rump Pond, eight miles up stream, is a favorite camping ground, and parties can get fitted out at Danforth's for the expedition. I would remark in passing, that, to visit Parmechenee, parties need not tak blankets or any outlit whatever for camping out, for they can be had at Danforth's. From the Rangeley Clain to Parmechenee is now but a day's journey, however you may go, unless you prefer to idle by the way, and try the favorite fishing pools which abound along the river banks.

After a pleasant tarry of five days at Parmechenee, we jurned our faces homeward.

At 8.30 a.m., Friday, Aug, 29th, we bade adieu to the pleusant island, and at 9 a.m. we reached the mouth of the Black Cat, two and one-half miles, where the west end of Cupsupic Carry terminates. A few minutes sufficed to pack our guides and gather our own load, and we started across the carry. This carry is called five miles; but I have walked over a great many and value my opinion, and I enter it upon my jointral as eight miles. We were all pretty good walkers and loaded light, and were three hours and five minutes making it. Hils, however, included thirty-five minutes in stops, making the actual time two hours and thirty minutes. En roude we came upon a flock of partridges and bagged the lot—seven. We could not help it, they would not fly; and we shot them down in cold blood, not for sport, but because we wanted them for our supper.

Much has been said about this being a bad carry, but we all pronounced it an exceedingly good one. There is, occasionally, a windfall, it is true, but they are few, and now and then a steep declivity, but they are not many. The underbrush is all cut away, the path well-beaten, and but few rocks beset your footsteps. I wish, indeed, I might never encounter a worse.

Reaching the banks of Chusuntie River about 12 M. we

never encounter a worse.

Reaching the banks of Cupsuptic River about 12 M., we waited thirty minutes before our guides came up. It should be borne in mind that they carried about seventy-five pounds of luggage each, which may explain their five pounds of luggage each, which may explain their

y. rained quite hard at spells while crossing, and we It rained quite hard at spells while crossing, and we were somewhat wet when we got over. We built a fire, however, and as the rain held up we got pretty nearly dry by the time our guides arrived. We found our boats in waiting to take us down the river; and I will remark by the way that Danforth keeps boats constantly at both ends of this carry for the accommodation of sportsmen going and coming.

ing and coming. After a hasty lunch, which all did ample justice to, we After a hasty funch, which all the ample justice to, we shifted our cargo and poled our way down the narrow and shallow Cupsuptic a distance of eight miles, where we encountered rapids, and leaving our boats at the head and shallow Cupsuptic a distance of eight miles, where we encountered rapids, and leaving our boats at the head of the same, again shouldered our luggage and made a carry of a half mile to the foot of the rapids, where other and better boats awaited us. At this point the rain came heavily upon us, and we were glad to avail ourselves of a friendly tent which a brother sportsman had erected here, but who at this time was temporarily away. About 5 1-M. seeing no signs of clearing weather, we donned our rubber coats and pushed our brais into the current. The stream now becomes wider and deeper, and our guides bent to their oars. Shortly after starting the rain came in torrents, enlivened occasionally with thunder and lightning. One of our party discharged his gun, which burst a cloud in our immediate vienity, and its contents threatened to deluge us for a few moments, but by dint of bailing we kept afloat. From the foot of the rapids to Indian Rock the distance is eight miles, viz., four to the head of Cupsuptic Lake and four more across it of Indian Rock, which is situated about one mile up Kennebago stream, where it and Rangeley stream unite to empty their waters into Cupsuptic Lake. The view from the foot of the rapids to Cupsuptic Lake is very delightful, wild, romantic.

Cupsuptic River for most of the way is very narrow.

tiner waters into cupsuptic Lake. The view from the foot of the rapids to Cupsuptic Lake is very delightful, wild, romantic.

Cupsuptic River for most of the way is very marrow and very crooked, more so than the Megalloway, which is so crooked that the water sometimes forgets which way to flow. The channel is shallow and narrow, and at points we had difficulty in getting through the narrow passes, which were choked with the dry float-wood. Along its banks, where sand bars make their way out into the stream, we saw multitudes of deer tracks, and in one instance those of a caribou. Ducks, too, are quite numerous in its waters, but it requires great care to get within shooting distance.

Having reached Indian Rock our journey is nearly over. Camp Kennebago is owned and run by an association of sportsmen who love to angle, and who believemay their tribe increase!—in obedience to law of fish and game. They have two large buildings devoted to their confort (one just finished), besides one for guides and other necessary out-buildings. The Superintendent, C. S. Richardson, romains here the entire year and looks to their affairs. He is a genial, good-natured soul, with proper gifter of filt the position to which to has been assigned. If the position to which to has been assigned of medium height, with beaming face and piercing eye and long gray whiskers and moustache, In looks a very Furfata—a Miles Standish as it were. He greets you with a happy smile and happier word, and during your stay his quaint remarks furnish you an untold fund of pleasure.

Camp Remebago is open to visitors during the season,

stay his quaint remarks furnish you an untold fund of pleasure.

Camp Kennebago is open to visitors during the season, except in June and September, when it is devoted to members of the olub and their friends. The regular charge for board is \$1.50 per day, and they set the best table in the wilderness. The camp is situated about twenty roots from the confluence of Kennebago and Raugeley streams, and some of the finest fishing hereabouts is at this junction where the waters unite. Leaving Indian Roek to complete the lake circuit we pass down the river on the little steamer Oquossoc into Cupsupite Lake, thence into the Mooselucmagnitic, making our first stop at Soule's camp, about two miles from Indian Roek, a comfortable lodge looking out upon the lake, and whose doors are always open—for a consideration—to the sportsman.

from Indian Rock, a comfortable lodge looking out upon the lake, and whose doors are always open—for a consideration—to the sportsman.

Leaving Soule's the steamer makes its way across the lake, eleven miles, when it enters a narrow outlet a mile in length and finally brings up at Upper Dam, where a small hotel and a half dozen other buildings look out upon this narrow neck of water. The fishing at this dam is often very fine, and while we were stopping at the rock Marshall Whitney, guide and tyer of flies, of Upton, took three good trout, weighing respectively six and a half, five and a half, and three pounds.

A carry of one-fourth of a mile takes us to the head of Lake Molechunkenmak, where the steamer Wedeenebacook nakes its connection with the upper lakes. Leaving Upper Dam the steamer passes down the lake above named through a narrow neck of water about a mile in length and into Lake Welokennebacook, or more often perhaps called the Lower Richardson. From Upper Dam to Middle Dam is about ten miles.

I have now given the complete circuit, having started from and returned to Middle Dam; and I have little more to add, to conclude this sketch of the Rangeley section,

Coming in via Andover we determined to go out via Farmington. From Indian Rock across the carry to Rangeley Lake is one and three-fourths miles. Travelers walk and their luggage goes across on a buckboard for St. The steamer runs on the Rangeley every day, Sundays included, and Leaves foot of the lake at 10 A.M. From this point to Rangeley City is six miles, which the lutle steamer Mollychankennuk makes in about an hour, arriving about 11 o'clock. The stage from Rangeley City, however, does not leave till 3 o'clock, thus giving ample time for dinner. There are two hotels here, the Rangeley Lake House and the Oquessoc. The former is auted the larger. Rangeley has a population of about 500 inhabitants.

habitants.

After touching at Rangeley the steamer continues on to Greenvale, at the head of the lake, three miles distant, and passengers can stop at either point for dinner. Greenvale has only two or three house. Rangeley Lake is considered the handsomest of the lakes, but it does not seem to be a few to the contractions.

is considered the mindsomest of the takes, but it were smallered the best fishing.

Leaving Rangeley at 2 P.M. you soon find yourself upon a very hilly and somewhat sleep road—now up, now down, but affording a very fine view of the surrounding country, which presents on either hand lofty mountains and deep valleys. Your progress is necessarily slow, especially as the horses upon this route are none of the

Four miles an hour is a fair average. The first stopping place after leaving Rangeley City and Greenvale is Beech Hill, or half-way house, where we changed horses, nine miles from Greenvale and twylve from Rangeley. About 5 P.M. we renewed our journey, and about 7 P.M. we drove up to the Earden House at Philipps. Med, nine miles from Beach Hill and twenty-one from Rangeley. A word for the Barden-List first class. Philipps has a population of about 1,500, and supports two or three good hotels.

To reach Farmington in time for the train (8.45 A.M.) you must leave Philipps early; so at 4,30 we were called to

three good hotels.

To reach Farmington in time for the train (8.45 A.M.) you must leave Philipps early; so at 4.30 we were called to breakfast, and at 5 A.M. we were smoking our pipes on the stage top just as the sun was putting in an appearance. About 7 A.M. we reached Strong, asmall township, where we crossed Sandy River upon a suspension bridge, exchanged mails, and recrossing, recumed our conte over a rough and billy road. "At 8.50 we drove up to the depot, and at 8.45 we moved out of the station. From Farmington to Porthaud is eightly-four miles, and the train arrives here at 12.57, giving thirteen minutes to connect with Boston and Maine or Eastern for Boston. The trains run into the Eastern Depot at Porthaud, but if you wish to take the Boston and Maine you change at Hoston and Maine transfer station.

For convenience of reference and for the scrap-book I give below a table of distances, time and fares from Boston to Parnichence and return:—

| | | Distance. | T | inc. | Hores. |

I have now, patient reader, finished the task which I set myself about, viz., to furnish information which no guide book contains, yet the want of which I experienced when contemplating this most delightful trip. By its aid you may, with patience, calculate the time vequired and expense necessary to make any trip you may desire. In passing, I would remark that a small party can easily make a two weeks trip from Boston for 360 You can add to this by extravagance out save upon by camping out part of the time. If you attempt it, told the advice of the writer of an article which appeared in the Forest and Stream a few weeks since—its sound

sense cannot be questioned. Make up your mind to begin your enjoyment with the beginning of your trip. Make yo're bargains in advance when you can, and if you know precisely where you wish to go, buy through tickets; you can easily deviate here and there and strike your circuit again. You will find a delightful country and plenty of trout, but it may not full to your lot to capture the large ones. Take such as rise to your fly and rest content. An ordinary shot-gun is of little use, as a rule, for birds, without a dog. They are too tame to fly, and the chances are you will pass without seeing them. For deer, a rifle or gun with buckshot is what you need; at the proper season you can shoot all you ought to with either.

Finally, aim to be a true sportsman, keep your temper, don't bully your guides, and you will be happy and retarn a better man from your intercourse with nature.

GEO, A. FAY.

Autural Historn.

WINTER IN WYOMING.

Como, Wyoming Ter., Feb. 7th, 1880.

Editor Forest and Stream :-

I sent you a little while ago a list of some of the birds which have ventured to brave the severities of a Wyoming winter. Small as that list then was, it has become of late still smaller. For the past month I have looked in vain for a wing to darken the wintry sky. Even our solitary Collurio Ludovicianus excubitoroides, the com mon shrike, has left, and eagles and hawks have either kept at home or gone elsewhere. The weather has been more severe of late than in December.

We notice that on a day preluding a storm, after a very mild one, birds are about, especially birds of prey, and for a good reason, for at the same time there seems a general premonitory stir among the other animals. Sn white jack-rabbits begin to run about, as if seeking for a suitable shelter against the impending storm. Towards evening many of these run frolicking out into the open prairie, and sit on their haunches like specters; then not unfrequently an owl is seen hovering over their playground, while eagles and hawks have been watching them during the day. There is an uneasiness, too, among the herds of cattle, and in our mines we not unfrequently find the abundant footstops of those little marauders, the mountain rat (Neotoma cinerea), showing that they, too, have been on the stir during the night, looking for s thing to steal and amuse themselves with, during the time that they are to be snowed in. Snow-birds begin to appear in small flocks around the railroad station, snow-bunting of late has been the commonest of these. The gray crowned finch (Leucosticte tephrocotis) has not called on us for some time. With the snow-buntings a few days ago, during very severe weather, I saw a shore lark (Eremophila alpestris), the first I have seen doing duty in this region as a snow-bird, though common enough during the summer months, when I have ofter found its nest in a slight depression at the roots of a tufe of grass, especially in Colorado, and later on have caught the fledglings. In South Park, Colorado, at an altitude of 10,000 feet, I have noticed them during the early fall, and thought I recognized some change in their plumage. This specimen was very tame, and was feeding with a couple of snow-buntings around the station at Como. seemed as if its colors were brighter than usual, especially the yellow under the black cravat and the soft roseate

seemed as if its colors were brighter than usual, especially the yellow under the black cravat and the soft reseate hue on the back. like the last blush of a winter sunset on the prairie. Perhaps he was getting himself up with a view to Valentine's day, or possibly the colors may have seemed brighter by contrast with the snow.

One summer day in Colorado, myself and three companions were caught in a terrific thunder and hail storm on the open prairie. We took shelter in a broken-down claim shanty, and anid the rear of the thunder and a perfect bombardment of halstones as large as marbles, a number of these little birds came in under the boards for inhelter and nestled at our feet, fearing less the presence of man than the storm of frozen bullets outside. Mr. W. H. Reed, of Como, who is well known to the readers of this paper as a hunter and closs original observer of mature, asystated once during a heavy snow storm an Erranghila came into his tent and took shelter there for some days, feeding out of his hand and allowing itself to be freely handled. He also relates that one day on passing a bank of drift snow lying against some suge-brush he noticed some little holes in the snow, and on removing the bank he found a hundrel or more of snow-birds of two species—the Erranghila and the Anneo lyemulis, or Eastern snow-bird, and the common snow-bird—hundled together. The holes, he thinks, they had pecked in the snow for air-holes, and the whole party were there completely snowed in, waiting till the storm was passed, reminding one of the sheep in Colorado, which when overtaken in a snow drift are said to work dwind when overtaken in a snow drift are said to work dwind the complete of the sheep in Colorado, which when overtaken in a snow drift are said to work dwind the party were there completely snowed in, waiting till the storm and the found of the sheep in Colorado, which when overtaken in a snow drift are said to work dwind when overtaken in a snow drift are said to work dwind when overtaken in a snow the contras

Such being the premonitory signals of a snow storm among the feathered and four-footed animals, it behooves man to take warning, gather in a pile of firewood, put an extra blanket on the bed, and bethink him how he is going to spend two or three days in which it will be next to impossible for him to stir out. In the night upsprings the northwester; the house fairly rocks; no amount of blankets secuent to keep out the intense cold. In the morning he comes down stairs to find the windows opaque and garnished with strange delineations of ferns and foliage. He would fain warm the handle of his knife at the stove at breakfast, for it is like a chunk of ice. The clocks have all stopped during the night, and everything

that could freeze is frozen stiff. I once tried to paint in

that could freeze is frozen stiff. I once tried to paint in water colors with a red-hot stove at my back; but the brish would throw nothing but fee on the purer. Thermometer is between 20 and 30 degrees below zero, and on Christinas Day, 35 to 38 degrees.

Outside a storm is raging; not merely the falling anow, but a dense cloud of driving drift—so dense that the station, only thirty yards distant, is barely visible. Owing to the rremendous and thmost conseless gales the snow never lies more than a few inches deep on a level in Wyoning, but is often drifted into enormous banks. The trackmen, whom the stem rules of the Union Faelife Railread oblige to, are the only ones to turn out, and they come back at dinner time verifable pictures of oil Father Christinas, beards and moustaches one sheet of ice, and not unfrequently with frozen noses and ears which have to be brought to by a cold application of snow. Large herds of cattle fly bellowing before the storm, and many drop out by the way, and their frozen carcasses dot the prairie next day. At this season they are also, especially the long-horned Texans, particularly ferocious. Many an encounter has occurred this season between our men and teem, in which the genus Hono has been glad to take to the rocks. The bulls do not always have it their own way, however, for one of them happening to meet a stout frish trackman armed with a sledge-hammer, in a railroad cutting, disputed the right of way and charged. The man struck him fair between the eyes, and "Sterat hami box."

track him fair between the eyes, and "Steratt hume box".

The storm generally lasts for two or three days, and is then as suddenly followed by soft, mild weather. Then appear the tracks of all the fauna of Como on the snow. Rabbits have sathled out in the night to call on other rabbits and inquire how they have weathered it; hares have crept out from their thick sage brush to listen to the howl of the coyote, whose tracks are seen everywhere, and in some places a general scurry on the snow shows where some hare or rabbit has doubled on his pursuer. Then again curious little imprints at regular intervals, with a straight furrowed line between them, show where some mouse or gopher has made plunging leaps through the snow, so much out of his depth, dragging his tail after him. Such are the "footsteps of the night."

If the weather is fine a few lawks or eagles may rarely be seen against the sky. Such is a brief sketch of pretty tough winter weather in Wyoming.

A. Lakes,

ABOUT THE BOHEMIAN WAXWING.

CLEVELAND, Obio.

I N November of 1839 I first met with Ampelia garratha, that beautiful, strange, wandering bird, of which so much has been said and so little known. I was in company at the time with the late Dr. Jyred P. Kirtland, and intel has been said and so little known. Twas in company at the time with the late Dr. Jured P. Kirtland, and as a student, was in search of some kind of a bird in order that he might teach me the att of taxidermy. We only met that afternoon with a flock of birds that we supposed at the time to be the common cherry bird (Ampelis cedrorum). By a lucky shot we procured a number for the evening's work, which was spent in skiuming and mounting a pair of them, the Doctor remarking all the while that they were the largest and most extraordinary colored cherry birds he had ever seen; in fact before we got through our work he declared them to be the regular, genuine Bohemian waxwing, which up to this time had never before been taken in hand by an American naturalist. To be sure Dr. Richardson, in his "Fauna Borealis Americana," mentions seeing a single male specimen at the Hudson Bay House in 1831, but was not able to procure it. From his observation Audubon added this species to the faunu of North America. Dr. Kirtland, after his discovery, was not slow to muke it known to Audubon by letter. The returning mail brought an answer that the bird in question must be the common cherry bird, as the Bohemian waxwing was a European bird, and the one mentioned by Richardson was only a wanderer from the Old Continent. Doctor Kirtland then sent to Audubon a fine skin of this bird, but I do not know that the latter took further interest in the natter or even recognized in any way that the bird was common to the country. Until within the last ten years the Bohemian waxwing

know that the latter took further interest in the matter or even recognized in any way that the bird was common to the country.

Until within the last ten years the Bohemian waxwing has been a constant winter visitor here, arriving the last of November in close flocks of fifty to two hundred and more, remaining in certain localities where food abounded through the winter. A few stragglers have been often taken as late as the 1st of May. In December of 1814 I saw a flock of these birds on their way South that must have numbered many thousands by careful calculation. The flock was over two miles long by twenty rods in width. I procured several specimens from among them. The day following this flight was the commencement of the heaviest snow-storm that has visited this locality since. The great attraction for the waxwing here was the abundance of mountain ash berries; every lawn and front yard grow many of these trees; of late they have gone out of fashion, and the waxwings with them.

I have asked of the Park and Cennetary Commissioners to plant the mountain ash so as to call back this beautiful winter visitor.

The Bohemian waxwing does not breed in this region, but I am informed by Captain John Standard (the discoverer of Standard Rock, Lake Superior), that during four years' residence at De Tour, on the Sault St. Marie fliver, he has never missed seeing this bird in numbers during the entire summer months. He believes they nest in that locality, and as Captain John is a good ornithologist and observer, I believe with him that they nest there.

Dr. E. Steinlang.

Our correspondent, J. K. Lum, who writes to us from Skookum Chuck (Oh ye gods!), Lewis County, Washington Territory, about Ampelis garrulus, says :

Numbers of these beautiful birds have made their appearance here this winter for the first time in the history of the country.

YOUNG BIRDS IN WINTER .- In view of the unusual severity of the present winter in Europe, the following notes, contributed by Mr. Frank Norgate, of Sparham, to the London Field of January 31st, have a peculiar

interest. The writer says:—

The following notes, if they do not record any very unusal dates for young animals, seem to me particularly

interesting in such a serere winter as we are having. Had the season been unusually mild, the eccurrence of young birds probably would have been noticed as one of the signs or consequences of such mild weather. I need not give the readings of the thermometer for more than one day, but the winter here is the severest one I ever experienced. In the first work of last November I found a young showourn (about 3in, long) on the road in Sparlam. On the 14th of the same month I dag up three living imagos of Mielotoulia wilqueris. Is it the custom of this species to hybernate in the perfect, slate? Nov. 16, I heard the snoring noise as of young barn owls in the roof of Sparlam church. Do adult barn owls in the roof of Sparlam church. Do adult barn owls more to the cackling sound which I believe is peculiar to old barn owls; Nov. 20, At Holt I saw two young barn owls flowny uestlings) unable to fly. They were dead, but fresh enough for stuffing, and Mr. Dack told me he had two similar ones brought in the previous week. Nov. 26. In Sparham I shot two young weed pigeons with long filanents of down still athering to the upper ving coverts and secondaries. Doc. 2. Thermometer registered half a degree below zero. Dec. 4. I bagged two more pigeon with downy nestlings filaments on its wings. On the 11th of the same mouth two leverels, the size of rabitis, were seen in Sparham. Dec. 12. I saw a barn owl y out of its nest (in Sparham church) a snocing" on the wing, and heard one or more still snoring in the need whilst it was flying away. Dec. 15. A young showourn and three warry newts hybernating att. below the stratege of the ground at the bottom of a gree post. I saw them just after they were taken up with the old poet. Dec. 21 and 25. I heard the snoring noise as of young barn owls as well as the older ones. In the same part of the church roof. Then extra part of the nest and part of the church roof. Then ever were probably more allive, but a great part of the nest was inaccessible, and we only saw the dead one, which was ra

UNIFORM NOMENCLATURE. - We publish below the scheme presented by the Committee on Nomenclature before the late Convention of the Michigan Sportsmen's Association, at Bay City, and which, with the exception of the substitution of the name "quail" for the name "colin," was adopted by the Association. The views expressed by the Committee are founded on the right idea, that of absolutely local names, and substituting the names which belong to the various species, and by which they are known to biologists, the men who may fairly be supposed to know more about the animals than other people do, because they have made the animals their special study. So far as the English names go, what the Committee says is very well, but they have tried to do too much. It is very doubtful whether the masses of the people can ever be educated to the point of calling even our common game animals by their scientific names; and, if they can be brought to this point, it will be just as easy for them to learn the proper names as wrong The various genera into which the grouse, for example, have been divided, are generally excepted by ornithologists and should be employed; and the same is true of the deer. If we are going to try to teach people, let us teach them what is right in the first place, and thus save double labor :--

double labor:—
DEER GENUS.—Elk. Cervus alcon, commonly called moose. This animal is identical with the elk of the old world, and should be so called, although his native American name, moose, is not a missioner.
Wapiti, Cervus canadensis. Improperly called elk and grey moose. This is an American form, probably lawing no representative in any other part of the world. The name elk should never be applied to him, as it belongs to another succies. another species.

Deer, Cervus virginianus.

Also called Virginia deer,

another species.

Deer, Cerrus virginianus. Also called Virginia deer, red deer and American red deer.

Caribon, Cerrus tarandus. Also called woodland carabon, woodland reindeer and reindeer.

Grouse Genets.—Grouse, or pinuated grouse, Tetruo cupido. Also called pratirie chicken and pracife hen.

Ruffed grouse, Tetrao undefits, Improperly called partridge, and pheasant. As this time burd is neither a partridge nor a pheasant, but a grouse, he should be respectfully addressed by his own name.

Spruce grouse, Tetruo canadensis. Synonyms: Canada grouse, spotted grouse, black grouse, and Canada partridge and spruce partridge. As it is not a partridge, of course these last two names will not be applied to this bird by any intelligent person.

Sharp-tailed grouse, Tetrao pediocectes. Sometimes called prairie hen or chicken, or sharp-tailed partridge.

Colin Genus.—Colin, or Virginia colin, Orlga virginianus. Synonyms: Quail, partridge, Vieginia quait, Virginia partridge, Maryland quail, or partridge, and Bon Whito.

These synonyms are all inappropriate, or belong to

ginia partruge, sanyama propriate, or belong to other birds, except the last, and should not be applied to this excellent and useful species of game. Bob White is not inappropriate, and has been used considerably of late by some enthusiastic name-makers, but we like the name not inappropriate, and has been used considerably of late by some enthusiastic name-makers, but we like the name colin best. It is euphonious, easily spoken and written, and has the merit of age and the claim of priority. Webster defines colin, the American partiales, Perdar regiminants or Ortga virginianus, and gives Baird as authority, "Chamber's Encyclopedia" says, "Colin-see Virginia quail," On turning to that page, we find Virginia quail,

or calm (Ortyx), a genus of birds of the family Tetro-anidae, closely allied to the quails and partridges, but differing from both. * * * The best known species is the Virginia colin (O. virginianus), etc. Why this old and appropriate name has been dropped is an enigms, but the propriety of reviving its use is clear.

but the propriety of reviving its use is clear.

Crows,—Washington, D. C., Feb. 21st.—I read with much interest the article on "Ravens and Crows," by Mr. Buckley, in Fourest AND Stracta of this week, as I do all your articles on subjects of natural history, and was reminded of some traits of Corrus americans in this section of the country. Vast number of crows may be seen morning and evening flying over Washington, on their journey to and from Chesapeake Bay and the pineries of Virginia, where they roost. Dead fish, defunct quadrupeds and a thousand and one delectable reminiscences of Baltimore sewers, cast up from the deep, are the attractions. What I wanted particularly to mention, however, is the fact that in the early spring these ugly birds have a bad habit of finding unprotected lambs on the loosely managed farms in Maryland and Virginia, and pecking the eyes out of them. In this matter the crows are great epicures. An experienced occulist could hardly remove an eye with more case and facility than these merciless crows. They are also death on young chickens, and are as bad as hawks on the prairies in finding and destroying new broods. In some of the pineries large quantities of guano are obtained and used in fertilizing the thin soil of these States, which is about all the benefit the crows are, and that is small recompense for the damage they inflict.

J. C. B.

OTTERS UNDER THE ICE.—Houllon, Me., Feb. 14th.—
My experience coincides with that of "Fred.," as stated
in the last issue of FORIST AND STREAM, and I will add
further, that it takes a smart hunter to run down one of
these animals swimming under the ice. Otter, mink,
and muskrats are taken by spearing through the firstformed ice when clear and thin, just strong enough to
hold a man while in rapid to The hunter strikes
hered is, so even in the content of the content formed fee when clear and thin, has strong enough the hold a man while in rapid motion. The burnter strikes them as they rise to breathe. The breath is oxygenized by contact with the water almost as soon as expelled, but when hard pressed more or less is wasted and the quarry soon weakens for want of it.

WHAT MARTIN LCTHER THOUGHT OF THE SPARROW.— Chicago, III.—A large tree in front of my library windows is the perch nearly all day of innumerable sparrows, to my cheerful entertainment, and an alloy at the side of my house is their principal feeding ground, where I ob-cerred their food is gray.

my noise is their principal rectang ground, which perver their food is grain.

Yet I remember picking up, some five or six months ago, a helpless callow bird, unmistakably sparrow, with a fresh angle worm in its bill. Is it yet settled what is their chief food? and has the sparrow war ceased, or only

subsided for a time?

subsided for a time?

Among the miscellanies of Luther's "Table Talk" (Bohn's edition, page 368), are the following lines, which I cite for the benefit of Mr. Coues, to show the opinion that Luther had of them three and a half centuries ago:

—"The sparrow is a most voracious animal and does great harm to the crops. The Hebrews call it tschirp. It should be destroyed whenever found."

T. D. L.

Hish Culture.

FISH CULTURE IN MASSACHUSETTS.

THE Massachusetts Commissioners are from year to year perfecting the system of fishways in the various rivers of the State, and in this way providing free passage for the fish to and from their spawning grounds. The large fishway built at East Taunton, over what is known as Squaw Betty Dam, has given general satisfaction, and the conflict which has existed for half a century between the mill-owners and the fishermen has finally been settled, or at least transferred to other battle fields. The inspection of the passage of fishes up the Lawrence fishway was continued through the year from May 5th to Nov. 1st, and a record kept of two observations daily. The number of salmon thus noted was twenty-eight, the other fish being alewives, suckers, chubs, bass, shad and eels.

Serious depredations were committed at the South Hadley fishway. Thousands of fish were taken from it, and the services of a Superintendent were found necessary here to protect the State's interests. The efforts to obtain shad spawn here were rendered futile by the exorbitant prices insisted upon by the owners of the seining pounds there, and the Commissioners of both Massachusetts and Connecticut felt warranted in resisting their demands even with the loss of the spawn. It is suggested that another pound might be provided lower down the stream, where the Commissioners would be independent of the private establishments.

The breeding of trout, though not strictly within the province of the Commissioners' work, has been prosecuted to utilize the breeders acquired by the State in the lease of the hatching ponds at Plymouth, N. H.; over 100,000 spawn have here been produced, of which one-fourth belong to Massachusetts, and it is proposed to distribute these to parties who will keep a record and furnish statistics regarding them. They will be ready for delivery in April.

Massachusetts received as her share of the land-locked salmon (Salmo schego) from the works at Grand Lake shad spawn here were rendered futile by the exorbitant

Massachusetts received as her share of the land-locked salmon (Salmo schago) from the works at Grand Lake Stream, Maine—240,000 eggs—of which 224,763 were successfully hatched and the hy distributed to some twenty-eight ponds throughout the State.

The returns from most of those who received these fish are sufficiently encouraging to warrant a further distribution of them. All parties must make application in writing, giving a careful description of the poud in which they desire to place them. The plan is to furnish them at the State halching-house in Winchester, free of charge, to all applicants having under their control any of the

great ponds of the State. For transportation, parties should bring with them good clean half-barrels or milk-cans, holding ten or twelve gallons, a thermometer, and a dipper for acrating the water. The half-barrels will carry from 4,000 to 5,000, and the milk-cans about 3,000. The introduction of these fish into ponds having neither in-let nor outlet will for the present be discontinued. There will probably be about 200,000 for distribution next spring. No orders will be received after the 20th of April.

April'
None of the spawn of the California salmon, although freely offered by the United States Commissioners to the States, has been accepted by any of the New England Commissioners this year.
There seems to have been a general feeling, without preconcerted action, that it was best not to incur any further expense in trying to introduce them in our waters until something more was known about them. The oftrepeated assertion that these fish all die after spawning has been pretty thoroughly exploded. But although rapid repeated assertion that these fish all die after spawning has been pretty thoroughly exploded. But although rapid in their growth, and apparently very healthy, they have, from some unknown cause, failed to report themselves. Of the hundreds of thousands that have been put into our rivers, not one adult fish has been seen or taken, and, so far as we know, not a single smolt has been eaught in any of our streams. It is to be hoped that the cause of this apparent failure will be discovered, and that the energetic and praiseworthy efforts of the United States Commissioner to introduce them into Eastern waters will yet be successful. yet be successful.

yet be successful.

There was an increased run of salmon in the Merrimack the past season over that of the precoding one. They cane in schools during the month of June; but very few made their appearance after that month. During the greater part of June there was scarcely a day that they were not seen either in the fishway or around the mouth of the same part of June there was scarcely and the mouth of the same part of June there was scarcely a day that they were not seen either in the fishway or around the mouth of the same part of the same pa

Another noticeable fact was that some of the fish were

of it.

Another noticeable fact was that some of the fish were unusually large for this river: one which passed the nets at Plymouth during a heavy rise of water was killed in attempting to scale Livermore Falls. It weighed over 23 pounds. Doubtless it was of the first year's plant.

The season has been an unfortunate one for securing these fish for breeding purposes. Either the water would be so high that the nets could not be maintained, or so low that the salmon were deterred from making any effort to reach their breeding-grounds. A few hours' rain in the mountains will raise the river at Plymouth very rapidly from four to six feet. During the low stage of water many salmon could be seen in deep pools below Plymouth. At New Hampton, late in the season, no less than eight large ones were seen in one pool. The drought has been severe this fall, and it is probable that many salmon have spawned in the rapids below Livermore Falls, instead of going above, as they otherwise would have done. would have done

would have done.

The exact number of young salmon deposited alive in the river in 1875 is not known. They were intrusted to the care of Mr. Waddleigh, then Commissioner of New Hampshire, whose inexperience caused considerable loss; and in one instance the lish were disposed of in a direction not contemplated by the Commissioners of this State. These things have had their effect in lessening the number of adult fish taken at the hatching-house. The planting of 1876, under the care of John McNeil, was by far the largest and probably the most successful effort that has been made in any one year toward restocking the river.

largest and probably the most successful effort that has been made in any one year toward re-stocking the river. The result of this planting will be due the coming season. A good nany salmon have been taken along the coast in pounds, weirs, and gill-nets. One man near Nowbury-port took twelve, and many were taken along the coast ford, and sold in that market. Yet, of all the statements received from the fishermen giving the number of edible fish taken by them, only two report any salmon. There were many parrs and smolts found in the Penispewassett the past summer, which must have come from spawn naturally deposited by the salmon that reached the head waters during the last two years.

Below will be found extracts from the report of Mr. A. H. Powers, Commissioner of New Hampshine, and superintendent of the hatching-house, in the joint interest of the two States:—

the two States

"The 267,500 California salmon mentioned in my re-

the two States:—

"The 367,590 California salmon mentioned in my report one year ago were distributed in the menth of January as follows: 25,000 were put in the Contocook River, 28,000 in the Salmon Falls River, and the remainder in the Pemigewasset. At any time till the last of August these salmon (parrs) could be seen in large numbers anywhere in the river near the hatching-house, from three to five inches long, very lively, and apparently healthy.

"From our breeding trout 160,000 eggs have been taken. Twenty-two Atlantic salmon have been taken this scason, weighing from eight to twenty pounds each. The first was caught June 13th, and the last Oct. 29th. All were caught at night, or before 6.30 a.M. Thirteen were females, and from them we have secured over 100,000 eggs. For over thirty years not a salmon passed up the Teamigewasset. This is the first time, in this country at least, that any considerable quantity of eggs has been taken from mature salmon caught from a depleted river artificially re-stocked. The result cannot fail to be highly gratifying to those who have, or have had, the matter in charge, and has, to a certainty, demonstrated that the faith of the few, who argued that the rivers could be re-stocked to advantage, was well founded. Those who have believed it impossible must now be convinced that it is not only possible, but quite practicable."

ticable."

That the California salmon, put into this river in 1878, survived the winter and summer up to the last of Λ ugust, making a much more rapid growth than the Λ tlantic salmon, is certain; but whether they will be found next summer as smolts, or whether their sudden departure last summer was final, remains to be seen. Of the large number that have been turned into the Merrimack during the last five average it, which any

ber that have been turned into the Merrimack curing the last five years, this is the only instance in which any trace of them has been detected so late in the season. The Bucksport establishment for taking Penobsot saluon spawn was reopened this season, and the money therefore used to pay for the transportation and expenses of California salmon was used to secure spawn two this whose payers.

The 100,000 eggs taken at Plymouth, with what may be obtained from Bucksport, together with the natural deposit in the river, will make a fair planting for the coming season,

The State of New Hampshire has passed a law extending the time for taking salmon to 1882, in order to carry out what has been so successfully begun; a similar law should be passed by Massachusetts.

"SETH PERKINS" HYDRIDS.—Ells Lick, Somerset Co., Pa., Feb. 16th.—Editor Forest and Stream:—Mr. Seth Perkins, in the last issue, says he has crossed the catfish with the "muscle." Will he please give us the details? He is respectfully requested to stand up in meeting and tell what he knows about the matter.

The number of animaleulæ in a single drop of water is

past finding out, but it has been estimated by careful students that this host of living creatures is doubled and trebled when the drop of water is dyed with pigment and flows from the tip of an ordinary Gillott pen. Let our correspondent first read and comprehend the facts detailed in the paper published elsewhere with the title 'New Discoveries in Natural History." Then he may be prepared for the next stop in the mysteries of ink-bottle fish culture.

fish currure.

White Fish for Lake Ontario.—Rochester, Feb.

2th—I think there will be an effort made to stock Lake
Ontario with white fish, and any parties knowing where
they are taken in large numbers during their spawning
season, will confer a favor by letting me know by letter.

Seth Green.

CAME AND FISH DIRECTORY.

In sending reports for the Forest and Stream Directory of In secting riposes to the correspondents are requested to give the following particulars, with such other information at they may deem of value; State, Town, County; means of access. Hotel and other accommodations; Game and its Season; Fish and Sesson; Bosts, Guides, etc.: Name of person to address.

Dr. Rollin's Tent.—The dimensions of the segments of the tent described in our issue of Feb. 18th, are: 10 centimeters wide at top; 94 centimeters wide at bottom and 240 centimeters in length.

CONNECTICUT.—A land-locked salmon weighing four pounds has been taken from Simpsic pond, Rockville, this winter.

MICHIGAN—Alpena, Feb. 2d.—Long Lake is six miles from Alpena, which is situated on Thunder Bay. Lake Huron. Reached by daily boats in summer from Bay City, four boats per week from Detroit. Long Lake is a beautiful sheet of water nine miles long by one and one-laif miles wide; plenty of black bass, perch and pike and partridges. Over 1.500 deer killed in this county last season; good accommodation at Long Lake House; charges reason-

able.

As the February sun casts bolder and yet bolder glances over our shoulders; as he climbs the southern heavens, and the springtime crow begins to examine the half-naked fields with critical eye and noisy cawing, the fisnerman's blood gurgles in his veins with freshened vigor, and rods, lines, flies and creel are taken from the shelf and overhauled with a business-like air which discounts the weeks that yet intervene between the mud and slush of to-day and the rustling leaves and purling riffles of June, and while the time yet serves and a decision is still to be made as to "where shall we go this year," let me call the attention of my brethren of rod and reel to what this location can offer.

We have here a summer city delightful beyond comparison, a temperature of from 60 deg. to 78 deg. Far.; the grand Ontario before it, the blue Chonagnen in its midst, and as charming a country upon either hand as

We have here a summer city dengintun beyond comparison, a temperature of from 60 deg, to 78 deg. Far.; the grand Ontario before it, the blue Chonagnen in its midst, and as charming a country upon either hand as the Indians ever gazed upon. From our breakwater and piers in season we take pike, eiscose, bass and shad, all with the fly, and all to be caught within thirty minutes walk of any of our hotels. Our niver, now civilized under the name of the Oswego, swarms with black bass, pike and shad, and for several miles above the city it is wide and shallow, with numerous rifts and falls, rendering it a paradise for the fly caster.

Within a dozen miles we number as many good trout brooks and ponds, and from this point one may with equal ease go down the St. Lawrence, up to the Fulls, or into the Adirondacks. Our air is clear and bracing, our nights cool, our scenery beautiful, our citizens friendly and hospitable. Fine accommodations may be had at any of our hotels at reasonable rates, and the expenses of the fisherman in his journeyings, either upon lake, river, or into the country, are ridiculously small. A boat with oarsman can be had at any time for twenty-five cents per hour or two dollars per day, and board and camping, the opportunities for which are many, will not exceed one dollar a day.

From New York, Oswego may be reached by the O. & W. R., the N. Y. C. and D. L. and W., via Rome or Syracuse; from the west by the N. Y. C., the S. C., and the L. O. S.; from the east by the R. W. & O., and by water from Oglensburg, Charlotte or any of the upper lake ports, by a daily line of propellers. The expense from Mew York is seven dollars, and proportionate rates from other points.

We ratee the finest strawberries in the month of July of any State in the Union, and our black bass are then the most gamy. With a welcome for all, I remain,

AMERICAN FISHING TACKLE ABROAD.—Messrs, Conroy, Bisset & Malleson, of this city have had the honor of being selected by Prof. Baird, U.S. Commissioner Fish and Fisheries, to furnish a complete exhibit of American fishing tackle and anglers' equipments, to represent American progress in the manufacture of rods, reels, lines, etc., at the International Exhibition at Berlin next April. Already many of the English anglers are recognizing the fine qualities of the split bamboo fly-rods made in this country, and in the coming Exhibition the European anglers will have the opportunity of seeing the results of American skilled labor in the manufacture of fishing tackle. This firm will not only supply all the different styles of rods, including sulmon, griles, tront, black and striped bass, split bamboo and wooden rods, reels, lines, flies and fly rods, and the many odds and ends comprised in an angler's outlit, but also the different styles of valling books, stockings, pants, etc., portable kits, stoves, boats, fishing cars and fishing suits of every material, making a most interesting and complete exhibit.

SALMON AS "MARKS OF MOUTH,"-The following novel method of determining the age of certain Indians is given by a writer in the English magazine Good Words, and the locality referred to the Skeena, on the Canadian Pacific Coast. This does not exactly make one's mouth water, but its grating is as effectively chilling as the filing of a saw :

water, but its grating is as effectively chilling as the filing of a saw:—

Near almost overy village we found men engaged in fishing, for, as we passed here about the middle of June, the first run of salmon had already commenced, and salmon is the staple, almost the exclusive, article of food among these Indians. When the salmon fails, as it has sometimes done, the distress and destitution are very great, for the natives seldom raise any kind of vegetables, the character of the country, as well as of the people, being adverse to agriculture. When, however, the salmon can be taken in their ordinary abundance, a man may in less than a month lay in his supply of food for the year. The salmon are cured, after being cleaned, simply by being dried in the sun; and, as the curing-ground is usually near the beach, quantities of sand are blown over the fish. One result of this is that the teeth of the Indians are gradually ground down by the sand which has been incorporated with their food, so that you can approximately tell the age of an Indian by "mark of mouth," the teeth of the poung being but slightly affected, while those of the aged have, in most cases, been worn down to the gums. The dried salmon are stored in a cache, a large box or casing made of rough-lewn cedar boards, and usually built around a tree at some distance from the ground. No Indian will interfere with another man's salmon-cache; it is as safe as if it were guarded by a regiment.

"FLY" FISHING.—Once Sir Humphrey Davy was discovered by some friends, sitting on a stile, rod in hand, and lashing the air with his fishing line. At the approach of his friends he entreated them to stay back while he continued his aerial sport. Their patience exhausted, they went up to him and were saluted with the exclamation; "Was there ever anything more provoking? If you had only remained quiet another minute I should have caught him; it is most vexatious." On being asked to explain, he added: "I have been amusing myself watching the feeding habits of the dragon-fly; he snaps up the midget voraciously; so I baited my hook with one, and had good sport trying to hook him, and if you had kept back a little longer I am sure I would have got him,"—Temple Bar.

THE FLY AND TROUT.

Eagle's Nest, Stamford, N. Y

EAGLE'S NEST, Stampford, N. Y.

Editor Forest and Stream.—An experience of over forty years in all the trout waters of the United States, Territories, and much of British America, using the fly wherever it was practicable, has taught me that to strike with the flash of the trout from the water is the surest way to hook him. I am confident my old friend George Dawson—better fisherman does not exist—will say the same thing.

Later.—'One word,' or a dozen or two, more about fly-fishing. I should, in my previous note on the subject, have said—that "hardly ever" did I miss a trout if I struck on its flash from the water. One cannot be too quick—except in a rain shower. Last summer I had whipped a magnificent pool in the Beaverkill with almost every change of fly I had, fit for the season, but every cast was in vain—the pool was full of lazy-trout, from a pound weight down, that wouldn't even look at temptation. A boom—not a political one, or I should not have been there—a boom of thunder announcing one of the sudden showers peculiar to that wilderness section, caused me to look for shelter. I found it under a big shelving rock which overhung the side of the pool, and just then along came Egbert Tripp, a native on the stream. "Colonel," said he, "put a couple of black ants on your leader and you'll see fun as soon as the rain begins to fail." I saw that he was fixed for the "fun," and laying aside my old leader, I put on one of the Orvis mist-colored, and put on two of my smallest black flies. In a few seconds a heavy shower fairly made the water boil, and in I dropped my black ants. They had hardly trout as there were in the pool, and for the next fifteen or twenty minutes I did nothing but drop in and pull out. There was no tail play in the work there. I filled my fifteen-pound basket without leaving the spot, and Egbert was as busy as I. Now how do you suppose that native, born and brought up on those waters, accounted for this? He said that in a shower thous and so black ants are swept from overlanging trees, dea

The theory is advanced that trout which have been caught with rod and line and then used as breeders manifest a knowledge and fear of the rod, while their progeny in the same ponds are undisturbed by the same rod. This is an indigenous American idea; but to English genius belongs the bonor of having introduced the telephone into deep water and actually listening to the conversation of the monsters of the deep.

NEW DISCOVERIES IN NATURAL, HISTORY,

Editor Forest and Stream :-

Great competition was entered into by your correspondents some time ago to secure the big fish-hook. I don't want to lic under the imputation of wishing to get your hook, nor re-lie, as I fear too many competitors frequently do, upon mythical subjects in order to obtain a big vulgar" fish-hook." "Cod-hook" no doubt it would

frequently do, upon mythical subjects in order to obtain a big yulgar" ifish-hook." "Cod-infying the heaps of communications sent in. My ideas are more of the upward migratory tendency, soaring above those lower orders of fishes while appear to be the principal standard for the genius of your "fish swallowing fish" fraternity. Mine will be the nobiler fish, the lordly sation, as the text for the tale to be told. Nor would I be satisfied with the vulgar cod or catifish hook so eagerly sought for, but should demand for a prize the more genteel and aristocratic "Lady Mutron," "Jock Scott," or "Silver Doctor." But to the point. In seeking knowledge the perfect ordinations of nature are apparent in everything; and difficulties which appear quite insurmountable are frequently overcome by the simplest agencies.

No doubt many of your readers will have either visited or read of the famous Canadian salmon rivers of the Gaspe Basin in the Gulf of St. Lawrence. The Dartmouth has, or had some few years ago, about twelve mouth has, or had some few years ago, about twelve mouth the session of the season of the season of the season of the famous Canadian salmon rivers of the Gaspe Basin in the Gulf of St. Lawrence. The Dartmouth has, or had some few years ago, about twelve mouth the season of the season of the season of the season of the famous the propendicularly over a ledge of rocks about eighteen feet in height. Below this fall is a very deep hole, in anglers' phrase, a salmon pool. Here these fish congregate after ascending from tho sea, waiting if perchance an opportunity would be afforded them for a further migration upwards in search of spawning grounds; and it has been of great interest for the writer to watch the numberless yet ineffectual efforts made by the salmon to surnount the fall. Yet strange to say, salmon were frequently found above this perfect barrier, which sorely puzzled the minds of fishermen and others how this perfect barrier, which sorely but a sea of the season, after casting the rod the season, af

one's wits to work for theorizing and for obtaining know-ledge.

Our ideas ran thus:—Two beavers going over the falls; salmon leaping after them; a big cock-salmen hooked on to a beaver's tail; none but male salmon found above the falls. Putting all these circumstances together, the exclamation arose—"By hookey, I've got the solution," and here it is: It is well known how intensely strong the migratory instinct of salmon is to overcome rapids and falls, inducing them to try every possible means to accomplish it, generally following some prominent leader who, if he proves successful, is immediately followed by the others. This old dead pioneer salmon no doubt had made many trials to get over the falls, and noticing the beaver leading the way, thought best to play the "old soldier" by catching him by the caudal organ, when the salmon's hook-bill perforated the beaver's toigh leathery tail, in which it became clinched as it were, and could not be extricated. A tussle then commenced, no doubt, for the mastery, and in the struggle both rolled into the pool below, where the salmon came to his untilmely end; the beaver becoming exhausted and hungry sought the dangling bait on the "Jock Scott," and he, too, came to grief. Hence this wonderful discov-

ery in natural history, which may yet be utilized to supersede the construction of artificial salmon ladders, our-tailing their expense by using well trained dogs to help migratory fishes over otherwise impassible barriers on rivers.

The shades of night setting in, the camp, a short distance below, was sought. Coffin, the guide, was a dishelicer at first of the whole proceeding when related to him, but being of an inquiring mind and not being willing to be outdone in fishing lore on his native river, disappeared next morning before daylight; returning late for breakfast he was questioned about his absence. He replied; "Sir. I couldn't sleep all night with that 'beaver sadmon' before my eyes, and I felt like taking a hand in myself, and I have succeeded. Now, Mr. W.—, I'll give in that you are a more scientific man than I be in a thinkin' and in a-cogitatin' out how them big he-salmon gets over the falls. but I'm a more practical man than you be, for I see'd a big chain of beavers and sulmon this morning fifty feet long all taggie-hooked together, heads and tails, sloping right over the top of the falls full lick.

This full corroboration of the circumstance by the more "practical" man will no doubt satisfy you, Mr. Editor, and your many readers that two very important discoveries in natural history have been brought to light in this narrative, both of which have puzzled the brains of the most astute ichthylogists and fishermen to explain, namely:—How the Salmo salar and their descendants are sometimes found in waters which it was held to be impossible for them to reach by their own agency; and the still more knotty question of "the use for the cartilaginous excrescence," or "bony hook," found on the lower jaw of the male salmon during the spawning season.

P. S.—As no scaly "hybrids" (à la Seth Green) were ever found in the river from the co-habitation of the

P. S.—As no scaly "hybrids" (à la Seth Green) were P. S.—As no scaly "hybrids" (à la Seth Green) were ever found in the river from the co-habitation of the beavers and the male salmon, the Canadian Govern-ment, in its wisdom, caused several charges of dynamite to be applied to the ledges forming this cataract, which tore away large masses of the rock, so that male and female salmon and their legitimate progeny are now found in large numbers scores of miles above the Dartmouth Falls.

The Honnel.

THE following lines were composed by a young lady who, after returning from the city, where she had been visiting some friends, had received a photograph of a gentlemant's dog. She had become very much attached to the dog, and before taking leave of him must needs take with hera "bock of his hair," reference to which is made in her letter addressed to doggy, whose mane is Max. The esteemed epistle is worthy of a wader appreciation than that of Max's circle of acquaintances, and we have been permitted to publish it here: -

MARSHLANDS, Feb. 6th, 1880

DEAR MAXIE : DEAR MAXIE:—
I trust vou'll not think it a crime
If in sending my thanks I inclose them in rhyme;
Between reason and rhyme I scarcely could choose,
So greatly your picture awakened the muse.
I cannot express my delight and surprise On seeing once more your darling brown eyes It is you to the life, from your neat spotted ho To the shiring cold tip of your innocent nose—And the eloquent words of a Burke would fail In describing the dignified curl of your tail. But Maxie, old boy, where's the genial smile With which so often your friends you'd begulle Into giving you many a bone or bit, sit? Or on the sofa, unchidden, letting you sit? Were you thinking so gravely, Max, of the past? Or, "banish the thought," was it but the repast? I'm sure you'll not make so ignoble confes I'm sure you it not make so ignoble confession,
Tis only, you'd say, my "Sirlus expression,"
I ever shall cherish, with the fondest of cure,
Your image and the lock of your honnie brown hair
Though another the wit of the house may brag,
Long, long dear Max, may you be the wag. Sincerely your friend.

THE NEW YORK DOG SHOW.

HE Fourth Annual Bench Show of Dogs, to be held under the auspices of the Westminster Kennel Club, at Madison Square Garden, this city, Tuesday, Wednesday and Thursday, April 27th, 28th and 29th, will provide for seventy-four classes, with the following list of premiums, in addition to which a silver medal will be awarded to the third best in all classes where two money prizes are given :-

prizes are given:—

Class 1.—Mastiffs—dogs, first, \$20; second, \$10. Class 2.—Mastiffs—bitches, the same. Class 3.—Puppies—dogs and bitches, \$10; silver medal to second. Class 4.—Rough-coated St. Bernards—dogs, \$20 and \$10. Class 5.—Bitches, the same. Class 6.—Smooth-coated St. Bernards—dogs, \$20 and \$10. Class 7.—Bitches, the same. Class 8.—St. Bernards—puppies, \$10; silver medal to second. Class 9.—Normal class 10.—Puppies, silver medal. Class 11.—Siberian or Ulm—dog or bitch, \$15; silver medal. Class 12.—Greybounds—dog or bitch, \$15; silver medal. Class 13.—Deerhounds—dog or bitch, \$15; silver medal. Class 13.—Deerhounds—dog or bitch, \$15; silver medal.

silver medal. Class 12.—Greyhounds—dog or bitch, \$15; silver medal. Class 13.—Deerhounds—dog or bitch, \$15; silver medal. Class 14.—Champion Pointers, over 55 lbs.—dogs, \$35; Class 15.—Over 50 lbs.—bitches, \$35. Class 16.—Pointers, over 55 lbs.—dogs, \$30 and \$20. Class 17.—Over 50 lbs.—bitches, \$30 class 18.—Chumpion Pointers, under 55 lbs.—dogs, \$45. Class 19.—Under 50 lbs.—bitches, \$35. Class 20.—Pointers, under 55 lbs.—dogs, \$30 and \$20. Class 21.—Under 50 lbs.—bitches, \$35. Class 20.—Pointers, under 55 lbs.—dogs, \$30 and \$20. Class 21.—Under 50 lbs.—bitches, \$30 and \$20. Class 22.—Pointer puppies—dogs, \$40 silver medal. Class 23.—Bitches, \$40; silver medal. Class 24.—Champion English Setters—dogs, \$55. Class 25.—Bitches, \$35. Class 26.—Imported English Setters—dogs, \$30 and \$20. Class 28.—Native English Setters—dogs, \$30 and \$20. Class 28.—Native English Setters—dogs, \$30 and \$20. Class 28.—Bitches, \$30 and \$20. Class 29.—Bitches, \$30 and \$20. Class 20.—Bitches, \$30 and \$30. Class 20.—Bitches, \$30 and \$

The entries closed April 12th. Catalogue of classification and prizes, with rules and regulations and entry blanks, may be obtained of the Superintendent, Mr. Chavles Lincoln, whose office is at 111 Fulton street, i., over Mouquin's Restaurant.

The number of entries already received is largely in excess of any of the entries formerly received at such an early date; and this, with other indications, leads the management to anticipate a very large show.

Mr. M. P. McKeon's Cocker Spaniels.-In a late number we made brief mention of the excellence of Mr. McKoon's stock, and at the same time noticed that we had received for our album, ten card photographs of his little cockers, taken by Mr. John T. Walters, a neighbor of the proprietor of the Blue Star Kennels. The reputation of Mr. McKoon's fine collection of handsome and healthy does is so well established in this country that further remark as to their beauty is unnecessary, but before noticing the distinguishing features of cockers, we wish to call attention to the fact that experience has shown Mr. McKeon's dogs to be superb workers, as in almost every case they have turned out well. It is an astonishing thing that cockers are not more generally used in this country. particularly in sections where the underbrush is so dense and intertwined that full-sized setters or pointers cannot force their way. Take Montauk, for instance, where woodcock at times are plenty in the scrubbrush thickets that help to fill up the hollows between the hills. One little cocker would move more birds than a dozen setters and all King Pharaoh's descendants put together. Unlike the pointer or setter, the spaniel always works with his nose to the ground, and does not carry his head in the air feeling for a body scent. Thus, this peculiarity places him at an advantage over other keen-nosed dog in covers where the air has but little chance to circulate. Experienced trainers tell us that kindness is quite out of the pale of possibility in breaking the spaniel, and that nothing will do but severity; we do not agree to this. Let the puppy be eight months old, handled with a twenty-yard cord, and then introduced among three or four broken dogs, and the task of breaking is a compara-tively easy one. When he has been taught to work at a proper distance-for with spaniels distance is to be inculeated first and principally-then turn to teaching him to "down charge," and work and time will do the rest. It was Herbert who first called the attention of the sporting public to the invaluable qualities possessed by this sprightly, jolly little field companion, whose merry laugh would drive the toper woodcock from his morning julep. The breaks and thickets surrounding Merritt's Island forced the thoughts of the newly-fledged Englishman back to the covers of the British coast and the woodcock's haunts in the Norwegian inland woods and marshes. He saw at once the advantage of the cocker for woodcock shooting in this country. And as far as his theory went Herbert was "dead to rights,"

GEORGIA FOX-HOUNDS.—Americus, Ga., Feb. 15th.—The breed of fox-hounds mentioned by "J.A.C.," in issue of Jan, 29th, is a favorite with us—sensible, fast, reliable and splendid bettom, One thing about them rather peculiar is, the ring never goes entirely around the neck. I am not certain where the original stock came from, but it is said they came from Maryland. The peculiarity of shedding the hair in summer seems to be convenient to the dogs, but it makes them liable to mange un-

less well cared for. We run both fox and wild cats with our dogs, but this breed of dogs is not so good for cat as for fox, because t'ey circle too far.

IN-BREEDING.—Winchester, Mass., Feb. 18th.—You say breeding a bitch to her sire would be injurious. Is not this a mooted question? I have a flock of partridge Cochin fowls, which I have bred in-and-in for six or seven years—it would be hard to beat them. The famous short-horn cattle were obtained by breeding in-and-in, and has not every strain of animals been established in the same way? I know very well what is enid and the theories that are put forth in regard to it, but practically every stracessful breeder owes his success to breeding in and-in.

The leading physiologists and established.

The leading physiologists and scientists of to-day are very unanimous in opinion that in-breeding in the human race, even within bounds permitted by law, is not conducive to either physical, mental, or moral development, but decidedly the reverse. In proportion as we descend in the scale, the ill results are less pronounced, or manifest; chiefly because the various developments of the animal are less pronounced, but the evil still remains; and where inbreeding is recklessly indulged in, soon becomes manifest and very serious. We do not declaim against all inbreeding, but where it can be avoided and still secure the prominent or desirable features of type which we desire to reproduce or develop, it should be done. Thus in-breeding, per se, is an evil, and has been marked by the disapproval of all ages, deteriorating diseases and sterility being the most promment evil results in the human race.

being the most promment evil results in the human race, IMPORTED PUTPLES FOR THE MOSTYLEW KENNEL.—In the FOREST AND STREAM of Feb. 12th, we noticed the arrival of a fine brace of Lavcrack pupples; we are now enabled through the courtesy of Mr. Jos. H. Dew, of Columbia, Tenia, to give the particulars. The pupples, Blue Queen and Blue Princess, were purchased through Mr. George Lowe, Secretary, E. K. C., of Mr. H. F. Grant, of Newport, England, their breeder, They are by Mr. Lowe's dog, Tam O'Shanter, who is by Champion Rock out of champion Run; and out of Mr. Gram's bitch La Reine, who is by Blue Prince out of Cora. These pupples are as pure Laverack as can be found anywhere, and combine fine crosses to old Blue Dash. La Reine is own sister to the field trial winner, Blue Bell Hf. The brace reached Columbia in fair condition after their long rough trip by both water and land.

WESTMINSTER KENNEL CLUB'S NEW KENNEL.—We are informed by Mr. Robt. C. Cornell, Secty, and Tress. of W. K. C., that the club has just taken a lease of sixty acrys of the old bitchfield Farm at Bulylon, L. L. Fossession will be taken by the club as soon as the house and kennels are put in order, which will be in about two

St. Louis Bench Show.—The St. Louis Kennel Club's Bench Show will be held Oct. 5th, 6th, 7th and 8th.

Bred.—Condess Bear-Count Rocket.—The Montview Kennel's Countess Bear to Count Rocket.

Daisy Dean-Count Fred.—The Montview Kennel's Daisy Dean to Count Fred.

Blaze-Lincoln The Montview Kennel's Daisy Dean to Count Fred.

Blaze-Lincoln.—The Montview Kennel's Blaze to

Blaze-Lincotn.—The MonView Renners Dinage to Lincotn.
Daisy II-Sensation.—The Westminster Kennel Club's Daisy II to Sensation, Jan. 23d.
Pullus-Sensation.—The Westminster Kennel Club's imported Pallas to Sensation, Jan. 24th.
Pixic-Grap,—Mr. Robert C. Cornell's fox terrier bitch Pixie to Mr. Howard Mitchell's Grap.
Tenus-Victor.—Mr. Henry B. Skilies' beagle-bitch Venus to Messes. Poundl and Elmore's Victor, Christiana, Lancaster Co., Pa., Feb. 6th.
Psydo-Pank.—Mr. H. N. Munn's Psyche to Mr. Edmund Orgill's Rush.
Firit—Glen.—Mr. E. Francis' (Newark, N. J.,) blacks and tan setter bitch Flirt—Munn's Dink aut of Field's Alec. litter sister to Mullen's Belle and Pryor's Belle—to Dr. Aten's Glen, Jan. 26th.

Alce, litter sister to Mullen's Belle and Fryor's Dence—to Dr. Aten's Glen, Jan. 26th.

Ruby.—Mr. Edmund Orgill has sold his pointer bitch Ruby to Mr. A. H. Moore, of Philadelphia.

Countess Royal-Faust.—Jr. S. B. Dilley's Countess Royal to St. Louis Kennel Club's Faust.

Spot-Bow.—Mr. James Brittain's Spot to St. Louis Ken-

Club's Champion Bow.

Sales,—Count Fred and Dashing Model,—The Montview Kennel, Columbia, Tenn., sold, last week, Count Fred and Dashing Model to Mr. A. H. Moore, of Philadelphia, These dogs were imported in 1850.

Ficeroy,—Mr. W. W. Smith, Ruleigh, North Carolina, has purchased from Mr. Henry W. Livingston, of this city, the lemon and white pointer dog pap Viceroy, whelped November 24th, 1859, by Orgill's champion Rush (Flake-Lillie), out of Livingston's Rose (Shapshot-Gypsy). The notice of sale of Berkley and Duck to Mr. Moore, of Philadelphia, in our last issue, was croneously printed Berkley and Duke.

Kestrick. — The St. Louis Kennel Club's imported pointer-bitch Keswick has whelped one dog and three bitches to Mr. Pilkington's Garnet.

STATE CONSTABLES .-- Commenting upon the inefficiency of the "duck police" of that neighborhood, appointed by local political influence, the Havre Republican, of Havre de Grace, Md., makes a point for the system of having game constables appointed by the Governor. We are pleased to see such an intelligent opinion expressed :-

Deased to see such an intelligent opinion expressed:—
One of the radical defects of the law is the appointment of the duck police by our county commissioners. A bill is about to be presented to the Legislature placing their appointment in the hands of the Governor. The position of duck police is now made a political appointment, and as such is a subject for bargaining and trade. Place the appointing power in the hands of the Governor, and let the guaners unite in recommending gentlemen who they are satisfied will faithfully carry out the law in all its provisions, and the result will be more satisfactor;

Woman's Column.

LETTERS FROM MICHIGAN AND CONNECTICUT,

Bay City., Mich., February, 1880.

Editor Forest and Stream:—

The pleasantly written letter from my friend J. M., which appeared in this column not long since, attracted my attention and recalls many pleasant associations, chief among which was six weeks spent together in Northern Michigan, necompanied, of course, by one of the sterner sex, Mr. M., a Nimrod and an angler of great prowess. The scene of our chief delight was the Jordan and Boyne Rivers, whose cool, bright waters flow into Pine Lake, and from thence, at Charlevoix, into Lake Michigan. The banks of the Jordan, luxuriant with vine, fern and moss, and overhung with oedar, whose dark green is here and there relieved by the lighter shade of tamarack with an occasional beach and maple, together with the sweet wild perfume and deep solitude, broken only by the merry ripple of the swiftly-flowing water and music of the whispering pines, furnishes a retreat, rivaling in primeval beauty the classic shads of more frequented streams and twice-told lore. This, too, is the fit home of the much-sought mountain irout. A jutting moss-grown log, round which the eldying water whirls, and the spreading cedar shades, may be the friendly protection of several lively inhal itants, too wary for the temptation of brown lacked or green dragon.

Arriving at this cool seclusion, our heretofore vigilant

dragon.
Arriving at this cool seclusion, our heretofore vigilant companion declared he would not be bothered by women, and procuring us the services of a trusty guide. Left us to follow our own devices. Often

amprocuring us the services of a tristy guide, left us to follow our own devices. Often

"With gun and rod be'd leave us, Pursuant of his sport."

Nor would we see him again until the hour of noon brought him to the trysting codar tree, where a hunch would be spread, followed by a siesta enhanced by a pillow of fragrant moss—a cool breeze which were failed, and hulled by the weird song of the water-thrush.

Airs, M—being much inclined to rival her husband in the use of the rod, and skill in throwing a three-yard leader, and I quite approving such an ambition, much of our time was spent in fruitless attempts at scientific wrist movements; and it was with praiseworthy patience and skill that our good guide disentanged from tannarach branches and submerged rocks our three-plied leaders. But do not imagine that so much patience could be without its reward, for besides many lesser heauties that graced our boat-well, was a two-pound attraction, so shy and active that it required all Mrs. M.—'s skill and the missiance of a landing-net to induce him to change his quarters.

While pursaine these real evolving mon the river we

and nettive that it required all Mrs. M.—'s skill and the assistance or a landing-net to induce him to change his quarters.

While pursuing these rod exploits upon the river we made our headquarters at Mr. Webster's, whose domicile was the only housefor many miles around. And better comfort could not be found. The house is built of squared timber, piled up in block fashion, reminding one of the legends of their grandfather's tine. The upper story was one large comfortable room, capable of becoming as many as there were blankets to lamp from the beams above, thus making a wall at once sufficient and useful in the way of a pin-cushion, and so forth. And this recalls an incident. Coming in late one afternoon, — and I were in time to witness the arrival of a lady and gentleman from Chiengo. And sinding in the background, thinking dublously of our short gingham gowns and thick boots, beside this explicit hady, we heard her inquire loftilly of Mrs. Webster to he shown immediately to her apartments! Mrs. W. looked abashed, but politely asked her to follow, and ushered the lady into a next little room, whose gray partitions were gently undulating in the summer air. They defined say long. Again we were gliding swiftly and silently down the river, in the soft light of the setting sum. A shadow, then a duck, in quick succession came fifting up the stream. A gentleman in the boat belind us arose, expecting to bay the game, after giving the lady a first chance. A respitable and dead bird, was the result. It was a triumplant moment for her, being among the first of her wing shots.

After four weeks of this delightful sport we betook one-

ots. After four weeks of this delightful sport we betook our After four weeks of this delightful sport we betook ourselves to saling. Our centr, which was too large for the
river, we had left at its mouth. Embarking with sufficient provisions we cruised along the breezy expanse of
Pine Lake, tenting over night beside a patch of berries,
It was our purpose to reach by slow degrees the bend of
the lake where cupties the Boyne River, and there is
small boats to try the islaing. My friends caught
immerous fine trout, while I had an opportunity of there
were the decire an ediscrett duck marsh with but noderate numerous fine trout, while I had an opportunity of thoroughly doing an adjacent duck marsh, with but moderate results. My game was of an undistinguished sort, such as hawk, mink, porcupine, thing isys and squirrels, with a few partridges and pigeons. And here let me say, with due modesty and for the encouragement of my gan-by sisters, that I seldom aimed at anything without feeling confident of success. Of course, my confidence has been frequently shaken, but still holds out, and I love to shoot.

frequently shaken, but still holds out, and I love to shoot.

Among the attractions of this river—which, in my opinion, does not equal the Jordan—was a spring of ice-cold water bubbling from a bed of rocks, and overlang with mossy logs. Lingering here for a few days, we again took to our beat and berry patches, trolling for bass and catching a maskenonge as we went. Never shall I forget the first night we camped. The day had been warm, but breezy, and we flitted from shore to shore, while the water, as it parted from our bow, made a meny monotone accompaniment for the banjo and guitar aboard, and our songs rang out and were celocid back from the wooded shores around us. At length we were induced by the beauty of a certain hillside to tarry for the night in its shadow. And running in under the lee of Horeschoe Island, we came to a stop in the stilly waters and went ashore in small boats—scurrying to the summit of the thij for a look at the surrounding country in the light of the dying day. Slowly descending, we found are guideds had not been idle, as a large pail of red fruit testified.

testified.

The picture still lingers in my mind: The last red glow
of the sun, the pale shimmer of the rising moon upon the
white sails of our little craft anchored upon the placid
water, our bright camp-fire and frugal supper of bread;

berries and barbecued trout on forked sticks; while with Decrees and barbeened front on forked sticks; while with the merry laugh and stories were mingled the sad notes of the whippoorwill's song. And thus was a bright day closed, and night fell over all.

Many more sailing and shooting excursions have been my happy lot in company with genial companions; but of that another time.

F. C. G.

Lakeville, Conn., February, 1880.

LAKEVILLE, Conn., February, 1850.

Editor Forest and Stream:—
I wrote my former communication to you while my husband was off on one of his camping tours, and he saw it first in his paper, after his return. After reading a little he commenced langhing and said it reminded him of old Duke, but he soon recognized its author by the truthful picture portrayed. A friend in the city of N. B. also recognized the facts and said "Rath forgot to tell about the pup losing bis tail;" so I think it appropriate right here. This friend is also a sportsman, and at that timehad more knowledge of dogs than my husband, so he said if he were in his place he would have the cords drawn out of the pup's tail so he would always carry it straight, and that the mode of proceedure was to take the tip of the tail between the tech, then give a sharp bite and twist, and pull at the same time, and the cords would draw out to the roots of the tail, and he also voluntered to do the job. They were in the sitting-room, and thinking to get it done before I knew it, and not thinking it would 'pleed, caught the pup and bit off his tail. Of course he got away as soon as possible and went around the room close to the wall making good time with both tail and leet, then out through the ball, and every jerk of the tail sent a mark of blood on the wall. You may judge of the consternation of those men when they saw what had been done. That dog was the bane of my existence. He would ret cut and be sure to follow me just

the tail sent a mark of blood on the well. You may judge of the consternation of those men when they saw what had been done. That dog was the bane of my existence. He would get cut and be sure to follow me just when I did not want him. I remember his coming after me once when a mile from home and nearly train time. I coaxed and scotled and finally broke my umbrella, and I would go a few feet and stop, till finally I had to let him go with me. I put him in the baggage car and when I reached town I made bin come to heel and took him to my bushands office and left him and the remains of my tunbrella.

I saw one communication which pleased me very much, I think it was signed R. T. S., who says she goes hunting with her husband, but I think if she lived in Connecticut she would soon tire of hunting, as she seems to only but on prairie or open ground. Now I can shoot a gun, but I never tried going out hunting, for my husband is a man nearly six feet tall, and dresses in heavy boots and leggins and a waterproof suit that is heavy; and when I see that all scratched and torn and covered with mud, I feel sure he has seen some briars and swanps. But I can fish, and often go trolling on our lake and have caught some fine has my susband is the hunter.

I can cook the birds after they are shot. Perhaps you would like to know my methods of cooking, so I will tell you some of them. Woodcook are best broiled; quall and snipe are best fried with bacon, till done to a good brown, and grouse are good made in a pie or stuffed with oysters and crackers, but they should be purboiled always, as it takes all the strong taste from them. Of course this is no fancy method of cooking, but I assure you they are good, and I should like some one cles try and see for themselves.

I think I must tell you of some dogs owned once by my husband and a friend. They were setters six monthe.

cood, and I should like some one clse try and see for themselves.

I think I must tell you of some dogs owned once by my husband and a friend. They were setters, six months old, when they came to them, and as they arrived in the evening were shut in the wood-house till morning. They were tired and so did not disturb us till morning, when they managed toget the door open and went on an exploring expedition over the grounds. Seeing some hens by the barn they made a raid on them. They singled out each a hen and went for them, and I never saw hens plucked so quickly before. There was a cloud of feathers, and the dogs were collared and shut up again, but no chickens were raised that summer, and only four were hatched, and those Duchess tossed up and caught till they died the second day after they were out of the shell. The friend being a little more fortunate raised a few, but they all bad a crocked back, and I presume Duke tossed them some, but probably did not commence on them as young. There is one dog in the village which seems to be a general favorate with the people. He belongs to a sportsman and has seen the day when he was hard to beat lunting, but alsa! he is growing old and independent; he goes where he pleases and will go half a mile to beg a drink rather than help himself at the stream close by, He is a great tease and also very affectionate. RUTH.

- W. S. K., Lawrenceville, Ga.-Was the Winchester rifle used in the late war? If so, did it shoot sixteen times? Ans. The Winchester is an improvement on the old Henry, which was used in the late war and carried seventeen shots. The gun did not take the name of Winchester till 1866.

not take the name of Winchester till 1896; Cruttser—Wishes to know from our readers who have had ac-tual experience with Coughtry's collaspsible dingey:—I. Porta-bility and facility of stowage. 2. Carrying capacity. 3. Sca-worthiness. 4. Wear. For yacht ensigns and burgees write to Annin & Co., 99 Fulton street, New York; also for price list.

- F. F., Boston, Mass.—If you do not approve of the sports discussed in the Forest and Stream and to the advancement of which it is devoted, do not read the paper. There are a good many thousand people in the United States who do participate. in out-of-door sport, and ten years from to-day there will be as many thousands more.
- F. AND A. J. C., New London, Conn.-The eyes of gry points: puppy are filled with matter all the time, and his breath is bad. What shall I do for him? Ans. Keep the eyes clean with tepid water, and perhaps use occasionally a little weak falum water. As you say the dog has recovered from the distemper, proper feeding and plenty of exercise will in time correct the bad breath.
- H. W. F., Rutherford, N. J.-Can you give me pedigree of Gordon setter bitch, now in her fourth year? She was sired by Jerome's shot, her dam being Duchess, which I think also belonged to Jerome. Ans. Shot was imported by Mr. Carroll Livington; pedigree unknown. Duchess was imported by a son of Mayor Havemoyer, having been presented to him by Sir John Bright.
- H. B., Hoboken, N. J.—Please inform me what I can give a dog H. B., Hoboken, N. J.—Please inform me what I can give a dog who has the mange, to make his hair grow out. He is perfectly bare on some parts of his body. Ans. Attend to his general health and groom him once a day. No contimented policious are of any avail. Tepid water baths, without soap, with plenty of friction, may be used to advantage. Is there any irritation of the skin? If there is, write again.
- C. W. P. My setter puppy is six (months old; ever since he was three months old, has been troubled with belching. Has a large yard to exercise in and a good warm kennel in which to sleep Mark to exercise and a good wath keeper in which to steep Has been fed on a general diet. Can you suggest a remedy! Ans. The dog will probably outgrow the biccoughing, but you might administer a dose of oil, followed by twenty grains of sub-carbonate of bismuth after each meal.
- S. P. O., Coudersport, Pa.—My spaniel dog has been lame off and on for some line. For the past ten days he has been quite lame, and on examination of his foot 1 found that between his toes it
- and on examination of his foot I found that between his toes if looks red and raw, and is swollen some? Ans. This is probably one of the various forms of mange. Try Glover's Imperial Mange Cure, advertised in another column. Give five drops of Fowler's Solution of Arsenie fiveice a day in food. Continue for some time and write us fully the result of treatment.

 A. J. C., Bridgeport, Coun.—The skeleh, "Spring Time by the Blue Ridge Trout Streams," was substantially the same as two sketches published in the Forest and Stream last November. The mistake arose from a very curious train of circumstances, the author supposing that his original article—the one published last—was lost, and rewriting it from memory. A comparison of the two forms in which it appeared is exceedingly interesting, as showing the working of the author's mind in rewriting a partially begging the working of the author's mind in rewriting a partially
- J. A. C., Howard, Ohio.-1. Is it injurious to allow fox-hounds to J. A. C., Howard, Ohio.—1. Istituiurious to allow fox-hounds to lie on a haymow, preparatory to running? 2. Should they be tied up or allowed the freedom of the building? 3. Should they be thin in telesh, or in tolerable good telesh and solid? 4. What is the best food in preparing for a race? Ans. 1. Hay does not make a good bedding, as it is too dusy for dogst to lie or move upon good elean straw is the best. 2. All dogs should be allowed their freedom, 9. They want to be in good tradinity trin, as is the ease with the tace horse. 4. Ment diet, with plenty of exercise.
- III. Bath. Me. -I send you a piece of Gry, solid, hard spruce with a BB shot, fired from a Scott breech-loader at sixty long paces. It is one of three shot which fired from the oplinder bar rel, strucks No. 6 envelope. With the choiced or left barrel t put seventeen No. 8, shot in the same envelope at forty yards, emput seventeen No.8. snot in the same envelope at forty yards, embedding them the full diameter in the wood. Have winged a kingdisher at eighty yards. The cylinder barrel will pattern 180 No⁸ 8 shet in a 30-linch ring, at forty yards, and the choke barrel 285. How is this for a 12-gauge? Ans. Your gun has excellent penetration, and the pattern given of the choked barrel tip-top; that of the cylinder here, ordinary.
- J. S., Brooklyn, L. I.-1. I have a hound bitch which is expected to whelp on the 10th of March; will it be too cold to have her whelp in yard? Is also continually eating grass. 2. Will a gun 12-gauge, 28 inches, carry the same distance and have like penetration as one

E-gauge, 30 inches, both full choice and made by same maker Ans. I. Certainty; she should be confortably housed. 2. The powder is generally supposed to have expended its full force at 24 inches. Hence a longer chamber is an advantage in adming simply. But as we said last week, we cannot compare the shooting qualities of priors satisfactorily by these data. Two gauss of exactly the same make and dimensions will shoot very differently. F. L. S., Washington, D. C.—My setter, a pure Llewellon bitch, cleven months old, came in hear a few weeks app, and thinking her too young, I decided not to breach her at present; but by accident she was served by a native liver-colored setter of fine field qualities, but with inferior points for beach showing. What bearing if any will this have upon her future prozeny, and how will had the property and how will

qualities, but with interior points for beach showing. What bearing if any will this have upon her future progeny, and how will
it affect her as a broad bitch, supposing hereafter she be served
by dogs of as the breeding as her own? Ans. She is liable in subsequent litters to have pupies resembling the size of the first. If
the dog has the merits attributed to him by you, it will not affect

the dog has the merits attributed to him by you, it will not affect her injuriously as a brood bitch.

J. A., Pepin, Wis.—I. Would like to get some live carp; could you tell me the nearest place were they can be obtained? g.Would you give me the color, height and other points of the King Charles spaniel? 3. Is he a good retriever? Ans. I. Apply to your State Fish Commissioners, of whom the Secretary is Mr. C.L. Valentine, Janesville. 2. The King Charles and Blenheims originally belonged to the group known as cockers, but they are now only used as toy dogs. The color liked at present is black and thin, or black, an and white. The original King Charles were black and white, with long cars and noses. The weight of a full-grown dog should not be under ten pounds. In Forest and Stream of Jan, 23. 1874, there is an article on spaniels, to which we refer you. 3. The King Charles, like any other dog, can be taught to feels and carry, but his long hairs coat is apt to become STREAM Of Jan. 23, 1823, there is an arrivate on spaniels, to which we refer you. 3. The King Charles, like any other dog, can be taught to fetch and enrry, but his long hair; coat is up to become covered with und and wet, which occasions him so much distress that we consider him useliess after an hour or two.

A. R., Cape Girardeau, Mo.—When I want a few hours' pure onJoyment I take down my file of the Forest AND STREAM and

poyment take nown in the following AND STREAM and reveil in Bay pleasant pages, wherein I find no politics nor other party or personal strite to stir up bad feeling. In it all is harmony. I have a fine breech-bader which, after two years of constant use, I do not understand. We are told to use, for common use, three drachms of powder, and when it is so loaded the reuse, three drachms of powder, and when it is so loaded the re-bound is fearful often audising my shoulder so painful that I have to stop for the day, and sometimes will be lanned for soveral days at a time. To remedy this I have of late reduced the charge to two drachms, and as before one ounce No. 5 shot; with this charge I fail to bring down the game; bring showers of feathers, but few fowls. One gunsmith states that the shoulders of the shell chamber are too high, and the rebound is caused by the wals striking against them when they leave the shell; and he pro-poses to dress them down to the height of the brass shell. Ans The trauble is undoubtfully in the shoulders of the chamber The trouble is undoubtedly in the shoulders of the chamber

The trouble is undoubtedly in the shoulders of the chumber. Have them trimmed down; it will greatly improve the shooting of your gun. We have known of many guns being improved by this. You cannot bring the birds down with two drs. powder. Firmon, Staunton, Va.—B. and S. shoot a pigeon match, 21 yards rise. 80 yards boundary, each having 10 birds and entitled to both barrels. S. at the gun winged bis seventh bird with the first barrel, the bird dropping about 20 yards from the trap. B. remarked to S.: "You need not shoot again, I will give you that bird." The bird was retrieved from which the boundary, a few feet from where it fell, and scored to S. B. at the gun fired both purefix at bis night bird, which being struck. It when we wanted feet from where it fell, and scored to 8. Be at the guin fired both barrels at bis minth bird, which being struck lit about 29 yards from trup. S. remarked to B. "I will give you that bird." In attempting to retrieve the bird it rose and thew some distance over the boundary. Referees decided the bird as lost and scored it against B. taking the ground that B. and S. had no say in the mafagainst b, thaning the ground can b, and S, had ho say in the nat-ter. Was the decision a correct one? Ans. Yes, so far as the caetual performance of 'the contestants was concerned. S,'s sev-enth bird should have been severed, because he gathered it within bounds; B,'s ninth bird not severed, because he did not gather it within bounds. But B, gave S, the inter's several bird regardwithin bounds. But II. gaves, and S. in little's severith bird regard-less of its being retrieved, and S. in little manner gave B. Ite lat-ter's ninth bird; kence in getting the score S, should, as a simple point of personal hours, count B.2 a little bird as ideal. The cus-tom in such a case also, where the shooters agree, is to score ne-cordingly; as there was no disagreement here, the referee excondingly; as there was no disagreement here, the referee ex-coeded his authority.

B. Lewiston.—I have a pointer bitch pup, cleven months old

Make wisson.—A wave a pointer often purperson months old which for several months has been alling and very dumpish; poor appetite, cats but little; is exceedingly thin; about every two wocks she has a violent symptom, and lies on her back with feet weeks she has a violent symptom, and lies on her back with feet extended; whines and barks as though in constant path; then she will stretch, lowering her hind-quarters to the floor, fore-quarters well up, in which position she will stand five or ten minutes, when she will reveres, lowering the forward part of her body and elevating the latter part. One of these positions she occupies most of the time for three or four days, when she quiete slown and becomes singsish again. Her first attack was hast fall while we were out grouse shooting. At this time she laid down, whined and barked, and seemed in the most violent pain, reluctant to move, and paid no attention to birds we shot. She is warmly housed, has been fed with scraps from table principally, also scraps of meat cooked with meal; have fed her raw meat some within last two months. She prefers sweet cake, douchnus and sorage of meat cooked with medic and the for her faw heat some within last two months. She profers sweet cake, doughnuts and any kind of sweet food to arything I can give her. Ars. 5 FISH AND GAME IN QUEBEC .- The third annual dinner of the Fish and Game Protection Club of the Province of Quebec was recently held in Quebec, the following members and invited guests being present, Mr. Romeo Stephens presiding and Mr. W. H. Kerr, Q. C., occupy-ing the Vice Chair: Hon. Peter Mitchell, Andrew Robertson, S. B. Foote, Lieut.-Col. J. H. Isaacson, Dr. F. W. Campbell, Jas. Stewart, Euclide Roy, Louis Sutherland, A. N. Shewan, J. H. Stearns, Hugh Beckett, W. S. Walker, J. Try Davies, F. Henshaw, A. Force, E. C. Walker, J. Hy Bavies, F. Hashaw, A. Vete, J. C. Wilson, F. Drummond, James Johnson, Jr., L. R. Ord, G. U. Ahern, Dr. Alloway, F. J. Brady, W. H. Rintoul, J. B. Robertson, A. Webster, Chos. Cassils, Arch. Cassils, Hugh Patton, C. Holland, W. S. McFarlan, A. Davidson Ross, John Robinson, P. E. Normandeau; Mr. Reeves, representative of the Sherbrooke Club; Dr. Mayrand, representative of the St. Andrew's Club; Capt. Kane, Chas. Robinson, G. S. Wilson, Alfred Rudolf, G. H. Matthews, R. A. Alloway, W. Crowthers, etc. The occasion was one of much good feeling and mutual congratulation upon the success of the Society's work. Special and well deserved compli-ments were paid to Mr. Whitcher and his officers for their efficient services in fish culture and protection.

-London has had another six-days' walking match, Boston is threatened with a "female pedestrian" show, and Weston and O'Leary are to go-as-you-please in San Francisco. With these wars and rumors of wars on all sides of her, New York city is certainly to be congratulated upon her immunity and present freedom from this particular form of lunacy. Possibly a few more dog shows at the Madison Square Garden may elevate the sporting tastes of the populace to a higher form of amusement. New Yorkers could well afford to give up these walking matches, and, following the admirable example set them by the Westminster Kennel Club, substitute a series of annual horse and cattle fairs, pigeon shows, yes, and

-The man who brought his pigeon to pot by shooting up the chimney, as detailed elsewhere in the account of a shooting match, performed an unparalled feat in the annals of pigeon shooting, and as he probably devoured his bird, may reasonably lay claim to the discovery of a new species of "chimney swallow."

AN ADMIRABLE SCHEME.

S OME two years ago we described and commended the plan of the Jolly Club, a New England association of men, women and children, who repair each year to one of the beautiful headlands jutting out from the Vermont shore into Lake Champlair. Here the club has a miniature wild-wood village of rough and rustic but comfortable cottages, with the forest aisles for streets and the vast stretch of wood and water for corporation limits. The members leave their homes in various Eastern cities in the spring and gather at this delightful rendezvous for the summer months. Shooting, fishing, boating, archery, croquet, botanizing, sketching, dreaming in the hammock, and a dozen other diversions and amusements. make up the vacation life. The gentlemen come and go as their business demands, while their families remain to gain health and pleasure. We once fell in with a hard-working New York physician, who in mid-summer was hastening here and there among his patients and looking longingly away from the noisome streets of the city to the restful camp of the Jolly Club up in Vermont.

We referred to the club when we wrote of it before as a New England institution, and held it up as "a bright and shining example to be known and imitated of all good people, North, East, South and West, throughout the land." It is with much gratification, then, that we now note the probable adoption of the same plan by some of our friends in Michigan. Granted that the western projectors of the plan never heard of the Jolly Club, it is still on the platform adopted by the Vermont institution that the new club is to be founded. It is then a triumph for the Jolly Club party of American pleasure seekers, and we hail with much satisfaction the growth of such sound and healthful ideas of summer recreation. For the meaning is that men and women are coming to see in the great world of nature, and outside of the town, fit dwelling places for body and soul; and this in turn promises increased participation in the health-giving recreation of the forest and stream.

In his opening address to the members of the Michigan Association, at Bay City, the other day, President Holmes introduced the project of a summer or fall encampment for the members of the Association and their families. The meeting at Bay City, like all the conventions of the Michigan Association, was so wholly devoted to the more serious work demanding attention that there was not opportunity for much sport, nor did the season invite to the field. The proposition therefore was to select a suitable site on the bank of some lake or river, where, in the later summer or fall, tents and lodges might be erected, and where the members of the Association, with their families, might gather for such a time as might be found con-

Such a scheme in its main features is admirable. It proposes, first of all, to gather sportsmen together where they belong—in the field. Save for a business meeting, a convention of sportsmen in town is a manifest anomaly. The practical instruction to be gained, the theories to be advanced and tested, the mutual giving and receiving of instruction in woodcraft and field work, all these things are to be accomplished out-of-doors. Two days of actual field work will accomplish more than two weeks of theorizing in a hall,

Again, the comprehensive plan proposed includes the family. The views of the FOREST AND STREAM on this point are so well known as to require no exposition here. We have set before us as our mission the advancement of field sports in their proper places and a participation in them not as the chief end of man but as conducive to accomplishing that end. We have taught that the man who is engaged in commercial pursuits is a better business man if he exchange for a time his day-books and ledgers for the fly book and tourist's guide, and that the professional man will be most successful in the long run, who breaks away from the routine of his work for a trip into the woods. Some men become so nervous and fidgety and out of sorts that their fellows are glad to miss them for a time while they are battling the black flies up in the Adirondacks. Society ought to ostracize such of its members and send them off to become men again in the wilds. We do not have room for the expansion of our souls in the city. The best natured men in the world are those who come into the FOREST AND STREAM office on their return from a vacation trip after quail or trout. One cannot help breathing in good nature with the ozone of the pine woods; one's jarring spirits must come into tune again in harmony with the strains of the forest trees swept by the night winds, and the metallic music of the woodland rivulets. There is no such soothing melody of man's handicraft as these harmonies of nature's chords. And if this dwelling in tents or sleeping beneath the sky be good for one man, it is good, too, for a score or a hundred, and for old and young, men and women. It is that we may instill into our children something of our own tastes that such schemes as this of a woodland encampment deserve to be put into execution. The plan offers an excellent supplement to the sportsman's regular field

are scores and scores of inland lakes, surrounded by dense forests, where fish and game abound, and will abound for a century to come. The railroad facilities are such that easy access may be had to the chosen camp, and men or families may come or go as they choose,

The plan just in the form proposed by the President of the Michigan Association may, however, prove impracticable. Hail fellows well met, who are the best companions in the the world for a genuine roughing turn, will not stand the ordeal of a family encampment. means quiet enjoyment to one man is an insufferable bore to another. A miscellaneous gathering of sports--admitted to the hospitalities of the grounds on the strength of their sporting proclivities alone-might not prove the congenial company anticipated by the projectors of the scheme. Indeed, the demands of such companionship are exacting in the extreme. To make a success of a woodland camp the membership must be deter-mined by the same rigid rules which obtain in society those who make up the controlling element must have the privilege of excluding uncongenial factors, and for this reason it strikes us the plan of President Holmes may to great advantage be so modified as to provide for a careful selection of the guests.

This is something which time will try. Let the experiment, in some shape or another, be put to the test not only in Michigan, but in every State in the Union. If it has already been introduced and successfully accomplished, let the fact be known through the Forest and STREAM, for the instruction and benefit of others.

NATIVE AND TRANSPLANTED FISH.—Our angling friend, "Dexter," of Albany, commenting upon the gradual disappearance of our strictly indigenous fish, agrees with us that the artificially grown fish lack the pluck and gaminess of their predecessors. He says :-

ness of their predecessors. He says:—

Ten years ago, when first I commenced fishing in the Mohawk River, the black bass, small mouthed, were there in abundance; and noble fellows they were, too—strong, heavy biters and savage, vigorous fighters; their flesh hard, disky and delicious. In a few years they commenced to grow scurce and a fresh supply was added. The past few years we have been catching plenty of them, a trifle under size. When they bite there is not the slightest resemblance to the actions of their predecessors, but just the opposite; they are not as strong fighters when hooked. Neither do I consider them as good earling.

Making all due allowance for the lance of vacce during

Making all due allowance for the lapse of years, during which the fishing of the past, in common with other pleasures, takes on the excellencies of a backward vision, there are very patent reasons why the artificially bred progeny should afford comparatively tame sport. In their natural state the fish are all subject to the law of the sur vival of the fittest. It is then only the strongest, most vigorous, and best fighters that live to take the fly. Give us the dwellers in the swiftly rushing streams, whose months of battling with the turbid waters have developed their full game qualities; they are worthy of a man's best skill; to drive them quivering and palpitating from their watery home is no child's play; they alone are fit objects of costly tackle, railroad fares and long tramps, One lordly monarch of the wild wood pool, lying on the grass while your own heart beats with exultation, will make the beam descend, though there be a dozen liverfed sluggards in the opposite scale.

GOOD QUAIL SHOOTING .- A gentleman who has just returned from Cleveland County, N. C., reports the quail shooting there the best he ever found anywhere. He stopped at King's Mountain, which is on the Piedmont Air Line, thirty-three miles from Charlotte, N. C. The route from New York is to Washington, thence Richmond and Danville Railroad to Charlotte; fare, \$16.50, which includes tickets only. King's Mountain has two hotels, terms moderate. The country is rough and the shooting grounds close at hand. The birds are abundant, bevy after bevy flushed in succession, and large bags Visitors should take their dogs with them, as the rule. the local supply is limited. If this information is not specific enough, a letter may be sent to Capt. Bell, at King's Mountain, who is one of the two sportsmen in the

BURROWING QUAIL.-The same gentleman relates a novel incident which transpired during his stay at King's Mountain. With his companions one morning he was approaching a little ravine, where from appearances he judged there were birds, when sure enough his dog came to a stanch point. Coming up, they found a dead quail a few feet from the dog, which evidently had just been killed by shot, presumably from their own guns, and then mangled by some animal or bird of prey. But this was not the object of the dog's attention; he was pointing to a hole in the ground, a discarded burrow perhaps, some few feet away. Wondering at this, our friend's guide stooped down, put his arm into the hole as far as he could reach, and pulled out a live quail. They took some sticks and dug away the mouth of the hole; the arm was again inserted, and out came another quail; a third bird was added to the novel capture, and then they stopped, not because there were no more quail in that Michigan and Wisconsin and Minnesota are rich in Michigan and Wisconsin and Minnesota are rich in beautiful sites for such enterprises. Within their borders presumption is that the birds, frightened, had taken refuce in this underground retreat: but their ignoble capture, like that of Reynard in his hole, was certainly extraordinary in this country, where we are not accus tomed to run our birds to earth.

Notes .- The table of contents which will hereafter be found upon the first page will materially facilitate reference to current numbers and to the files. This is an improvement which, with the introduction of date lines now at the top of every page, will be appreciated by our

The pot called the kettle black, and it is not an infrequent thing to hear a self-confessed violator of game law sportsmanship and decency enveigh against the professional not-hunter.

Every aggrieved angler owes it to the craft to resist the implication in the current newspaper squib that "it's the amateur fisherman who hires a baul.'

Several months ago we commended the plan of a FOREST AND STREAM scrap-book, and we have since learned of several such books being made. Those who do not preserve their files will find the scrap-book an excellent thing. The amount of matter worthy of preser vation in such form is greater than one would think without trying the plan. One of our correspondents writes of a set of books kept by himself, one devoted to natural history, another to hints and instructions in shooting, another to fish and fishing, etc.

We wish to call especial attention to the advertisement in another column on wild rice. Many of our inland ponds might be made the resort of wild fowl by a judicious distribution of this very nutricious and thrifty It has proved of vast benefit in the West. Chas. Gilchrist is a sportsman of practical experience in the habits and feed of the aquatics and knows whereof he speaks. The rice is very prolific after the first sow ing, and spreads very rapidly. It is also very fine in flavor as a dessert.

The paper on our first page descriptive of the route to Parmachenee Lake and the Rangeley Circuit contains as much information as the average guide-book-and more. too, for the author wrote it to supply just the facts omitted in the hand-books of travel. Prospective Maine tourists may profitably adopt the suggestion to preserve the pages for future reference.

The index to Volume Thirteen will be forthcoming shortly. Its publication has been unavoidably delayed but we trust its usefulness may be in no wise impaired thereby

As the spring is near advancing we are receiving requests for information about fish and game resorts. directory which has been organized at this office is receiving the attention of our friends and has already proved of material assistance. We again remind our cor respondents all over the land that they may render valuable aid in this work by sending in at an early date such details of shooting and fishing resorts as they may be informed of. Postal card reports are amply sufficient. See the notice in another column.

To our correspondent, "Guy Rivers," who some time ago detailed in these columns his luckless adventures during a voyage down the Mississippi, we commend the newspaper accounts of the tour of Capt. Hemphill, now on a honeymoon trip down the Father of Waters. The happy couple have their boat all to themselves-not another soul on board. The craft is decked with flags, streamers and evergreens, and the popular captain is everywhere hailed with steam whistles and cannon.

Sing hey, the gallant captain that you are.

Ruskin will lecture on St. Patrick's Day before the London Institution, and his theme will be: "A Warning to Snakes." He is reported to be a student of snakes What Ruskin has to say about them, whether his lecture be scientific or not, will be well worth listening to.

ACKNOWLEDGMENTS .- It will be remembered that we noted some weeks ago the sad death of Mr. E. B. Staples. of Sarasota, Fla., who had been known for years to our readers as Major Sarasota, and we mentioned at the same time the straitened circumstances of his family. It gives us pleasure to publish this acknowledgment from Mrs. Staples, which is dated at Sarasota, Fla., Feb. 5th :-

I desire to express through your columns my grateful thanks and appreciation for the sympathy and aid which has been extended to me and mine in our hour of great desolation and destitution. On the 15th of November desolation and destitution. On the 15th of November I received from your corporation twenty-five dollars; Thanksgiving day, from Capt. Silas Stearns, appointed by the Smithsonian Institute, a magnificent supply of groceries and ten dollars in money; Dec. 9th, from Mr. John H. Knapp, of Wisconsin, five dollars; Feb. 1st, from Mr. W. Crosby, of New York, five dollars, and from Dr. Ferber, Mr. Brooks, Mr. Steels and Mr. Benedict, twenty-five pounds of bacon and five pounds of coffee.

GAME PROTECTION.

Secretaries of game clubs and others are invited to send us early notices of changes in game laws, reports of the doings of societies and other notes of news.

THE DEPLETED GAME OF LONG ISLAND AND ITS RESTORATION.

BROOKLYN Feb 15th

BROOKLYN, Feb. 15th.

ONG ISLAND, that once famous Utopian, but now been totally exiled from the memory of a few gunners still living, whose conviviality filled the halls of Jim Smith's tabernacle in years gone by, and who still seek employment for the spaniel and the fowling piece among

Smith's tabernacle in years gone by, and who still seek employment for the spaniel and the fowling piece among her meadows, bays and woodlands; scenery rivaled by none elsewhere on the continent of North America. The pinnated grouse, once abundant from Brooklyn to South Hampton, takes no more its noon-day siesta within those obscure coverts; the drun of the ruffed grouse is heard less frequently than in former years, though this bird is by no means extiuct, and the noble stag, who in early days broke his fast and slaked his thirst where grew the filty pads in many limpid streams, have, save a few degenerated stragglers, left the slopes for holts far remote from the ruthless hand of man.

Albeit these denizens, like the red man, have fell by the tyranny of the pale face, Long Island still possesses attractions for the sportsman which might be multiplied were her game laws properly enforced. It was the neglect in this respect that suffered the extermination of the heath hen from the brush plains, though as early as 1791 laws were framed for her preservation, but alas! they mattered naught, as did the wisdom of the fool who closed the eage after the bird had flown. Nor would I portray faithfully the depleted vales and woods of our beautiful Isle did I omit the mention of one other fact, melancholy as it is true, viz., the destruction of "Great Point," at Montank, Timewas, and very recently at that, when if the goggles of wild geese that swarmed to this point in quest of their favorite food could by any endeavor be computed and placed before those who have never been there, the facts would be given the widest incredibility; and not wishing to fill the young sportsman's heart with the sorrowful regret that he had not been thrown into this world twenty years carlier, I may be pardoned if I omit the record of some of the begs mans neart with the sorrowth regret that he had not been thrown into this world twenty years carlier, I may be pardoned if I omit the record of some of the bags made in this vicinity, and simply add that if the eel pois be destroyed and the luxuriant duck-weed allowed to grow again, in a few years quite respectable shooting may be had at this old haunt; otherwise I prophesy the absence of those days forever

grow again, in a few years quite respectable shooting may be had at this old haunt; otherwise I prophesy the absence of those days forever.

But Long Island is yet a favorite hunting-ground. Myriads of wild ducks and geese throng to the placid bosom of her bays and inlets, and the little qualit is also abundant in some of the rural districts. Though I do not admire nor countenance summer woodcock shooting, I could take you, reader, were I so inclined, to where you could indulge to your heart's content in this unmanly sport; but I know you would refuse to go. I know of a covert whose familiar picture is now before me; a small piece of swamp and thicket whose full radius does not exceed two furlongs, where, on the 3d of July a year ago, well known parties from this city killed woodcock whose aggregate numbered into the forties; and on the day following another party, numbering four gentlemen, killed a similar quantity in a brake about a stone's throw from the first mentioned locality, which had been reserved for them; and had they sway over other lands adjacent the result of that day's woodcock shooting would have reached a heavy figure. All this was accomplished within a few hours in the morning. I have to add that each was constant that way to the table some of

pusiness within a 10% hours in the morning. I have to add that ere they found their way to the table some of them were a mass of putrefaction.

Such is a faithful representation of the past and present of the once famous one hundred and twenty-five miles of sand bar, and all, yes, I shall venture to say all, for the lack of wise legislation.

There are neglected to the control of the present of the control of the lack of wise legislation.

There are, perhaps, no gurgling streams, no meadows, no glens or leafy woods, in which the errant cow-boy can pillage with such safety as those upon Long Island. Obscured in a Suffolk County hamlet, he sets his snares when the sun is sinking belind the woods, and knowing their whereabout he served a surject the department. whereabout, he scarcely awaits the dawn when l has his traps emptied, account of stock taken, and while has his traps emptied, account of stock taken, and while yet the villagers are dreaming has found ready sale to some baggage master on the railroad. What does he know about section so-and-so of the game laws; much less, what does he care when ten cents may be readily obtained for a "plump" or perhaps a half-starved "Bob White"—poor "Bob," my heart beats with love for thee! andwhen he has promised the baggage master the day previous to bring such-and-such a number the next morning, and then roaming about the village "cock-a-doodle-doing" as to how he "ketched" "deven" qualis and "tree" woodpilo quawkers and "a duced of a big buck rabbit," and changes the silver from one pocket to the other for good luck on to-norrow, when, if by chance he should meet farmer Jones's African—gun he has none. So how can he be made to respect a legal notice? Who is going to watch him? What will be done with the small boys? going to watch him? What will be done with the nall boys?

It has been said to me: "What care you or I what

is going to watch him? What will be done with the small boys?

It has been said to me: "What care you or I what these fellows do, so that we have birds to shoot at?" I'm thankful that my mind was never trained to such a view of the question as that, and to tell the frank truth I pay far greater attention to the movements of the habitants of the woods than I do to the maneuvers of my own race. I want to see the lower class of animated nature protected; I want to see the lower class of animated nature protected; I want to see the few sections of law worth anything at all duly enforced; I want competent men to handle all the game legislation; and I don't want a two years prohibitory law, nor the shot gun taxed. It is not necessary to go that far at all.

And now, how shall we go about this thing effectively? I will tell you. Let every sportsman put in an appearance at Soneca Falls next July. Let the council fire be kindled, and let our supplications rend the windle. And attention. It is an American idea that when a portion of the community feel burdened with that portion of law relative to thom, they shall have a say in the matter. It is the duty of the State Association to think gravely upon this subject,

Mr. Editor, I give the prefatory notes upon Long Island to show what that locality was once, and to show what it is now, and what its future is likely to be.

HARRY FENWOOD

BOSTON, Feb. 20th.

MIGRATORY QUAIL.

Editor Forest and Stream :-

Editor Forest and Stream:—

The quail reach Messina in their migrations about the middle of March, and the flights continue until the middle of April, sometimes until 1st of May. A letter is from two to three weeks going from here to Messina. The latest possible time for sending an order (and getting it executed) would be the first part of April. The latest date at which an order could be sent and be probably executed would be considerably earlier. To make this clear I quote as follows from a letter of Mr. Braun, dated Jan. 17th, 1880: "A short time ago one of our Messina papers brought out an article stating that the catching of quail was to be prohibited entirely before next spring, and consequently I abandoned all hope of further exportations. But now I hear that the licenses which were given out last spring for the duration of one year will remain in force for their full term, so that those catchers who took their licenses late last spring can make use of them for a part of the next flight. New licenses are no more given out under the previous conditions. Before, any one that had a license could go catching anywhere in the whole Kingdom of Italy. The license was personal, and cost only 20 shillings. Now a new law has been issued, according to which the new license is personal and can be used only for a marked piece of ground been issued, according to which the new license is per-sonal and can be used only for a marked piece of ground not exceeding 25 meters (about 27 yards) in length, and 20 meters (about 21½ yards) in breadth; and, besides this, the cost has been raised to 60 shillings for each license. These determinations of course of away with all hope of These determinations of course de away with all hope of getting any more quail after next spring, as nobody can see his way clear to pay 60 shillings for a license on which he may, perhaps, be able to catch nortwenty birds during the whole flight. This is the work of our sportsmen, who fear that the increasing demand for live birds will reduce the stock of quail, and perhaps in time put an end to our quail hunting. As the birds appear here in such immense quantities, I doubt whether this would ever be the case, but I must acknowledge that the bird-catchers are very annoying indeed when one is out gunning."

It is plain from the above extract that it is better to have all orders in by March 1stat the latest. At the same time, it is not at all improbable that orders sent in aslate as the middle of March, or even, nossibly, the 1st of

time, it is not at all improbable that orders sent in as late as the middle of March, or even, possibly, the 1st of April, would be executed. Our first order will be sent forward on or before March 1st. If any who desire to import cannot get their plans completed by that time they can order later, and all orders received before April 1st will be sent along to Mr. Braun, the gentlemen ordering bearing in mind that in all cases Mr. Braun reserves the pearing in mind that in all cases Mr. Braun reserves the right to return the money, less the small cost of the ex-shanges, if he cannot secure the birds without loss to him-self. After April 1st I think it would be useless to for-

The following letter from Mr. Braun may be interesting to your readers.

Messina, Jan. 26th, 1880.

Mr. Horace P. Tobey. Boston, Mass., U. S. A.:—
DEAR SIR—According to your request in you favor, I will write you a few lines upon matter neeted with migratory quail, giving you in a few such facts as I have gathered from my own experies. A will be supported by respiration to the control of

Incident with migratory quall, giving you in a few words such facts as I have gathered from my own experience. I will begin by saying that the quall are not stationary with us, or at least not here in the vicinity of Messina. A few have, however, been found to breed in the plains near Catania. During their short stays here in spring and autumn they must be considered as travelers, and their habits are not the same that they are at their home—that is, at their resting place. They arrive here almost tired to death by their long flight across the sea, and oftentimes they are so exhausted that they full down in the streets of our city; then they can be easily picked up. Some that cannot stand the long flight are often seen to drop down into the sea, where they show them selves to be clever sailors. They lie quietly on the surface of the water and lift one wing to the wind, thus spreading a minature sail, by which they are carried saicly to the shore.

They migrate almost exclusively at night

shely to the shore.

They nigrate almost exclusively at night, very rarely in the day time. They generally arrive here in the morning early, remain during the day, and continue their migration the coming evening. When it is moonlight they fly high and alight upon the mountains; while with a covered sky they fly low and alight on the plains. I have not been able to find out here that the quait have a particular time for feeding and another for resting, as I have seen them move about in all hours of the day. This is owing of course to the irregularity and disturbance they meet out here. But in Germany where they next I have noticed that they have about the same habits as the partridges, viz., feed in the morning early, toward noon buve noticed that they have about the same labits as the partridges, viz., feed in the morning early, toward noon and at sunset, and lie up the rest of the day. They make their nests upon the ground, and are not very particular in the choice of their nesting-place. The female lays from eight to eighteen gray-colored and duck-sprinkled eggs, which are about the size of pigeons' eggs. The young, like the young of the partridge, are able to run about the day they are hatched. I have seen them run with a part of the egg-shell still on their backs. The quail generally does not breed more than twice a year.

The catching of the quail is done with nets and snares. The former implement, which is mostly used on the Italian continent, is the same kind of net that is ordinarily used in other countries for catching birds. The catching was the same kind of net that is ordinarily used in other countries for catching birds.

inn continent, is the same kind of net that is ordinarily used in other countries for catching birds. The catching is done at night, and in order to attract the passing birds the catcher uses a decoy whistle, with which he imitates the monotonous "pich-ter-wick" of the quail. The implement mostly used here in Sicily for catching quail is the snare. It is used in the following way:

— The catcher digs in the winter small trenches, about twelve centimeters (about four and seven-tenths inches) broad, in the field, on each side of which he sows cye, which forms in spring, when grown up, a kind of an alley. Across the trenches the catcher fastens, about fifty centimeters (about nineteen unches) apart, small sticks in such a manner that a quail can comfortally pass below them. To the middle of each stick a snare, made of he'l hair, is fastened, and in the trench some seed (her

is the best) is senttered. When the quail goes into the trench to feel on the seed it gets caught by the neck.

To your question what kind of dog we use here to find the quail, I must reply that in this country, where almost everyone pretends to be a sportisana, all kinds of dogs are used, even terriers and poolles not excepted. But no doubt spanishs and pointers are the best dogs for quail shooting. The quail generally squats before the dog, and remains a good while before starting to fly; but when it is rainy weather I have experienced that they don't squat, but run before the dog. Shooters here generally go out alone, and every one shoots on his own account. During the flight in spring our mountains and corn-fields are perfectly covered with shooters, and when quail are plentiful the firing seems like that of several regiments in a battle. With a good dog a practised shooter can well kill 100 or more quail in a day. Two years ago last April I shot with my central fire gun, callier 16, powder F F F and shot No. 10. seventy-three quail, from 5 to 8 c clock in the morning, and might have shot many more if I had been better provided with ammunition. Though the quail arrive here in large flocks they separate during the day, and are mostly found singly. Toward the end of the flight in spring they are often found in pairs. They stay only one day with us, and as they always fly against the wind it often happens that one day we have plenty, and if the wind changes in the evening not a single one can be found the next day.

MIGRATORY QUALL IN PENNSYLVANIA,-The following. taken from the Westchester (Pa.) Republican, will be of interest to many of our readers :-

Since the close of the shooting season sportsmen have been comparing notes in regard to the Messina or migra-tory quail, which were turned loose in Chester County last summer, and the general conclusion has been that the birds scattered over a large area of country on being the birds scattered over a large area of country on being set free. In conversation recently with a resident of West Marlbore' Township, he informed us that while out shooting with a companion in the fall the dogs flushed a covey of birds consisting of a hen and seven or eight half-grown birds. On rising they flew close to the ground in such a way that made it exceedingly difficult to get a fair shot, and the lunters out succeeded in obtaining one such a way that made it exceedingly difficult to get a fair shot, and the hunters only succeeded in obtaining one young bird, which they decided to be a cross between the imported and domestic breeds. This is the only case of this nature coming to our notice, but we would be glad to hear of anything in connection with the introduc-tion of these birds.

Migratory Quall in Virginia—Rock Spring, New Ballimore, Va., Feb. 9th.—As it may be interesting to those gentlemen who have been to the trouble and expense of importing and turning down the "European quall," I wish them to know through your paper that one pair settled close to me last year, bred and reared a bery of about a dozen. They never were disturbed by gun or dog all season, and only one young one was killed by chance, in this way: the colored boy when crossing a branch at the head of a swamp the whole bevy fluttered under the horse's legs, and he made a cut at them with his whip and killed one. What became of them after I can't tell; may be they are "away down in Tennessee" by this time, and should I hear of them again, or others, this fall I will report.

BOR WHITE.

THE NEW JERSEY LAW.

RAVEN ROCK, N. J., Feb., 1880. Editor Forest and Stream :-

Editor Forest and Stream:— AAVES ARCA, Red., Ped., 1886.
Your Mortstown, N. J., correspondent, "Jersey," goes over those who oppose his pet woodcock law rough-shod. There are before the present Legislature some half a dozen game law hills; not one that should be allowed to become a law, if the true sportsmen and the people of the State could have their say. No one of them is intended for the whole State, but for some favored localities. For instance, in Hunterdon, Mercer and other counties, woodcock bered in goodly numbers, and leave on the first full moon in July, or somer if the senson is travorable and are seldom afterward seen in those localities; consequently they have no fall woodcock shooting, although they breed them. seidom afterward seen in these locanities; consequently they have no fall woodcock shooting, although they bred them. Northern Jersey will receive all the benefits of such a law, as they go there during their moulting season, so there is nothing woodcrful in the opposition to the proposed law from parts of the State offected, while other lealities more favored are advocating

State affected, white coasts are the coasts and pual from the lock season for rabbits and quail from the lock of State of October, instead of November 1st as at present, and I have reason to believe their bill is now before the Legislature. Such a bill should be branded as the port-hunters' bill, calculated to exterminate the game of New Jersey before it is fit for use. What are achieved for of skill it would be to see a member of the Association sally forth on the 15th of October, flush a covey of quail, defeat them fint some grassy meadow, and then shoot them all tion sain state that the state of the state of them the shoot them all singly while they are yet tame, and some of them not much larger than sparrows. None but; littlenously lead shots and pothurrers advocate such alaw. Still this Association does it. Am 1

11 Senator Lawrence will introduce a bill for the prevention of wood-chopping, and to stop the sun from shining so hot, so as to not dry up our swamp lands, he will accomplish about as much in the way of woodcock protection as by the proposed law. No true lover of shooting wishes to see our game birds ruthlessly distroyed; July when one section of the State attempts to legislate in their own interest and against mother section, they will deduce the section of the section. utstrip ed; Jut when one can are a fact in their own interest and against another section, they will find opposition, and not altogether from selfish persons or notoriously bad shots, either.

Of the half dozen bills before the Legislature, there is but one.

Of the nair cozen bits netere the Legislature, there is but one that deserves consideration, and that is Senator Beekman's bill, prohibiting the shooting of game birds and rabbits from Jan. 1st to Dec. let. Amend his bill, make it read from Dec. 15th to Nov. 15th, then those villatinously but shots early in the season, and tracking snow hunters in the late season, will have to confine themselves to one month, which, owing to the growing searcity of game is enough for all practical purposes, the Association of the contrary notivitistanding. tion to the contrary notwithstanding FAIR PLAY.

NEW YORK, Feb. 18th.

Altor Forest and Stream:—
Although at the present not a resident of New Jorsey, I consider self somewhat of a Jorseyman, having lived there for the last afteen year

"Jersey's" belief that nine sportsmen out of ten are in favor of a law prohibiting summer shooting is, I think, wrong. I agree with him in regard to the law, but I do not believe that nine sports menout of the aw, but thou believe that imbespores menout of then are in favor of it. According to an old law of New Jersey, any man has the right to shoot on his own land the year around, or he can transfer his right to any of his friends, proaround, or be can transfer his right to any of his friends, providing he gives him his pernaission in writing. The upshot of it is that every year by the 15th of June the woodcock are nearly all billed. A few years ago—nor so very many either—I had occusion to co to Paterson on a visit on Decoration Day—that Is, the 30th of May. Happening to take a walk through the country with a friend of mine, a resident of Paterson, we heard, or rather counted, thirty-two shots fired in a piece of wood adjoining a swamp. We crossed the fence, and came face to face with the shooter. His dog was then on a point. Up jumped a half-fledged woodcock, and bang! went the gon. Evidently the bird was untouched, but as he could not rise three yards above the ground our sportsman's dog caught him in the air before he could alight. our sportsman's dog caught him in the air before he could alight. This sportsman proved to be a permanent and most active mem this sportsman proved to be a pertuanent and most herefore the here of the Paterson Game Association -so I was told afterward; but as he was shooting on his own land, he could see no harm in shooting woodcock on the 30th of May.

I have not the slighest doubt that if "Jersey" counts among his

nine-tenths this kind of sportsmen, he is certainly right; but if he counts as sportsmen people who cannot go out shooting ever they please, but only dogo when the law isoff, he is c

unstaken,

1 have not missed in New Jersey one single Fourth of
July for the last ten years, but I must confess I have found the birds becoming scarcer and scarcer every year, because they had been killed before the season by parties that hunted on their own grounds, or by some friends of theirs from the city, to whom they

had given permission to shoot.
If "Jersey" can prevail on Senator Lawrence to have this old law repealed, I have no doubt that he will find very little opold law repeated, I have no doubt that he will ind very little op-position to his bill; otherwise there will not be any necessity for this new law, as by the 1st of October there would not be left any more woodcock than there is now under the old law. The land owners and their friends would shoot anyway, and, as the bogs say, would have all the "pudding" to themselves. Issu up,

There is no such provision in the present New Jersey game law; and the old law referred to by our correspondent is repealed by the late laws.

BLOOMSBURG, N. J., Tebruary, 1880.

In this vicinity (eastern part of Warren County) we have very In this vicinity (eastern part of Warren County) we have very few good wooleook grounds, and the binds found only enable us to break our young dogs. During July we generally find a few birds and can manage to beg five or e six in an hour or two of hard work. In October or November we very seldom got a chanco at them. This is owing, I suppose, to their being all shot off during the summer. Lagree with "Jersey" in all that he has said on this subject. There is little pleasure in shooting half-grown or partly-feathered woodcock, especially when the thermometer stands at 00 deg. in the shade and nearly every thread of one's garments is saturated with perspiration. Old sportsmen here tell us that fifty or sixty years ago there were pleaty of good woodcock promote, and it was no strange

Our sportsmen arete ten us that fitty or starty years no there were plenty of good woodbeeck grounds, and it was no stranger feat for two guns to secure a log of stary birds in a few hours. Now nearly all of these grounds are utilized, and where once were large tracts of ables swamps there are farms or fields. Some of our selfish sport-men argue that if we get no shooting

in July we will get none in the fall, as woodcock move southward in July we will get none in the fall, as woodcock move southward then and are not to be found. How they know that none will be found in the fall I cannot tell, for there has never been any left after July to be found at all until the next year. Let us have no summer shooting at all and then we can know the truth. I am in favor of having qualit, woodcock and grouse shooting open Oct. Ioth. If we are to have no woodcock shooting until October I think we ought to quali shooting at one and the same time.

Game Bag and Gun.

GAME IN SEASON IN FEBRUARY.

Wild duck, geese, brant, etc. Hares, brown and gray. FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl "Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-carcher, surf birds, phalaropes, avocets, etc., coming under the group Limacola or Shore Birds.

GAME AND FISH DIRECTORY.

In sending reports for the Forest and Stream Directory to Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value: State, Town, County; means of access; Hotel and other accommodations; Game and its Scason; Fish und its Scason; Boats, Guides, etc., Name of person to address.

INFORMATION WANTED.

Correspondents are desirous of information of the above nature relating to (I) Bush River, Md.: (2) good quall shooting in Ohio on the line of the Pittsburg, Cincinnati and St. Louis Railroad: (3) localities for camping out in the victinity of Gratfon, or near the Cheat Mountains, in West Virginia; (I) sulpe shooting within (0) miles of Indiananolis, Ind.; (5) the name of aguide living at or near Brulé Lake, ninety-five miles north of Ottawa.

COOKING SEA FOWL.—New Bedford, Feb. 21st.—Your COGENER SEA FOWL.—Were Bedford, Feb. 21st.—Your correspondent takes the mode of removing the fishy taste of sca-fowl. If he will carefully remove the fat from the inside, and then skin them, soaking a few hours in water to remove the blood, he will find that sheldruke, whitewings, etc., will taste no more fishy than a duck or goose, and, in fact, a sheldruke served in this way is as patiatable as a wild partridge. Even an old loon under this treatment makes a very good dish. I write from CONCHA. experience.

Brooklyn, Feb. 92d.—My mother used to cook coots and sheldrakes in the following manner: First, put inside of each bird one or two onions, then put them into a pot of cold water, and set the pot over the fire until it just comes to a boil. Then take the ducks, rinse them out, and roast them same as any other fowl. Even coots, when cooked this way and served up with currant jelly, are not to be despised.

Long Island Sportsmen's Association.—A meeting of five delegates from each of the following sporting clubs of King County—Long Island Shooting Club, the Brooklyn, Foundain and Nassau Gun Club, and the Long Island Foresters' Club—was held last week at the rooms of the Long Island Club, and after a long discussion growing out of a misunderstanding on the part of the delegates of the Long Island and Brooklyn clubs, they supposing that the forner meeting was merely temporary in character, it was resolved that in order to remove all misunderstanding on the subject the "members of the soveral clubs now present do now enter into a permanent organization, known as the Long Island Sportsmen's Association." This was passed unanimously, and the following officers were then elected:—President, Mr. G. A. Chappell; First Vice-President, Dr. H. F. Aten, Brooklyn Gun Club; Scoond Vice-President, Dr. W. Wynn, L. I. S. C.; Third Vice President, W. Selover, Nassau Gun Club; Fourth Vice-President, Henry Thorpe, Long Island Foresters Club: Secretary, Abel Crook, Fountain Gun Club; Treasurer, R. Robinson, L. I. S. C.; Assistant Secretary, H. B. Cook, Fountain Gun Club; Treasurer, R. Robinson, L. I. S. C.; Assistant Secretary, Med. Crook, Fountain Gun Club; Secretary, Med. R. Cook, Fountain Gun Club, Was then appointed the officers of the Association being members on endowed the substant secretary and the substant secretary and the substant secretary and the officers of the Association being members on endowed the advanced and advanced to the works when by always will be adouted the additional contractions and advanced to the works when by always will be adouted the additional contractions and advanced to the works when by always will be adouted the contractions and contractions and advanced to the works when by always will be adouted the contractions and contractions and advanced to the works when by always will be adouted to the works when by always will be adouted the contraction and contractions and contractions and contractions LONG ISLAND SPORTSMEN'S ASSOCIATION .- A meeting the Association being members en-officio. The neeting adjourned for two weeks, when by-laws will be adopted and active measures engaged in toward effecting the object of the Association.

A NEW PENNSYLVANIA CLUB.-Northumberland, Pd., A New Pennsylvania Clutt.—Northumberland, Pt., Feb., 16th.—A meeting of the sportsmen of this place was held on last Saturday evening to form an association for the protection of fish and game. Officers were elected as follows:—President, Jesse James; 1st Yice-President, Jos. Amekst. 2d Vice-President, Sun. D. Burk: Treasurer, W. E. Taylor: Secretary, Joseph W. Everard: Mombers present Zachary Taylor, G. W. Smith, C. G. Jones, Jos. P. Heine, Geo, Savilge, Jas. K. Bright, Levi Bussler, W. F. Garrihan, Geo, Fieweg. This is something that has long been needed in this section, and if the right steps are faken it will be a great advantage to farmers and sportsmen. The association was named the Susquehama Sportsman Association, and a bounty of fifty cents will be putd for all hawks killed within a certain distance, except to members of the association.

ciation.

Onto—Woodstock, Fcb. 18th.—This has been a sorry old winter to the lovers of field sports in Ohio. No quail shooting, and on account of the mild winter, no other shooting to speak of, until within the last few days. There have been a few wild pigeons flying, but no regular flight that I have heard of. I have not seen a dozen wild ducks this winter, which is something remarkable in our part of the State.

Obvert Reviller 1. On the Control of the State.

Orgons—Fortland, Jan. 93th.—In company with B. of Cedar Creek, W. T., I paid a short visit to the flooded grain fields of Washington County last Saturday, and we had some fine sport, bringing home thirty-six ducks. Saw numbers of ducks, geese and swans. We experienced a hearty welcome from Mr. J. L. Hallett, at whose hashbased from the firm we made our headquarters, and whose hospitality is always extended to the spottsman. At a small lake near this place a short time ago one of the farmer boys killed twenty-nine ducks at one shot, and cripiled several more. MULTSOMAR. crippled several more.

rippled several more,

annual control without Forest and JUST WHAT WE HINK,—materialpois, Int., Feb. 1601,—Of course I cannot get along without FOREST AND STREAM. No orthodox minister can live without it and not suffer. I am waiting for the duck season to open, and meantime occasionally clean my gun.

M. W. R.

meantime occasionary cient my gint.

Elistrophi, Wis., Feb. 8th.—I have shot buckshot at deer with good success. First, you can't expect what to go true unless they are round; and, as you buy them, there is lurdly a perfect one in a sack. They all have tents and feathers, which uds as rudders to steer them.

So I take an old life and brush off all of these one by one So I take an old life and brush off all of these one by one, and drop them into an old stone jug, throwing away all that have holes in them. Then shake for about a minute, till they are all smooth—then I have perfect shot. Now, in loading shells, the more powder you use the more force you get on the shot, and the more they scatter, 'so in loading, decrease the powder instead of increasing, as most men do. I use in twelve shells 2½ durans F powder, and four layers of buckshot; that will chamber four. I I find they make an even spread, with sufficient penetration.

SOME GUNS THAT I HAVE OWNED

IN what I am about to write, I solemnly disclaim any intention of either praising any make, or makers of

IN what I am about to write, I solemnly disclain any intention of either praising any make, or makers of guns, or to record anything to their disadvantage, but simply to give my own housest impressions of a good gan, and to say something of some that I have owned.

It was in 1849 that I bought my first gun. The callow days of sweet sixteen made an book upon that gun as perfection. Thirty-six inches in the clear, with 1 drop of saven inches, and pot-metal, as I am a sinner, and 14 bore, she would kill squirrels like a stroke of lightning, and would kiek like a newspaper mule. Years have rolled over my head since, and I have had many hairbreadth escapes by flood and field, but on locking back, with my present knowledge of guns, I think I was never in more danger than when I fired that gun with a full-size clurge.

full-size charge.

In the light of subsequent events I now know it. In the light of subsequent events I now know it. My uncle owned a slave, thout my own age, whom I Leaf taught to shoot, and who was my Filos Achdeks, accompanying me in all my hunting excursions. The highest ambition of this sable sportsuant was to kill a "greenhead" duck. Finding that he was never allowed to kill one when with unch e stole the gun one Sunday and marched down to the creek, accompanied by the whole "dropshot" gang of the plantation. Reasoning, like many other philosophers, from a sound basis, but arriving at an erroneous conclusion, Pete put in two charges of powder and shot in each barrel, thinking that, if one charge would kill, two would do the work much better. Finding a large flock of "green-heads" trusting to the saucity of the day, and quacking as they never do quack except on Sundays, aloed by the shelter of a water-fence Pete crept to within twenty yards of the devoted birds. Resting his gun on the fence and taking careful aim, he pulled both triggers at once! Never was Sabbath stillness broken by a near outrageous rear! It came booming into the windows of the country church, and startled nervous old ladies and stopped the choir in one of their grandest efforts. What time Pete lay on his back with one arm broken, and a very large segment of his woolly scalphbown clean away, Islail not record; nor how he was toted up to the "big house" by his mother and his father with lond ultulations; nor how the chorus was swelled by the "drop-shot" gang, each of whom bore a "greenhead" as a peace offering to the offended powers; nor how I found the barrels blown entirely off the stock, and a yawning chasm in each to show how strong Dupont's FFG powder really is; nor how Pete, fully recovered, never ventured to fire a double charge any mere, forever! My gun was gone, and this was the end of my first gun; and, indeed, marked an epoch in my sporting experience and my knowledge of guns. Not long after this my uncle went to Philadelphia, at that time the city to which most good Western men went. Ho brought with him a lot of cheap English guns, but all of them strong and serviceable. Among them was a little gun. 28-inch barrels, and 14-bore, which, after long persuasion, was turned over to me, "to have, to hold, and to keep,." I am afraid to say how much gone I killed with that gun, nor can I tell what hard usage it had; but it served me honestly and faithfully for long years, and with it I became a better shot on the wing than I have ever been since. I have killed deer with it, often, and wild turkeys too numerous to mention, and, as for ducks, though inferior to some large guns that I have cowed, yet she would kill them at fifty or sixty yards, nearly extended to a second to the wing than I have ever been since. I have killed deer with it, often, and wild turkeys too manerous to mention, and, as for ducks, though inferior to some large guns that I have cowed, yet she would kill them at fifty or sixty yards, nearly extended.

yet she would kill them at fifty or sixty yards, nearly certain.

Years rolled on, and I left the home of my boyhood and went South. I gave the old gun to a cousin, and determined to buy a fine gun next time. And I did, too. None of yonr 835 guns for me. I ordered a Westley Richards, for which I paid \$185; and, for the price, it was the poorest gun that I ever evoued. I used it for two years and then sold it for \$75, which causes me to say that in all and-unde guns there is a great difference in the shooting qualities or gun that are honestly made by good makers. Some defect in the boring or in the finish will cause poor shooting. And here also let me say that afterward wnsed a Westley Richards, the gift of a dead friend, that was all that a gun could be. Costing, I believe, \$375, or 15 guineas, it was a superb gun. Its only fault was that it was too small. Almost all guns in those days that were made in England were 14-bores. Such guns would suit English sportsmen, for their game shooting is at a much closer range than ours. But this gun, if held fairly on, would kill a quali every time at sixty yards clean, and would shoot No. 4 shot at ducks with a power that you never see in the modern breech-loader-weapon worthy of any gentleman. It was carried off by some negroes cabin as "do bestes jun in de State." Farewell, old gun! Never shall I own one that is for a moment comparable to thee, honest gun, made by honest men. Immediately after the "wash" I bought another English gun—Bomehill, I think, muzzle-loader, for which I paid \$15. She did famous work, too, among the birds, but was entirely worthless with coarse shot. She would shoot up to fifty or sixty yards with 8s or 8s with as much vim as any of them; but put in a charge of 6s or 4s, and turn loose among the ducks, and you came home at night with a very light bag. The next gun that I owned was a Dowell, muzzle-loader, a maker whose guns are evry popular in the South. Thirty-two inches in the barrels and of eight and one-half pounds weight, she was a superb g ream, Years rolled on, and I left the home of my boyhood and

barrels and of eight and one-half pounds weight, she was a superb gun with No. 6 shot. I have often killed ducks with her at ninety yards: but with 10s she was "no account."

And this brings me to the subject of breechloaders vs. muzzle-loaders. Unthinking partisans of each mode rehemently contend for their own mode. Now both are wrong. When breech-loaders were first made there was a want of penetration and, indeed, of pattern. These defects have been climinated in a great measure, and now most good breech-loaders shoot had und close. Of course the old-fashioned breech pattern could not give the same penetration as the patent breech, shaped like the letter V, in the nuzzle-loader. But by choking the gun, or boring so that the diameter was less at the nuzzle, the breech-loader could deliver the charge very compacity, and by the use of the wads on the powder the gas was so conlined that penetration was secured. A first-class muzzle-loader is had to beat. Indeed, to tell the truth, put the best breech-loader in the world against the best muzzle-loader will go to the wall, especially in penetration. Let wild statements be made on either side, but this is sober truth. Hear the conclusion of the whole matter. In using the breech-loader you get rid of three musances at one fell swoop, the runned, the shot-pouch and the powder-flask. You load your shells at home by a fixed charge and do not trust to uncertainties. How often in our muzzle-loader, Allaports une matter and penetration or range, will render the shot-pouch and the powder-flask. You load your shells at home by a fixed charge and do not trust to uncertainties. How often in our muzzle-loading days have we cut off about 23 ox. shot instead of 14. All then there was a black shoulder when that gun was fired. Then, for flexibility of use, not when all defects are cured, equality of pattern and penetration or range, will render the breech-loader so over flexibility of use, not when all defects are cured, equality of pattern and penetration or range, will render the

Intely safe. No common gun is safe. The daily strain upon any gun will develope its hidden weakness with even 3 drs. of powder and 1 oz. of shot. And here let me say that I find 3 drs. of powder and 1 oz. shot amply sufficient for all upland shooting. When game is wild I put in 31 drs. powder, 1 oz. shot. None but the merest tyro will use 4 drs. powder, and 14 ozs. shot in a 12-gauge gun in upland shooting. The discomfort of the severe receil, the added noise and smoke, and the inevitable headache resulting from the successive shocks, render the lighter charge the favorite with all knowing sportsmen. Early in the season, for quall shooting, I use 21 drs. powder and I oz. No. 10 shot. With No. 12 I can do good work, but my first bird from the covey is torn to pieces on account of the great number of shot with which I strike it.

Again, there is another mystery that science cannot solve. I once had my boat anchored in a mill-pond among buttonwood bushes for the purpose of shooting ducks. Now it was impossible to shoot on the wing, for abova and all around me were gigantic cypresses, clothed from head to foot with moss. Immediately in my front was a clear space about twenty feet square. In this clear roosting-places in the adjoining bushes. Well, my first visitors were a pair of wood ducks, killed dead as the traditional Caser with one barred. Hardly had I slimed in

was a clear space about twenty feet squite. In this clear piece of water the ducks would alight before seeking their roosting-places in the adjoining busines. Well, my first visitors were a pair of wood ducks, killed dead as the traditional Caesar, with one barrel. Hardly had I slipped in another shell when four mallards floopped down—three of the four killed dead.

In rapid succession they came, mallards and wood ducks. I missed live shots out of sixteen at twenty-five yards. That the shells were loaded alike I know, with ½ onnee No. 6 shot, for I loaded them myself. Now, who can account for those five misses? Every bird must have been hit, for the miller found three mallards in the pond the next morning dead; and as I was the only person shooting in the pond on that evening I presume that the birds fell to any gun. Now, no one can say that at the birds fell to any gun. Now, no one can say that at the birds fell to any gun. Now, no one can say that at the point-lahak distance I should not have killed every bird, "Unaccountables," says some wise fellow. That is no answer. If a good gun—and I shoot no other—every charge should be distributed in precisely the same numer.

with a promise that I shall resume this interesting sub-With a promise that I shall resume this interesting subject again. I will close by saying that no one can tell when that accommodating and often contrary weapon—a shot gun—is going to shoot. You drive your charge of No. S clean through a bird, and the next one escapes for want of penetration. You hit one with two dozen shot, and another one at the same distance and same barrel is killed with two shot. Who knows? Quien sabe! With this consolatory reflection I sign myself, Lawtonville, Ga., Feb. 5th.

SHOOTING MATCHES.

Scores.-Secretaries of clubs are invited to send in scores of matches. Such reports should reach us as early as possible after the date of the meeting.

GOOSE-EGG SHOOT.—The members of the Fountain Gun Club A GOOSI-EGG SHOOT.—The members of the Fountial Gun Club of Brooklyn, L. I., held theiramusul Washington's Birthday shoot on Monday, 3d inst., at McMahon's Atlantic Hotel, Sheepshead Bay, L. I. The club members and friends left their elegant rooms at Harry Miner's in carriages about noon, with all the conveniences for agoud afternoon's sport. The shoot was merely a contest for sport made by dividing the club into two sides of 17 non each Fountain Gun Club rules; ground traps; 5 birds couch, at 23 yards rise. The strong cold northwest wind prevailing will account for

among the reasons way the culo has always a large turn out. The meeting on this occasion was an unusually large one, exenteen members going to the score, with the hope of winning the club's trophy. The shooting began shortly rafter 3 o'clock, and Mr. Erb had furnished a fine lot of birds. The wind, which was blowing a gale from the sever to the traps, made the shooting unauxily difficult, but this interfered but little with the good form usuany annead, but this interfere our first want the good rotal of the cracks of the club. After a closely contested bout between Mr. R. H. Brienthall, Mr. Hayes and Dr. Phideli, the trio which won the New Jersey State Association Cup last Getober, and Mr. John-son, the former landed himself the winner, with a clean sever of 10, each of big antagonists recording 9 out of 10. The flue shooting each of his antagonists recording 9 out of 10. The fine shooting of Mr. Brientall is worthy of comment, as almost all of his birds were hard-drivers, which were silled, as the score will show, without the use of the second barrel, save on the eighth round. Outside the ground, and surrounding the inclosure, there was a large army of "outside shooters," whose incessual ricket five did much palarm the more fortunate of the feathered tribe. The turnivalent of the feathered tribe. to alarm the more fortunate of the feathered tribe. The turn-pilito road presented an unusually lively appearance, particularly when the outsiders indulged in a go-as-you-please after an escap-ing pigeon. During one of the laps, the accidental and rather premature discharge of one of the "Lone Tom's" occasioned nuch commont; but, as it only renoved the two ornamental but-tons on the back of a coat of one of the shooters, the race went merrily on. The most successful of the outsiders was a gentle man whose residence adjoins the grounds; besides exhibiting some really fancy shooting from his diming-room window, he produced one fine bird which had perched on the chimney of his produced the intermediate and rectain out its elimited in the house, by adjourning to the kitchen and emptying the contents of his breech-loader up the flue. These, and other like incidents, marked the afternoon's sport. The following score will show who

indid the best work: Conditions: At 10 birds each; from five traps; handicap rise

The Rifle.

RANGE AND GALLERY.

MASSACHUSETTS-Boston, Feb. 13th.-Mammoth Rifle Gallery. Massachustics—Boston, Feb. 13th.—Mammeth Rife Galleru.—The the third week of the month has shown better shooting than the two proceeding ones, and the crack shots of this section have had large scores accorded to them. Mr. Frank Hollis, of the Medford Rife Association, was successful in getting a clean score the first of the week and placing himself third on the list. Mr. Hollis was the first one who ever made a clean score in the gallery, which was in April, 1879, and this is his second one. Mr. E. F. Richardson got two clean scores this last week, which makes four so tar this month and places him to the front for the extra prize of \$30 to any one making the highest number of clean scores during the month. Mr. N. Wilder and Mr. Richardson are tie on the \$30 ritle match, with the three highest possible scores cach, followed closely by Messrs. Hollis, Edwards, Pollard, Harrison and Merrill. The following is the standing of the several competitors to date: 150 fect; rounds 8; possible 40; three scores to win:—

| E. F. Richardson | 40 | 40 | 40 |

G. E. R.

MASSACHUSETTS—Boston, Feb. 23d.—The gentlemen of the Massachusetts Rilio Association celebrated Washington's Birthday with a grand shoot at Walnut Hill. The weather was very disagrecable, rain and sleet, with the wind from 6 to 10 o'clock. Some good scores were put up. Captain Jackson used his military, and with his gift he put in two 40's consecutively. Mr. Tyler used a military also, and his score was 48. The other gendemen did fairly well.

There were fifty-cight entries. We give below the scores:—

5 5 4 5 4 5 5 5 4 5

Record.-Salem, Mass, Feb. 19th.-In the columns of your paper.

worse results than the disease, I think even army mules ought to worse results than the discusse, I think even a ranky mules ought to be oxempt from taking them. And so with the rille, let it kick, for it will do the best work in that way. I am satisfied your correspondent's knowledge must be very limited on riles, for, if the rille kicks the moment the powder burns, as your correspondent would make us think, Crockett would never have killed bis coar; and the only thing I wonder at, is that he didn't get two kicks over time be fixed a meaning and the coarse time be when the rowder burnel and enother the coarse. every time he fired; one, when the powder burned, and another when the ball left the muzzlo of his rifle! And, should your corwhen the ball for the indized of, h.s. The: And, should your correspondent continue his tests, he may be able to cause his rife to push ahead when he fires if and stop its multisk kicking, making still better scores, and gerting better penotration—the two great desiderata sought for.

I am of the opinion that recoil, or low trajectory, and great pen-

ration are incidental to each other; and when your correspond-ent asserts that better shooting would result from his now methods of leading, I must take issue with him and propose that be back up his statements with scores, and not the pen, which is mightier than the rifle and more apt to make a bull's-eye.

PENETRATION.

A Georgia Hunter.—Bryan, Ga., Feb. 18th.—Editor Forest and Stream:—I read with much interest Mr. Rabbeth's experiments with the "Express builet" in your issue of Jan. 8th, and have seen no mertion made since of the "Winchester express" mentioned by him. I have one of these ritles that I bought last fall, ed. 50, 55 grein powder and a more neefect yau for a hunter I do not 95 grain powder, and a more perfect gun for a hunter I do not is grain powder, and a more perfect gun for a hunter I do not think can be unde. The trajectory is almost flat up to 150 yards, quite as fur as a deer can be shot at with any hope of killing. The bullet has in every instance with me worked perfectly, and I do not believe there are many animals that can stand up against the shock of the ball. I can only vouch for deer; for them I isk no betier gun. I shot a steer to try the gun, and the interior of the head was "forn to pieces"—as a friend remarked, death was so instantaneous that the animal would not bleed properly when the throat was cut. I can shoot very rapidly with the gun; the recoil is very slight, not more perceptible than with the .44 wad 73, and I feel that with this gun it is my fault if my deer goes off. I do not wish to say that deer have not been killed over 73, and I feel that with this gun it is my fault if my deer goes off. I do not wish to say that deer have not been killed over 150 yards, but very few are killed over that distance in any country that I have seen, and when I kill one at 100 yards I feel very well satisfied, particularly if said deer was running. As you know, I have no interest in writing about the Winchester, except that I am perfectly satisfied with it. As for accuracy, I can put my bullet every time where I hold the gun, and if said ball its not where it should be the fault is mine, not the gun's. The bullet will open instantly on touching a deer, and when shot too far back, instead of losing your meaf, as is the case often with a which per instantly for your meat, as is the case often with a deer shot with a small ball behind the vital parts, my express opens such a hole when it goes in that the blood at once rushes out in such volumes as to son stop the animal, and to trail can be followed without trouble.

G. L. A.

Archern.

PERSONAL.—Mr. J. O. Blake, formerly with Mr. E. I. Horsman, of this city, and well known to the archery world, has become infec-ted with the enthusiasm of the Western Toxophilites, and followted with the enthusiasm of the Western Toxophilites, and following the star of empire, has repaired to Chicago, where the bows are popularly supposed to twang the loudest and the arrows fly the thickest. Mr. Blake now presides over the archery department of Mr. Wilkinson, 77 State street, Chicago, where he will welcome all his old friends. The Brooklyn Archery Club tendered him a farewell banquet, and presented their departing comrade in arms with a handsome album of Piersali's excellent photographs of the club's members. He, he!

NOTTINGHAM VS. ASCHAM.—On Washington's Birthday, Feb. 23d, the Nottingham Archery Club of Elizabeth, N. J., paid a visit to Brooklyn, E. D., and there engaged in a friendly contest with the Ascham Archers at their hall, corner Division avenue and

the Ascham Archers at their hall, corner Division avenue and Clymer street. Sides were closen by Dr. Bailey, of the Nottinghams, and Mr. Chapman, of the Aschams, live gentlemen and four ladies shooting on each side. Three rounds of 30 arrows each at 30 yards were shot with the following result:—

18.30 2439 304 30 30 30 18.30 18 the contest a team shoot of 30 arrows at 30 yards took place beween the two clubs with the following result:-

NEWS AND OPINIONS FROM BOSTON. -- Boston, Feb. 21st. -- One fine NEWS AND OPINIONS FROM BOSTON.—Boston, Feb. 21st.—One fine afternoon the past week I went out on the range and shot the American Round with the following score: 60 yards, 92; fifty yards, 108; forty yards, 103. Total, 339. As I had not shot out of doors since October last, nor since that time at a longer distance than forty yards, I was gratified to find the total score to be just equal to my best score of last full, and I feel that practically our todoex names a success. indoor range is a su ccess.

MODOF range is a success.

We Eastern archers are sorry to learn that the National Association did not adopt Mr. Maurice Thompson's recommendation, to admit to their competitions archers outside of the club members of the Association. There are several Eastern urchers who would be willing to pay a reasonable entrance fee for the privilege of shooting in such a competition, but being alone in their club in that desire they would be expected to pay the expenses for the club, which with a male membership of fifteen to twenty is more than they care to pay.

The Private Practice Club has in view a worthy object, and we The Private Practice Cuto has in view a wormy object, and we shall look with greatinterest for its monthly reports. Wo wish it success in all its atims, though there is in its rules that which will prevent our becoming members. We object to cash prizes as an inducement to shooting; also to the payment of a penalty which we cannot have the benefit of unless our citaly joins the National Association.

It is intimated that the Eastern Association will, under certain restrictions, open its meeting the coming season to side of club members of the association. A. N. DREW.

MICHIGAN ARCHERS.—Battle Oreck, Mich., Feb. 6th.—The following record may not be uninteresting to some brother

archers. It is a practice score of ten days-Jan, 21st to Jan, 31st inclusive, Sunday excluded—made by a six month's man, Mr. Frank
H. Duncan, of the Battle Creek Archers, at a distance of thirty vards. Its chief interest lies in its particularity :-

Average to end in 101 rounds
Average to arrow in 101 rounds.
Total number arrows.
Distance walked. 7+ (approx.)

Total number arrows.

Jistance walked.

34 units.

 Tran Dbs Moines Toxophilites.-Des Moines,
 Rl., Feb. 5th.-

THE DES MOINES TOXOFHILITES—DES MOINES, III., ECO. S.R.— As "experience meetings," or more properly retrospective views on the past year of archery, seem to be having a boom, I feel that the West should not withhold its mite. The Toxophilities of Des Moines have had a very pleasant and satisfactory season, and can look back on the past and note with commendable pride their look back on the past and note with commendable pride their progress as a club since their organization, two years ago. Our scores by the lady members at the Columbia Round have ranged from 300 points down. For gentlemen at the American Round, from 500 points down. No long ranges were attempted last sea. from 500 points down. No long ranges were attempted last sea-son by the club. Our weather is too cold and the winds too losis terous for successful practice of archery during winter months' and only in a fow instances since last October has any archer been rash enough to attempt it. I am aware of the fact that it is early to speak of the grand national tournament to be held at Buffalo. to speak of the groud national tournament to be held at Buffalo, N. Y., four of five days of next July. It seems to the writer that as everybody is entitled (or ought to be) to a fortnightly vacation in midsummer, would it not be a good idea for all who desire to go to lay their plans and husband their resources with this end in riow. There certainly cautor be a more delightful trip—by land or water—to this beautiful city by the lake to enjoy

trip—by land or water—to this beautiful city by the lake to enjoy a fow days? recreation in one of her many handsome parks and almost in earshot of one of nature's grandest and most wondrous works—Niagara Fulls.

Tac Hussey
A Comancies Bow.—Beston, Feb. 4th.—I have read with interest the articles on the different woods for bows and beg leave to offer a mite on the subject. Years ago I was in the habit of making bows of red cedar, which one gentleman preferred an inquiry about. I found the material excellent, so far as clasticity was concerned, but brittle, and apt to warp. Pursuing my experient of the agents of the service of the latest of the service of the property and backet or the service.

about. I found the material excellent, so far as elasticity was concerned, but brittle, and apt to warp. Pursuing my experiments, I glued a strip of leather along the back to counternact the latter-fault, and, pouring oil over the wood, lightlef it, and scorched it, I found it toughened the wood considerably, and for years never used any other bow. I have in my possession a Comneba bow, the description of which may be interesting:—

Length, 3 feet 3 inches; width, 2½ inches; thickness, i inch; made of spruce, and backed with a mat of buffalo sinew, glued so firmly as to defy both weather and time. The string was also of sinew; and after I broke if, I never could get another inta would stand the strain. A sheaf of arrows accompanied if, that were also a curiosity in their way. The shafts were in two parts, (i) A 30-inch reed apparently, with a woody outside. (3) A short piece of wood inserted in the end, of an equal diameter as the shaft, to which the stone and head was fastened with sinew resembling eatgut, while both joints and feathers (hawk) were fastened with thin bands of the same. The whole was about thirty-three inches in length; and I have seen a strong man draw that three-feet bow to the head, and send an arrow over a fence one hundred and sixty-three yards away! I could not do it though. J. P. Trae.

Another Indian Bow.—Putnam, Conn., Jan. 31.—Pifty years

Another Indian Bow.—Putnam, Conn., Jan. 314.—Pifty years ago I saw a very old bow and arrows at Yarmouth, Mass. It was said to have been used by an Indian who lived near Plymouth at the time of our forefathers. It was made of a limb of cedar, and the time of our forefathers. It was made of a limb of cedar, and beautifully proportioned, and was worn very smooth. Around the middle was a fine braid, which was filled up with a kind of glue. It looked as if it had seen a deal of service. There were two arrows with it. I thought they were made of walnut. They seemed to be heavy, were pointed with sharp stone, and other end feathered for about seven inches. The arrows seemed to be stuined with blood. I carefully measured the bow, and afterwards made one as near it as I could, and it was the best bow I eyer saw. I killed considerable game with it. I pointed my arrows with glass, and many a woodchuck I have tumbled over. I once recollect shooting two partridges from a tree that our dog Bose had treed. Game of all kinds was abundant there, especially about the Plymouth woods. Bose had treed. Game of all kinds was abundant there, especially about the Plymouth woods. G. F. W.

HORSMAN'S ARROWS .- New York, Feb. 21st .- Editor Forest and Stream:—My attention has been called to a communication from Mr. L. L. Peddinghaus which appeared in a recent issue of your

While Mr. Peddinghaus' remarks were, to some extent, compli-

While Mr. Peddinghaus' remarks were, to some extent, complimentary to my make of arrows, they had a tendency to mislead the public mind in regard to what I am now manufacturing.

I quote from his letter:

I quote from his letter:

I quote from his letter:

I quote from his letter:

I quote from his letter:

I quote from his letter:

I consider the form of the form of the form of the first perfectly, so they will not bend whenever they strike anything hard, and puts his feathers on without cutting creases in the stele, then they will be the par excellence of arrows.

While these remarks may apply to last year's goods, they do a great injustice to the "par excellence of arrows" which I am now making. The "pile" I now use is bored from solid metal. The "stele" is made from the same English deal as used by Aldred, of London (which I import), and fist the pile perfectly.

London (which I import), and first hee pillo perfectly.

Into longer cut "creases" or grooves in the "stele," but glue the feathers on the outside surface. All my footed arrows are feathed with peacock feathers.

Inave spared do expense to make my arrows absolutely perlandered to expense to make my arrows absolutely per-

I have spared to expect the following letter will prove.

E. I. HORSMAN,

CRAWFORDSVILLE, Ind., Feb. 2d.

Mr. E. I. Horsman:

DEAR SIR:—On Thursday, the 29th of January, after the meeting of the National Association at Chicago adjourned, several of

the distinguished archara present smong whom were Mr. Henry the distinguished archers present—among whom were Mr. Her C. Carver, Mr. W. B. D. Gray and others of the Highland Park is clety; Mr. Tae Hussey, of the Des Moines Toxophilites; Mr. P. Chester, of the Commodus Archers, of Lawrence, Kan.; Mr. T. Church, of the Charlotte Archers, of Larlotte, Mich.; Mr. Watter Burnham, of the Chicago Archers, and several others, including your lumble servant—went down to the Exposition Building, and shot twenty-four arrows at sixty yards. Every man used your new footed, peacock-feathered arrows, and without ex ception pronounced them to be the best arrows ever shot.

You have achieved perfection, and American archers ought to rise up and thank you. Since I came home I have shot them with Mauries, and he pronounces them simply "superb." Sincerely yours, Will H. Thompson.

Wricket.

AVERAGES FOR 1879.

YOUNG AMERICA CLUB OF PHILADELPHIA.

This crack club of the United States played in all, twenty-five matches, thirteen first cleven and twelve second eleven. Of the first, nine were won, three lost and one drawn. The second eleven won eight and lost four. The first cleven visited Hoboken to play the St. Georges of New York, and Baltimore to contest with the organization of that city. The second eleven played three natches and won them all with ease. It is unquestionably the strongest second eleven in America. The following summary of matches and averages, both batting and bowling gives the record of the season:—

OUR POLICY.—We have recently received from many promi-nent cricketers, both in the United States and Canada, the warm-est congratulations in regard to our policy in editing the cricket columns of this paper. We must confess that these encombuns have made us feel more than repaid for our care. Let us, how-ever, at this time define clearly what our policy really is:—It is not ever, at this time define clearly what our policy really is:—It is not only the correct publishing of a certain number of scores and averages, but it also aims to advance the popularity of our game of games. It is an undisputed fact that the large and widely scattered circulation of the FOREN AND STREAM has done more in one year to unearth the lovers of cricket in this country than was one year to unearth the lovers of cricket in this country than was ever done before. We, therefore, often leave the cricketing centers behind us, believing that Philadelphia and New York, and other like places, are full able to care for themselves, and go out into the by-ways where the broomstick stumps and sting-handle bate still hold undisputed sway. To their enthusiastic owners the cockles of our heart are warm, and we would now say a word in their behalf. If an annual match could be arranged by the American Cricketers' association, the proceeds of which to be devoted for the encouragement of the game in charity schools and out-of-the-way places in the United States, where proper cricketing the-way places in the United States, where proper cricketing material otherwise would never find its way, it would do a vast amount of good, and at least practically attempt to do what is talked about a great deal—"the advancement of American cricket."

Nachting and Canoeing.

Meeting of the National Yachting Association. March 1st, at the St. Denis Hotel, Broadway and Tenth street, at 8 P.M.

THE BUSINESS OF THE N. Y. A.

N the national coat of arms of Belgium is the legend, "L'union fait la force." In all great enterprises, whether of a commercial nature or otherwise, combined action has been found conducive to the best results. That a powerful and influential body should move more rapidly to the goal of ripe development and complete success than the isolated and limited efforts of individ-uals stands to reason. It is for promoting the common good that clubs are formed in which the individual loses his identity in a class, and similarly it will be for the benefit of all that the clubs again should combine in a general association of national range and strength, in which the preponderance of local influences should be sunk with a view to the production of grand results beyond the ac-complishment of clubs in their capacity as detached bodies. Almost all varieties of sport have come to recognize the force of these remarks, and have banded together for the attainment of general prosperity and the welfare of those devoted to a specialty. The time has now arrived for yachtsmen to follow suit and take up the wake marked by the jockey clubs, base-ball leagues, athletic organizations and boating fraternities. growth of yatching in America has, owing to the great extent of our coast, the distance between ports, and the different local influences at work, as a matter of course, been surrounded and affected to a more or less extent by a great variety of customs and practices. It is desirable to unify, codify, purify these, and settle down to sound and rational principles of government, so that in the future the sport may more rapidly attain the promising spread in popularity and healthy expansion upon permament foundations which have of late years opened up to it.

It is for this reason that Forest and Stream was the first to advocate the institution of a central national com-

bination of yacht clubs, and we are glad to see that our influence seems to have been sufficiently powerful to bring about the convocation wished for, and our thank are due to several minor contemporaries for the ready manner in which they have fallen into line and taken their cue from these columns. We will now point out, in a general way, in what directions the National Yachting Association, soon to assemble, can exert its labors to the best advantage. Among the many subjects it should lend its consideration to, we deem the following the most essential, premising that as liberal a course of deliberations as consistent with beneficial and tangible effects will bring about the most far-reaching and acceptable results :-

results;—

1. The adoption of a strong constitution and by-laws, under which the National Association is to have life and act.

2. The appointment of a committee of appeal, to whom questions at issue and disputes of local or club authorities and judges can be referred for final adjudication; in short, an executive committee, with defined duties and jurislication.

3. A uniform system of classification for the entire country, so that actual each jurislication for the entire country, so

that a single and intelligible denomination of class may be adhered to from Maine to Texas.

4. A rule of measurement, the same for all yachts without exception, in which the five axioms enumerated in our last issue

shall be strictly observed.

5. A common set of sailing rules, defining the rule of the road

and the amenities of yacht to yacht, whether ernising or racing.

6. All matters relating to ballast must be settled according an accepted plan. If shifting ballast cannot yet be abolished, manner of shifting, the kind of ballast permissible, and the classes of yachts which are at liberty to avail themselves of shifting. uld be fixed upon. Rigging out dead or alive ballast on pla or by means of rope spans should be discountenanced, and the evil limited as far as possible, if deemed advisable, by offering the inducement of more liberal prize money to races sailed with fixed ballast. An expression should also be given concerning

dumping or spilling ballast after the starting gun.

7. The limitation of crews to the number necessary to handle racing yachts, so as to do away with live ballast and excessive

rigs. 8. The definition of a Corinthian and a professional for obvious

easons. 9. Time allowance adapted to various measurements and lengths

10. Races to be held by the association.

10. The publication of an "Annual," containing list of members clubs participating, yachts and their details, registration of private colors, addresses, officers and other matter.

12. Allowances to different rigs in mixed rig races.

13. Annual dues to give practical effect to the operations of the

Association

association. 16. Fines and penalties to be administered. 15. Club-house and museum or repository of models, donations and library

16. Distinguishing colors of the Association, their shape and

17. A systematic course of lectures and entertainments conthe A systematic course of recutres and entertrainments cou-ducive to the spread of a taste and knowledge of the science and art of the sport, which may be printed in the "Annual" for the benefit of those residing at a distance.

18. Rules for compiling records of races to be observed by Secretaries of clubs belonging to the Association.

19. Cruising with prizes for seamanship, as explained in Forest

AND STREAM, Feb. 5th.

AND STREAM, Feb. 300.

20. The general interchange of opinion and courtesy, the rights and civillities to be extended to yachts of the Association visiting strange waters, and a yearly banquet when the treasury is full.

21. Application [10] Congress for the simplification of the Royeune and Treasury regulations governing yachts.

We suggest the appointment of one or more committees to consider the more important and pressing of these subjects, and the turning over to a special committee of all that is left, with

the turning over to a special committee of all that is left, with instructions to report upon what additional legislation they deem desirable to incorporate in the Association rules, besides devising the means to accomplish what they recommend. This will avoid confusion and delay at the meeting. In conclusion, we remind the delegates to the first general meeting, which is to take place March 184, as ancounced, that many conflicting interests and ideas will be represented, and that it will be the duty of each delegate to overlook to some extent personal preferences and hobbies, so that out of chaos order may come. In the end all age to be concentratiated and will benefit personal preferences and monoises, so that out to tenaso the may come. In the end all are to be comparatulated and will benefit affile from united action, and even though some influence may unfully preponderate at the outset through oversight or want of experience in common, everything is sure to find it as proper level in flue, and what cannot be accomplished to-day can be finished

or recinients-morrow.

Dolegates unable to attend in person should be represented by proxy. Nothing will be final at the first meet-log, until placed before each club for consideration and approval. The meeting stands in no wise committed to anything which has appeared in these columns, but is free to act according to its own choice upon all points.

ACTION OF THE S. F. Y. C.

DELOW we append a copy of a letter received by the Secretary Below weappeara cryp or a retter received by the secretary of the Committee on National Yachtling Association from the S.F. V. C., and which is here published as an example of the approval the formation of a National Association meets with or the Pacific Coast, and which illustrates the liberal spirit of the chtsmen, and their generous and willing support of a movement initiated for the advancement of all parts of the

SAN FRANCISCO, Cal., Feb. 14th.

MR. JOHN PRICK, Secretary National Yachting Association:
DEAR Shit: Thave the boner to inform you that the following delocates have been appointed by the San Francisco Yacht Clubtentiend to natures connected with the National Association:
Ex-Commodore R. L. Ogden (yawl Mich, at present at No. 51 Broad Street, New York: J. Clem Ulbler (yawl Emid), at present at Lebanon, Pa., and Charles G. Yale (yawl Enid), 202 Sansome treet, San Francisco. street, New York: J. Clein Unior Guart Internal, at present a Lebanon, Pa., and Charles G. Yalo (yawl Enid), 202 Sansom treet, San Francisco. The San Francisco Yucht Club will heartlly indorse any move

ment calculated to put the yachting interests of America on their
n oper footing. Although at a great distance from the yachting poer footing. Although at a great distance from the yachting center of the United States, and, to a certain extent, isolated, we feel none the less interested in all which shall promote the gen-

eral welfare of our favorite pastime.

The yachtsman's road between New York waters and those of

San Francisco Bay, although the length of two oceans, has already een traversed by one of your yachts, and we hope some day to cturn the visit in a vessel of Pacific build.

Although debarred, from force of circumstances, from social companions used from toron of crountenances, rrom some companionship with the fraternity in the East, we hope, through the new Association, to see established a community of interests which shall result in a closer relationship between yachtsmen in different parts of the country. So far as we can assist in accom-plishing that so object in any way, the Association can command us.

Let me add that you can assure a hearty welcome to all members of clubs belonging to the Association who may at any time come to our shores. If they will be kind enough to make themselves known as yachtsmen to any of us, they will be made free of the club-louse, and may, on any of our yachts, "we their jackets" with the suray of the Pacific

Respectfully,

See'y San Francisco Yacht Club.

YACHTING NEWS.

ROYAL NOVA SCOTIA YACHT SQUADRON .- The annual meeting was held on Thursday, Feb. 12th, Lieut, E. R. Hussey, R.E., Viec-Commodore, presiding. The annual report of the Committee of Management was read by the Hon. Secretary. It congratulates the Squadron on the large increase of membership and of yachts, the squanton on the large interests of memorship min of years, the flow numbering thirty-eight vessels. The Squadron has justly carried the fittle of "the rateing club of America." bestowed upon it by FORENT AND STREAM.—having in each of the past two years sailed more 'races' timn any other club in America. In 1878 the number of , races sailed was ten, with forty-eight starters; and in 1879 the number rose to eleven, with sixty-eigh carties and fifty-eight starters. The number of pri grew in proportion, nineteen being won in 1879 to sixteen in 1: Of these prizes twelve were given by the Squadron, one by May Tobin, two by the officers R. A. and R. L., who repeated th handsome gifts of 1878, and the remainder by the officers of the The prizes were won as follows :-

| | | | | | | |

r the coming season His Honor Lieutenant-Governor Archi

bald has kindly offered a cup to be sailed for.

The Hon. Treasurer's accounts were, as usual, referred to the unittee of Management for audit, and the discussion Commutee of management for adait, and the discussion of quitions proceeded with. A resolution proposed by the Hon. Setary to after the present rule of measurement was voted on yacht owners, and negatived, whereupon the mover gave notic of a resolution, to be brought forward at the next, general, meet of a resolution, to be original toward at the lexit general index ing-providing that in the case of yaelits with immersed counter the whole length of immersion shall be added to the mean length on keel and between the pendiculars for the calculation of the tonnage. The rule governing flying starts was amended by enacting that in all class races no time shall be allowed for differ cracing that in the class alocs to the same beautiful and encoded in the case of start, and that in open races the difference of time at the start up to five minutes; shall be allowed for in calculating the time allowance, but any greatercossing the line after the expiration of five minutes from the starting gun—shall be disqualipiration of live minutes from the starting gun shall be disquan-fied. A motion to allow schooners to cater in united races at three-fifths their real tonnage, and to give and receive timed-lowance on their reduced rate, was, after being amended by al-lowing yawls to enter at four-fifths their real tonnage, carried on allysion. W. F. S. West gave notice that at the next meeting he would move that this be rescinded. The Hon, Secretary yaw. otice that he would move a resolution defining the status of th notice that he would move a resolution defining the status of the officer of the day in charge of a race. The election of officers and committees for the current year was then proceeded with by balloi, with the exception of the Commodore, Ities Excellency the Maryulis of Lorne, K.T., G.C.M.G. Governer-General of Canada; Vice-Commodore, Lieur. E. R. Hussey, R. E., Hear-Commodore, F. C. Samichrast; Hon. Secretary, F. C. Sumichrast; Hon. Secretary, F. C. Sumichrast; Assistont Secretary and Hon. Treasurer, W. H. Troup. Committee of Manageoment: The Flag Officers and Hon. Treasurer, or alpeio; J. Cronan, S. A. White, J. W. Stairs L. Butler, F. S. West. Sailing Committee: The Flag Officers and Hon. Treasurer, et affeto; F. M. Passon, Libert, G. C. Carter, R. E. W. H. Recoldeld, W. Heldey, L. Briand. Measurers; J. E. Buffer G. H. Luke. The fixtures for the season of 1880 will be announced at the general meeting in April.

THREE MORE CUTTERS .- The little iron schooner Ida, 18ft, water line, which has cruised several thousand miles along the coast. has been bought by Mr. Fagan, of this city, and will be altered into nas ocen buight by 3th rugan, or this cryvain with section and a cutter. She may be termed a white-boat model of large displacement and deep druft, having 6ft, beam and 2ft, 6in, water We have also just hinished the design of a 6-tonner for a Canadian grentleman, and an 3-tonner is to be laid down immediately for New York owners.

OUR YACHT BUILDERS .- Scarcely a week has passed of late bu that it has been our agreeable task to call attention to some fres rmatt mist new our agreements of yacht-builders and others in accession to the advertisements of yacht-builders and others in the trade. The support given by the business community to this Journal is the best proof of its extended and very rapidly growing circulation. And well they may take advantage of our lead, for this journal enjoys a virtual monopoly of the rachting interests this jointhat (1905) a frictia hoofpoly or Jacobs, designed of America, having driven all rival flags from the sea. Our circulation among the yachting community is larger than that of all other publications combined, taken several times over, and we have among this one class alone more readers than the entire circulation of the publication of the public culation of many a minor contemporary devoted to the stable of to the retailing of Tongshoreman's yarms. We deem it but a duty to advertisers to warn them against the false representations or sundry little sheets which do not hesitate to seek trade at the exense of truth. There is a wide margin between the varication in an advertisement of "a million and a half copie and the reality of a petty circulation of not muc over five hundred, if that many. Sheets which have to resert to such palpable falsehood to secure even the recognition of their existence cannot offer much inducement to advertisers, and o this we have the testimony of those who were beguiled mussives of the schemers. This week we call attention to the eard of Mr. Samuel Ayers, yacht-builder, who has the best facilities in hisshop for any class of work. Besides a number of small craft he has about completed a 457L sloop, of which we may give further particulars.

ITEMS FROM THE PACIFIC. - The sloop Nellic, Mr. Hyde P. Box has been in commission all winter in San Francisco. A new 53-ft. launch will be built in the same city, and the Fictcher's receiving a new cabin. The schooner Pearl, built by Captain Turner, is for sale; likevi h Sappho, the yaw! Twist, of Benicia, and the a new cabin, sale; likewi

sloop Flint, and Stone's new craft. It is also reported that the setwoner J. C. Consins has been sold to C. O'Conner and may be put into the trade. Mr. McDonaugh, her former owner, will build a new craft, also the owner of the Suppho.

Two Big Graer,—Mr. Sears, of Boston, formerly owner of Wanward, is having a new schooner built down East, said to be 110 ft. long; and Sam Pine, of Greenpoint, has contracted to build a steam yacht, 532k, for Mr. Hinds, of Brooklyn; engines, 10x10, by Rowland, of Norwalk, Conn.

SEAWANHARA YACHT CLUB.-The annual dinner of the at Delmonico's last Friday was participated in by a number of guests representing other prominent clubs. The best of feeling prevailed, and at a late bour, when all hands squared as home, the hospitality of the club was fully appreciated.

YACHT FOR SALE.-In another column will be found the notice a 25-ft keel yacht for sale. She is just the craft for extended uising and can be purchased at a great bargain, fully fitted.

Chuising in Chaler Bay. . . . It was blowing fresh, very fresh, from north, and as we got abreast of Meagher's Reach Light, told Millett, foremast Juck, houdded, in the direction of a "smoker," traveling rapidly toward the yacht. Then was the time to shorten said, but we were not wise in time, famphas no time to state the state at we were not user in line, inny-ing that she would drag what she could not carry. With cabin doors wide open to the cockpit, who do mainsail, foresail, jib and utizen on her, we let be re take it. When! the next second we wondered whether we had gone to the bottom without knowing wondered was all over us, pouring inc occlept and calin con-grambin. Down help the property of the content and calin con-grambin. Down help the property of the property of the property of blow of the tempers, but he become because it is a superior of the property of the blow of the tempers, but he is one because of the time to the property of the pump like old boots to free her, as she wallowed in the trough of Hard up the helm, let her pay off, and run her fill is very superfluous mass of liquid; and let us that the sea. Hard up the belm, let her pay off, and run her fill we get rid of this very superfluous mass of liquid; and let us thank our stars the Nynaphera is deep and carries her ballast low down. Where would your famed shallow model be now? Ugh! unpleasant to think of. I can't swim a stroke, and if I were as good as Webb I should have no chance with this lee-roing tide. All right, skipper; keep her on her course again. And so we beat up under headsail and mizzen and caval into Purcell's Cove.

A word about the yacht. She measures 22tt, over all, 29tt, on the water-line; has a beam of 9ft, 6in, and draws 5ft, aft. She is rigged with a pole mainway. rigged with a pole mainmast, a standing howspit and a caff mizzer; notquite the right thing. I know; so does her owner, blr. C. E. Brown, and he agrees with me, especially since the cruise whereof I write, that a running toquast, running bow. sprit and big mizzen would be improvements. She is too open also for outside work. Her yast cockpit is uncommonly comfortand for outside with. Het visc cookin is greateningly comfort-able in landlocked waters; but, oh, ye gods and little lishes, singlis, it a mistake in open water! There were days, and worse, nights, in the course of our wanderings when every mun aboard heartly wished she were flush-decked, and that she shall be when she wished she were dush-decked, and that she shall be when she again ventures out along the coast. But her cabin is pleasant and song, and in the weather the disadvantages of the cockpit are not apparent; while its convenience is undoubted, the punt ditting in nicely and being out of the way when sailing. Cape George was our furthest point on the way; no wind to speak of, but luckily a strong tide, which swept us up to the breakwater undor-the cape, where, as the tide turned, we deemed it prudent to remain. It was very prefly country all round, and quite enjoy, sale. A similar experience on the Tucsaly; what a shade stronger and fair, and we gibled past Pictou Hurbor, intending to go inside the island and have a look at the town, but that would have in the island and have a look at the town, but that would have involved a pull against wind and tide, and there was too much of the latter and not enough of the former to risk the best. We rested content with speaking the pilot-boat and sending a tele-gram to our friends at home to apprize them of our safe progress. gram came pitch-boat, by the way, had had a lesson about yacits and thou yacits and thou yacits and thous speed which I fancy lice ceve will not soon forget. The damping speed which wondrous pance of her's improved by the substitution of least of the recommendation of the precious motor grams and the substitution of least or loss, a good part of the precious motor grams and the substitution of least or loss and the precious motor grams. very fresh, and her owner, yielding to the wishes of his guests, determined to make for Picton Hurbor. Up went the signal for a pilot, and shortly afterward the pilot schooner tacked to fetch the yacht. Somehow, instead of ranging just ahead of her, the Picton fellows found themselves about a mile astern, nor was it till the "Interior was hove to that they were able to fetch up to her, "Sure pour a a steamer," says Pilot Macdonald, as he stepped on board, to the General. And if took a little while to convince him that the victor of 1951 was not a tea-kettle.—Rouge Urale in Hund's Magazine. very fresh, and her owner, yielding to the wishes of his guests determined to make for Pictou Harbor. Up went the signal for

THE CARIN LOCKER,-To Preserve Sails: Nothing will remove The Cattle Bookst. "In 17 to 18 less on Norming will remove mildow. Serub with Castle scap," sprinkle with diluted lines water, dry in the sun. But the best plun is to treat all new suits as follows, and thereby prevent mildow: Disselve in It gallons of water 1 pound of finely powdered slum, and 2 ownees of finely powdered slugar of lead; when thoroughly disselved, steep the products sign or that the solution will periodic every part ault to be prepared so that the solution will periodic every part of the same for ten hours. Afferd drying, it will be ready for use For heavy canvas, increase the amount of alum and sugar of lead. Jabiher Coxent for Menting Hard Rubber: Fuse together equal parts of gutta-percia and genuine sephaltum; apply hot to the slit or joint, closing same with pressure. Strength of Hirels: shearing strength of a 1-inch rivet, passing threes, is ten tons; and the double shearing strength of plates, is ten tons; and the double shearing strong rivet, passing through three plates, is eighteen tons. for a 1-inch rivet, single shear, eighteen tons; double shear, thirty-two tons, Paliny of Steamers; In the recursing Queen, 490 feet long, the garboards are ,-inch thick, sides \(\epsilon\) inch, with the strakes at beam-ends doubled.

MARINE ART IN WATER COLORS.

Editor Forest and Stream :-

Editor Forest and Stream:—

To the Academy of Design, where the annual exhibition of water color paintings is at present to be seen, I wentnot long ago, specially to view the matine display. Not with the eyes of a professional critic or artist, but simply with a yachtsman's eyes, and I write them up for down) with a yachtsman's pen, a pen which will prove, I trust, to be as quick to recognize artistic excellence and technical merit as ready to notice faults.

In the North Koom we have:

No. 25, "Morning on the Shore," by C. M. Dewey, which is a blessing tecture, well drawn, well waiter.

No. 25. "Morning on the Shore," by C. M. Dowey, which is a pleasing picture, well drawn, well painted, natural and dewy, as it should be in the morning.

Nos. 35 and 58 are scenes on the Rhine and Scheldt, by Samuel Colman. Not up to his high-water mark. Water and sails indicate a calm; snoke and pennant call for a breeze—"at most amusing paradox." Dutch sails ulways seem to be ridiculously disproportionate to size of boats,

Remind me of story about W. R. Travers. Travers hired Mr. Hatch's yacht for the season, with crew aboard. Found that the steward couldn't make a cocktail, Mr. H. having run a temperance yacht, and 'n over carried any whiskey, sir." "Well," said Mr. T., "you'll have to learn to make it. Wo sometimes carry more sail than whiskey, and sometimes we carry more whiskey than sail; but we never hoist more than we can carry of either one. Don't be afraid,"

No. 56, by Fred S. Cozzens, represents a paddle-wheel coasting steamer making her way at half stroke through floating ire, in a snow storm. Excepting a slight suddenness of shading on the starboard bow, she appears to me to look remarkably like a coasting steamer making her way through floating ice in a snow storm.

No. 75 is a characteristic sketch of DeHaas, showing a rough-looking schooner on the starboard tack under three lower sails. Execution bold and toney, but the drawing of fore and mainsail leaches is decidedly faulty. Sorry to see none of A. Cary Smith's here. His outlines are always right.

There is a lovely bit of surf and shore in this room by Wm. Huston (103), but "skyed" outrageously by the committee. Nor it hangs a quiet but effective twilight

always right.

There is a lovely bit of surf and shore in this room by Wm. Huston (103), but "skyed" outrageously by the committee. Near it hangs a quiet but effective twilight seens on the Thames, by Geo. Hitchcock. Reminds one of some of Dickens' descriptions of the London docks. The old dismantled hulks are wonderfully hulky, but their shrouldess masts are vilely stepped.

The best marine in the room, by all odds, is No. 113, by H. P. Smith, and as good as any marine in water color

H. P. Smith, and as good as any marine in water color need be. Water, rock, cloud, gull, yacht, each is sati generis. "A group of boats," by Reinhart, (135) is nicely drawn and boildly treated, but rather unnatural in coloring, which however is somewhat harmonized by

distance. Passing into the East Room the first picture to deserve

Passing into the East Room the first picture to deserve attention is 143, by Henry Farrer. Inever saw the moon rise on the East River, but doubtless it is as Mr. F. has depicted it. Nor did I ever see a bark with masts in one singlestick from keel to trucks, and I don't believe he did either. But the picture is a pretty one, though not so pleasing as Nos. 268 and 316 by the same artist. No. 221, "The Wreck," by R. F. Bloodgood, although unpreclentions, is enough to show that the artist can draw a boat and colorit. The effect is not marred, moveover, by the usual stock properties in the way of anchors buoys, cables and other articles, which would certainly have been long since appropriated by the regulation wrecker in the red shirt, who is generally to be observed busily engaged in doing nothing whatever, while ple-

thoric seagulls hover fearlessly around. For having spaxed us those the artist has our thanks,

No. 242 is a very creditable contribution by D. M. Bunker, representing a small opyster-sloop moored to the meadow bank at low tide. The sail lacks texture, to be sure, but the drawing and foreshortening are so correct that it is scarcely worth mentioning. It is oridently an out-door study and not mere studio work, barring, perhaps, the mainshect traveler, which should run over instead of under the tiller—an arrangement which is very unhandy in tacking and dangerous in jibing.

In the West Room we find another gen of Huston's in the 'Wreck on Long Island Coast,' and not far off another wreck-piece, called "The Morning After" (293, by J. Thorpe). A better name would have been "The Following Year," for the wreck is altogether too weatherbeaten for one but twelve hours old. But it is well handled, and the clouds are better than usual.

"David and Goliath' (297, by E. W. McDowell)—a small tng towing a large vessel, with a very black hawser, by the way—is stiff and amateurish, but above the average in tone and coloring, though these will not redeem defective drawing. I shall look for something better next year.

"Morning off the Isle of Shoals" is the name

in tone and coloring, though these will not redeem defective drawing. I shall look for something better next year.

"Morning off the Isle of Shoals" is the name of a carefully studied composition by Mr. Cozzens (No. 323), and no loss carefully painted. A group of sloops and schooners in the doldrums, the sails idly flapping to and fro, with reef-points slatting, booms creaking, and the sun struggling through the yellow mist—all these are not easy to transfer to apper. But Mr. Cozzens has done this with rare success. His work shows much improvement over last year's; but as he is quite a young artist that is to be expected. His weakness may lie in his shading, but his sails are canvas, and his ships float in water, not in paint.

No. 316, by F. A. Silva, coversa good deal of paper, and distance does that salve float in water, not in paint.

No. and his ships float in water, not in paint.

No. which, though dropped, is already higher than the springstay, while the port main shrouds are over the forward crosstree at the masthead. Like those of Mr. Farrer, his masts and topmasts seem to be all of a piece. In his "Connecticut Shore" (210) the same inattention to trifling cessentials is observable in the unmatural hanging of the lazy jacks of the inevitable big sloops in the middle ground, which otherwise is very good.

Mr. Symington's "Morning on the Lake" (363) is good though rather hard and cold, but much better than his "Young Fisherman" in the North Room. Neither can be strictly called marines, however, though boats and water enter into both.

A pretty drawing by F.H. Smith, in the corridor, called "Noon. Seabright." is worth more than a glance, but is scarcely a marine, so I pass on to No. 638. "A Bit of South Cove. N. J." which one may recognize from afar off as the work of Henry Muhrman, the "impression'st." The "impression" it produced on my was—well, it looks like a lot of boats, bridges and buildings as they might appear after an earth, quake, dynamite explosion and tidal wave which, having subsided, has left things pretty badly mixed. But perhaps the paints got mixed, or it is hung side up. However, it is arristic and bold, very bold. A triple "Study of Boats," 648. by G. Reynofds, deserves a better place than a dark corner. They are very eleverly drawn and painted.

No. 634 is a breezy drawing (in chalk and crayon, I think) by S. G. W. Benjamin, full of marine spirit and correct, except perhaps the position of sloop's mast.

"Homeward Bound" (709), by J. G. Brown, in black and white, is the best example of its kind in the building. Strengthy, clear and true to reality. The old boatman is a boatman, and his boat is fairly flying over the waves, though I observe with regret that she carries a leeward helm.

The Black and White Room contains but few drawings

olm.

The Black and White Room contains but few drawings to the properly be mentioned here. But Nos. 371 and The Black and White Room contains but few drawings that can properly be mentioned here. But Nos. 371 and 391, by Farrer, will serve as examples of an all too conmon error—namely, that of leading shrouds too far forward on the side of the vessel which is away from the spectator. The result is that the vessel and her rigging give each other the lie, whereas the artist ought to father it.

Trout fishermen will thank me for calling their attention to a little Adirondack gem, 257, by John Johnson.

J. L. K.

-- It looks as if the ground hog prediction might be fulfilled after all. The old prophecy on which this faith is founded has a much more substantial basis of authenticity than the spurious rhymes of Mother Shipton, and is as follows :--

10110048;—
If ye wudd-chukke seez hys shaddo ian ye sunne,
Six wokes of wynterre sholl have begunne;
If ye wudde-chukke hys shaddow doe nott see, Six wokes of sprynge like weather thayr shall be.

Forest and Stream and Rod and

A SWE do not employ any authorized agents or canvassers, we offer our friends in every locality who will give any time or attention to collecting and forwarding subscriptions, the following inducements to obtain subscribers for the "FOREST AND STREAM" at the rates and commissions given below:

Collect Subscription price, 3 months, \$1.00 Commission to be retained. 3 ".25 6 months, \$2.00 1 " \$3.00 \$8.00 Amount to remit us, 3 .75 \$1.50

Condition to the above Commissions, we offer the following CASH PREMIUMS:

To the person sending us the largest amount of money obtained from new subscribers, whose names are not now on our books, at above net rates, between January to the person sending us the largest amount of money obtained from new subscribers, 1, 1880, and July 1, 1880, —
To the one sending the next largest amount, in accordance with the above conditions, To the third on the list, \$100.00 And to the fourth, Sample Copy, Subscription Blanks and a handsome Show Card (to be posted in a conspicuous place) sent free on application.

Subscriptions may begin at any time during the year, and may run any length of time, but no subscription will be entered on our books until the money for the same

has been received at this office.

No commission will be allowed on the first SINGLE subscription, but the commission due on the first two subscriptions may be deducted from the second, and thereafter the commission can be retained on each succeeding subscription. You are sure of the commission which you retain, and also have an equal chance to get from \$25 to \$100 of the cash premiums in six months.

To any Person sending us before July 1, 1880, two new subscribers for one year, or four new subscribers for six Months, and Eight Dollars Cash, we will send, in place of commission, any one of the following Articles:

Jordan's Manual of Vertebrates.

A copy of Fourest AND STREAM for one year.

A three-plece double-fermic lancewood tip, full mounted, polished lakes, Trout or Bait Rod.

Cone Fishing Outfit, consisting of Rod, Reel, Line, Snells and Hooks.

One Russia-leather Fly-book, and one dozen assorted Flics.

One five-feet lancewood Bow, Horn Tips, and one dozen 23-inch Arrows.
One pair Club Skates.

To any Person sending us, before July, 1880, Sixteen Dollars eash, and Four New Subscribers for One Year, or Eight new subscribers for six months, we will send, in place of commission, any of the following Articles:

Two copies of Forest and Stream for one Year.

A four-piece, double ferule, guides and reel-band, hollow, butt, extra tip, full mounted, Bait or Brass Rod.
One 3-piece do, Fly Rod.

or flies and snells.

One full-length Fly Book, and two dozen assorted Flies. Coues' Key to North American Birds.

A good Fishing Outfit, consisting of rod, reel, line, hooks | One Gent's six-foot self*lancewood Bow, made to weight, and one dozen half-notched polished Arrows,

One Set Parlor Archery, complete in box. One pair nickled-plated Club Skates.

One Parlor Air-Gun.

Write your name and the name of the person to whom the paper is to be mailed, plainly, and do not forget POST OFFICE ADDRESS, TOWN AND STATE.

Remit, if possible, by postal money order, check, or draft on New York, payable to order of Forest and Stream Publishing Company. If neither money order nor draft can be obtained, inclose money in Registered Letter. Addresss

HAVE entertained the idea of writing down, for the benefit of my fellow sportsmen, something about The game and fish of this region. The imaginary person I represent, belonging as the does to one of the oldest, most respectable, and aristocratic families of the State respectable for their virtues, eminent for their abilities and venerable for their antiquity, naturally takes great delight in anything that redounds to the past, present, or prospective glory of the Commonwealth. He takes great pleasure, therefore, in giving you some account of the game and fish resources of his native heath, which, though gradually diminishing from indiscriminate slaughter and no protection, are still more considerable than in any other part of the Union with which he is acquainted.

Since the publication of "Travels in Arkansas" by the English naturalist, Nuttall, and the humorous sketches of Col. T. B. Thorps and "Peter Whetstone"-long since out of print-no extended account of Arkansas has appeared in general circulation. The limits of one letter would hardly be sufficient for this purpose, even if the interest would justify. To be brief, then, the game of this State may be divided into two classes, the same as the population; local and migratory—old citizens and carpet baggers: no offente toward that worthy class of our fel low-citizens is here intended. The migratory portion of the game may be subdivided into such as come to stay all winter, and such as merely pass us on their long spring and fall journey. To the former subdivision belong many of the ducks, to the latter the geese. Most of our local game is semi-migratory, that is, it moves about and changes location accordingly as the mast hits or misses always keeping an eye to the main chance, passing from upland to bottomland, from open woods to canebrake, as the food supply requires. It always happens when either deer, bear, or turkey are unusually plenty in any locality, the others will not be far away. Your correspondent is Your correspondent is exceptionally fortunate in living on the border land between the low and hill country, from whence it is easy to go to either, and where the opportunities for accurately locating the best hunting grounds are unusually good. But more of this under the appropriate head. Arkansas has an area of more than 50,000 square miles and a population of less than half a million-less than ten to the square mile, rather unequally distributed in town and

country—the towns far outnumbering the country districts in the natter of growth. The State, for the purposes of a brief account of its game resources, may be divided into four sections: the Northeast, Northwest, Southwest, and Southeast, each possessing distinctive characteristics.

divided into four sections: the Northeast, Northwest, Southwest, and Southeast, each possessing distinctive characteristics.

The northeast portion of the State extends southward to White River and westward to Black River, and borders on the State of Missouri and the Mississippi River. It is, as a rule, low and swampy, possessing heavy timber and heavy cancbrakes. The "sunk lands" constitute a considerable portion of this part of the State. It is traversed by innumerable sloughs and has many lagoons and express swamps. There is a range of low hills running through it, known as Crowley's Ridge. The general direction of the ridge is from northwest to southeast; it terminates at Helena on the Mississippi River. The principal rivers other than those named, are St. Francis. L'Auguille—pronounced "Laugell"—Bayou de View, and Cache, all suggish, chocolate-colored streams, mere ribbons in dry weather, immense floods when up. These streams and their tributaries, as well as the lakes, or lagoons, are well stocked with black bass, pickerel, all sorts of perch, and such coarse fish as drum, buffalo, and cat an ansenm. As might be inferred, this wast region is alive with game, and owing to the inaccessibility of a portion of it in the winter and spring months, serves as a sort of a game preserve. It is more sparsely populated than other portions of the State. Deer and bear abound, and it is not long since clk were known to exist in the vicinity of the sunk lands. There are large areas of fertile land, clevated just above the regions of eternal wet, and these are the sites of such settlements as have been made. By the use of light boats nearly the whole of this region might be traversed. That it is capable of yielding the finest of sport may readily be inferred. In the lafe fall and winter months countless millions of ducks and goes literally cover the waters. The far-famed Swan Lake is situated in this section. In the western part of this region the proportion of dry land grows greater. Here deer, bear, and turkeys are foun

"the, Guyon, must be grown out; he don't fluth nothin' but birds, and don't keep no dogs but these settin' pointers."

Thad almost forgotten to mention Rob White. He is here with his cheering note, not in great abundance, but sufficient for royal sport. Snipe and plover are plentiful at times, but don't tarry long. There are a great many fur-bearing animals throughout the entire region. Swans and geese tarry awhile—sometimes all winter. A full and detailed description of this quarter of, the State would make any letter too long.

Northwest Arkansae extends from Black River westward to the Indian Territory. Immediately on emerging from Black River bottom, going west, one comes to upland, then hills, then mountains, The surface is diversified, however, and there is some prairie. Water for a constituent of the surface of the country is better settled. There is, however, and to course abundance of game. In seasons when the mast fails in the lowlands and "hits" in the hills, deer, bears and turkeys are found here without trouble. The streams are rapid and clear, and fishing bears a closer resemblance to sport. Black bass, jack salmon, striped bass, jickered and all sorts of perch are found. There being more small grains raised than in other parts of the State, quail are consequently more abundant.

Southwest Arkansas lies between the Arkansas River and the Louisiana line, extending far enough east to embrace the town of Hot Springs. It is mountainous in places, but has also some water fow!. The fishing is reported not so good as in other parts of the State. There are, however, localities that form an exception to the general rule.

are, nowever, locatues that form an exception to the general rule.

The southeast part of the State lies south and east of Little Rock, having Lower White River for its northern boundary. It abounds in quail, turkeys, deer, bear, and has a fair supply of water fowl. It has immense cane-brakes and some extensive prairies. On the latter is to be found as good prairie chicken shooting as the United States affords. The area, however, is limited to the two counties of Prairie and Arkansas. Here are also sand-little ranes. Plover and snipe in countless millions in their season visit these prairies. In the river bottoms close to these prairies are immense canebrakes, where deer and bear may be found in—I had almost said—unidininished numbers. At Crockett's Bluff, on Lower White River, right in the very hidst of all these good things, lives that prince of Arkansas sportsmen and good fellows, Col. Bob Crockett, not a rough and burly back-

woodsman, but a "sure-enough" gentleman sportsman, of good address and polished manners. Col. Bob is a man of fine ability, full of anecdote, well informed, and wields a facile pen. He delights in field sports and engages in them without stint when his professional engagements do not interfere. If he could be drawn out he could "a tale unfold" about Arkansas that would cause all other tales to seek obscurity. He was here in the halcyon days "befol the wah."

do not interfere. If he could be trawn out he centh "a tale unfold" about Arkansas that would cause all other tales to seek obscurity. He was here in the halogen dayabefol the wah."

It will be observed that in speaking of fish I have not said "trout" once. This is because the speckled trout (S fontindis), is not found in Arkansas, nor is the ruffed grouse. The absence of these daintiest of the dainty among fishes and birds, is a sad deprivation to one reared in their haunts, and it takes a very long time—how long I do not know—to conquer the "hankering" after them. Not even the eloquent and persuasive article of your able Kentucky correspondent has been sufficient to render me forgetful of my first love of the mountain stream, or to make me altogether strisfied with the black bass. Whilf am sincere in my admiration of the game qualities of the bass, still from putting together the rol to the "grace after meat," I can see nothing to entitle him to the misapplied name of trout. Then the surroundings of their respective dwelling places, the clearness of the water, the purity of the air, the grandeur of the scenery—there, is no comparison. The truth is, that in the South and a great part of the West, the black bass is "the best Bill can do," and that is the whole story. But here the venerable Governor, whom I represent, feels called upon by his regard for his name and fame and the traditions of his family to reassert himself, I lew vishes it to be distinctly understood that what his native State may lack in quality, she makes up, and more too, in the quantity of the graze she possesses. Besides the black bass, mylnow, is no "slouch," and the wild turkey no "food hern" be be filled by any novice just because he wants to. To an unstincted abundance of game which by judicions legislation is capable of being fostered and preserved, or even increased to any destrable extent, may be added a winner climate as near perfect as any in the Union—just cole enough to have been after them of the water, and contained and the rem party or creed, of 1. more at home. Jacksonport, Ark.

REEL FOOT LAKE.

Musing upon the shore I said,
"Oh, take and waters blue,
"Its time to shoot the gay green-head,
And the sad wild goose, too."

ACTER SOME FELLOW WHO WAS AFTER TENNYROW.

AVING been prevented by the prevalence of yellow fever in Memphis, and the consequent quantum restrictions, from going to Grand Prairie, Ark, after plunated grouse, for two seasons in succession, we determined to try Reel Foot Lake this season for ducks. Consequently on election day, after having duly deposited our votes, we boarded the north-bound train on the Mobile and Ohio Railroad. Our party consisted of Col. Y., Watter C., Gray F., Forney G., and the chronicler of these records.

It was a clear, stiil day, cool and bracing; a good road and splendid cars, and plunging through receding woodlands bright and glorious with the many thus of autumnal foliage; through cotton fields, white with the fleecy staple; through cotton fields, seria and naked;

road and splendad cars, and punging through recently woodlands bright and glorious with the many thits of autumnal foliage; through cotton fields, seri and naked; through blue cuts and red cuts; over trestles, and across long reaches of swamp lands, we reached Union City, Tenn., at nightfall. Here we left the train, and having dispatched ahead, found a good square med awaiting us. From this point the lake is distant eighteen miles—according to the reckoning of the inhabitants—by our count, at least twenty-five.

A bargain was soon struck with a liverynam to be on hand at daylight with a conveyance to take us to the lake. We consumed the time after supper, until It o'clock, loading shells; and it is the next thing to a miracle that the roof was not blown off the Planters' or whatever is the name of the hotel. However, we got through safely; and the Colonel and I having been assigned to one room and one bed, rolled in together; and just as we had got comfortably straightened out, down on the lightened out, down can be the five-clotlar bedstead—a most fearful and irrreparable wrock. I am satisfied they thought below

stairs-from the way they came pouring up-that we had stairs—from the way they came pouring up—that we had bursted a keg of powder. Nothing was left us but to go to another room, where we found two beds, but one with a man in it. So we laid our four hundred pounds of humanity on the remaining one as gently as possible, and were entering the borders of dreamland, when pop went a slat! This necessitated a little novement to get out of the snagged place, when rattle-bang went two or three more. We got up and put them in again, but it was time wasted; for, as soon as we would be down, out they would pop again. In the meantime the man in the other bed was sleeping as soundly as old Rip Van Winkle in Catskill Mountains, and doing some as able-bedied snoring; as one ever listened to. Now, W. intimated, next morning, that I induged in some 'a pupropriate remarks,' and wanted to throw my boots against the door to wake the fellow; but I deny the allegation and denounce the allegator.

and wanted to throw my boots against the door to wake the fellow; but I deny the allegation and denounce the allegator.

The floor was so taken up by a stove, our impedimenta, etc., both under the bed and all around, that we could not find space enough to put down our bed—and as there was no help for it—we had to lie there, doubled up into the shape of a couple of figure 5's, until dawn. I have slept on the battletical, surrounded by the dead and the dying; I have slept in the snow; I have slept on the sodden carth, with a winter's rain benting down upon me; I have slept in the sow; I have slept on the dod a staked and ridered-ferce; I have slept in the sood, I have slept in the special to the staked and ridered-ferce; I have slept in the saddle; I have slept in a bug-iffested bed, in a but in the pine hills, but nowhere and with no surroundings have I ever passed a more miserable night. And still the fellow in the otter bed snored on! "Not poppy, nor lysop, nor mandegora, nor all the drowsy syrups in the world, could ever medicine him into a sounder sleep," it can was on him then.

At the first peep of day we were up, and, having hauled the rest of the party out of bed, we breakfasted by lamplight, deposited ourselves and baggage in a two-horse socialed spring-wagon, and rolled out for the lake.

The road runs past some splendid farms, and through some magnificerity timbered woodlands; indeed, I never saw finer timber anywhere. Some of the poplars and pin-coaks were simply immense. The face of the country is, at first, gently undulating; but as you approach the lake it become more broken. Further on, deep valleys and steep ridges take the places of the gentle rises and late vales. At length, on the summit of one of these hills, five or six niles from the lake, a treshening breeze bore and steep ridges take the places of the gentle rises and steep ridges take the heart; and how instantly and vivite or many the sounds of the far-away skirmish; plainly the gunshote could be heart; and how instantly and vivite or

"When the ranks were rolled in vapor, and the winds were laid with samul."

managed to fish out their guns. These dug-outs are the shaliest concerns, in the way of water craft, that I ever attempted to navigate. They are not much bigger than an old-fashioned plantation bread tray; you have to part your hair in the middle to keep them level—and the least bobble, slap over they go, bottom upward. I would as soon attempt to shoot from the back of a kicking mule as from one of them. At a fish-house on the shore, we procured a guide and struck out for a point about three miles off. Pulling through a narrow ditch we entered the lake. The first view is dismal in the extreme. The water is covered with a brownish green seum, the floating seeds of the long moss that grows in the soft ooze in the bottom, stalks of the lotus, or water lily, with their umbrella-shaped leaves, dead and sere, lift themselves above the brown seum, weird and ghost-like, and rustle and shiver with every passing breeze. On either hand, far as the eye can reach, stand the branchless trunks of gigantic cypresses, bleached and worn by the sunshine and tempests of nearly seventy years. It is a scene of utter desolation and impresses you at once with the conviction that some sudden and uvful convulsion of nature hollowed out this dreary waste of water. Long ago—as long as the Good Book allots the years of the life of man—these blanched and fire-scarred trunks lifted their heads, green with their feathery foliage, to the light and air of Heaven. The shock of the earthquake came, the ground was upheaved near the river and depressed further back. The water in Ree Foot Creek, finding no outlet, gradually filled the vast depression. The trees died, and their bleached skeletons stand and will stand until the next generation shall have passed away, silent witnesses of that fearful convulsion. The lake is some eighteen or twenty miles long, and from one to four miles wide. Where we were the water was at no place over twenty feet deep. Towards the centre of the lake the water is clear and of a slightly bluish color, the reflection of

**.*=" Oft from out it leaps The fluny darter with the glittering scales, Who dwolls and rovels in thy glassy deeps, While chance some scattered water-lify sulls Down where the shallower wave still tells its babbling tales."

The water-lily, or lotus, grows in all the shallows. The water-lily, or lettus, grows in all the shallows. It has a seed-pod shaped some what like an inverted wasy's nest; containing from one to two dozen utis, very much like a small acorn and as hard as iron. After these nuts the ducks come, according to some; others swear a duck nover eats them. A friend, who has shot them for years, told me he had opened hundreds of ducks of all kinds, and had never found a single yonquapin in one of them. But whether they eat them or not, the ducks come there in myriads. The navigation of this lake in a dug-out is not the easiest thing in the world. Thousands of stumps stand just far enough below the surface of the water, invisible in the moss, to strike your boat. They are as slick

the first Manuseas, at Shiloff, at Perry-tile, in Martrees box of, at Chickmanuga, at Franklin,

"When the make were rolled in vapor, and the winds were laid with sounds. From the residence of the residence of the valor of the state of the

from a tottering dug-out. The fact is, I could shoot only those that came in square from the front, for whenever I fired over the side I was certain the canoe was going over. Well, we made it hot for them until utter dark

over. Well, we made it hot for them until utter darkiness put a stop to our shooting. I never saw anything come in faster, except swallows to a chimney on a summer's eve. "The air was dark with pinions," and rustle of wings and loud splashing as they dropped into the water was continuous. The yonquapins were very high and as thick as the hairs on a dog's back, and it was very dark, so we got only a small per cent, of those shot down, It was late at night when we got back and our boys were just on the point of organizing a party to go in search of us. But perhaps we were not tired and hungry, and the brown eves of the pretty girl opened in astonishment as fish and potatoes, and ducks and pork disappeared beneath the folds of Gray's capacious canvas, and I was not far behind, if I was handicapped with a headache. When we went back to our room we found Walter, Forney and the Colonel piled in bed, boots, hats and all, and as sound asleep as the fellow at Union City, and we were not long in following suit.

The next day Gray and I went back to the point we had occupied the day before; the others went down the lake. Col. W. killed a goose—the only one bagged. For easy rowing we went further from shore, where the water was free from vegetation. It was quite clear, and of an average depth of six feet. I noticed some very singular water tortoise. They were about the size of a common "highland terrapin," iris-hued, with an orange-colored bottom shell. Prodigious numbers of coots kept flapping up before us, but we did not molest them as we were after larger deer. The day was warm and clear, the ducks flying very high. We did not get many shots until late in the afternoon. While I was on my log my friend Major Val. X., of Columbus, Miss., came by with a darkey paddler and a miscellaneous cargo of ducks, coons and minks. The ducks did not come in so thickly as on the previous evening to the roost, and commenced coming in later, so we did not have half the shooting we anticipated. One old mallard came along juy Gray. He cut

Colone and Land the last range A care with re-yelling for "Bob" to bring some water. They put me in the bridal chamber, and all nightlong I was trying vanily to shoot from a tottering dug-out—with a gun that would never fire—the myriads of ducks that cleaved with shadowy and noiseless pinions the boundless air of mysterious dreamland.

"For a mallard Tye winded the marsh, And hunded each pool in the lake, oh! Miss the lake of the lake, oh! Or to doom thee, O duck, Or to doom thee, O drake, three a drace."

Corintle, Miss.

Guyon.

Matural History.

A CORRECTION .- In our remarks on Uniform Nomenclature in our last issue we were made the victim of an unfortunate printer's error, which we desire to correct without loss of time. Referring to the action of the committee on Nomenclature of the Michigan Sportsman's Association, we are made to say: "The views expressed by the committee are founded on the right idea, that of absolutely local names, and substituting the names which belong to the various species and by which they are known to biologists," etc. The sentence, as printed, means, so far as it means anything, the very reverse of what we intended to say. We wrote: "The views expressed by the committee are founded on the right idea, that of abolishing local names," etc. Our readers will set the importance of making this correction,

REMINISCENCES OF MY PET CROW.

Cooper's Point, Feb. 3d.

Editor Forest and Stream :-Having read many very interesting accounts of the sagacity of birds in the FOREST AND STREAM, I am induced to present the following recollections: One afternoon while pushing the marsh I noticed what I at first supposed to be a king rail. As I approached the bird I dis covered it to be a young crow crippled in its port wing. I took it in the skiff and soon forgot the circumstance. On my return to the boat-house, however, the crow re minded me I had left something. I took it home, and with careful nursing he soon became strong and fat, and correspondingly saucy. I was at the time in the wholesale dry goods business at Front and Market streets, Philadelphia, and lived just over the water at Cooper's Point. I invariably crossed the river in a small sailing skiff (barring stormy weather) in the morning, roturning in the evening. "Jim" always accompanied me, and his favorite roost was either at the masthead or on my weather shoulder. A long sand-bar running north from Smith's Island divides the eastern and western channels, termi nating in a bulkhead from the Jersey shore, leaving a small swash passage between, difficult to navigate. Jim had the soundings down fine, and always gave orders to tack ship in pure crow language when we were aptack ship in pure crow tanguage when we were approaching the botton. On one occasion he was resting on my shoulder and watching me intently. The tide being low and the wind ahead I was obliged to make short tacks and maneuver skillfully. Presently a "header" put the skiff ashore on her center-board. In an instant the bird struck me in the face with both wings, and with a shrill derisive cry flew away, evidently disgusted. For a long time he refused to go with me on the water, until one afternoon I was racing with a larger boat, and just as I passed her Jim settled down on my shoulder with delighted approval. We were friends after that.

He never allowed me to let the sail shake along the luff for an instant without making a fuss about it. and onderstood when it was time to jibe over, and always let me know it. His great delight was to see the skiff driven through the heavy seas, though half drowned by the spray. He never seemed quite to understand the utility of reef nettles. When a flock of crows would pass over us Jim generally left me for a few minutes to include in the innocent amusement of making them He was the fleetest bird I ever saw and the most graceful. He was game all the time, but one day king bird chased him into the skiff. He tried hard to make me believe he was unwell, but somehow I never understood it that way. He never entirely got over the mortification, and it was his last battle. He was extremely fond of me, and as I write he seems to look at me approvingly from his perch, though his eyes are glassy now. I was always under the impression that Jim was to the (Jersey) man or born, not so much from his superior intelligence as the peculiar sand-bar color of his wing tips. Delaware passed a law giving five cents per head for every crow killed, I presume on account of his color. As he could not well be put in the stocks or flogged, the next best thing was to cut his head off. The crows naturally sought protection in early morning flights across the water to Jersey, where they fed sump-tuously all day, returning home in the late twilight to Jim had great powers of discrimination, and could tell a foreign crow at long range, and on such ho made terrific slaughter, but the State never "divied." As we have champions for almost overything in these latter days, I would like some time to give you an account of our champion "boat upsetter." A large and handsomely devised silver medal attests his prower

NOTES FROM CORRESPONDENTS .- Our friend, C. M. C. of New City, to whose capture of a king rail with a frog in its throat we referred recently, has sent us a note in regard to the matter giving fuller particulars of the circumstances. He says: The frog was about four inches long when extended, and about one inch in breadth, and was alive when drawn from the bird after it was shot. About one-half an inch of the feet protruded from the bill of the rail....A. F. de N. notifies us of the shooting in the "Pines," of New Jersey, of a ruflled grouse of a bright golden color, and asks if it is not a rara avis. We presume that it is a blanched specimen, or partial albino, though normally colored birds of this species are sometimes very pale.

DRUMMING OF RUPPED GROUSE AT NIGHT IN WINTER.—I am an ardent admirer of the FOREST AND STREAM, and have been recently re-reading the back numbers, in which I have noticed inany articles on the ruffed grouse, but have not seen anything like the following: While encamped on/kegro Mountain, Somerset Co., Pa., Doc. 1st, 1679, I heard ruffed grouse drumming at the hour of midnight. The moon was shining brightly; the ground evered with three inches of snow, and mercury about 13 degs. above zero. This is something very unusual, is it not:

Grouse often drum during the night in spring and fall, but we have nover known of their doing so in the winter. The case you cito is an exceptional one, we imagine,

BIRDS AND MAMMALS INTRODUCED INTO NEW

WE have been favored by the following epitome of a paper on the above subject by H. M. Brower, Hon, see. Wangami Acelimatisation Society, New Zenland, ately read (January 15th) at the Linnavan Society of lately

London.

The author refers to Dr. Buller's volume on the New Zealand Bird-fanna as not written too soon, for the rapid disappearance of many highly interesting forms is to be deplored, to wit, the kakapo (Strinops habroptilus), New Zealand quall (Columba Norce Zealandies), bell bird (An-

Zealand quail (Coturnix Nove Zealaintiv), bell bird (Anthornis melanuru), etc.

But to import English birds to supply their places is not without its difficulties. Native enemies are to be contended with for example, the New Zealand owl (Ninox), it is asserted, wages destructive warfare against the smaller finches and songbirds. Of 100 diamond spirrows liberated on the Island of Kawam by Sir George Grey, few escaped the ravages of this little owl; and on the Hon. Mr. Stafford's grounds at Wellington, a number of insectivorous birds being let loose, these soon attracted a host of owls to the serious discomfuture of the former.

Notwithstanding, finches of various sorts have succeeded, and undoubtedly increased to such an extent that there is now no danger of their extermination. The skylark may even be found enlivening some districts with its cheerful, varied nucie. Of other species acclimatized there may be mentioned starling, thrusis, blackbird, chaffinch, goldfatch, yellowhammer, house and hedge sparrow, Indian mynah, ringdove, golden plover, jay, Australian and Tasananian magpies, Museovy ducks, black and white swans, Californian, Australian, and Madagascar qualis, partridges, pintails, grouse, and pheasants of various sorts, etc.

The pheasant now abounds, and even shooting licenses

quaits, partridges, pintans, grows, and proceedings of the pheasant now abounds, and even shooting liconses are granted. Fifteen birds were turned out in the Wanganui district in 1866. These have now spread all over the province, even far inland. Two friends of the author lately bagged seventy in one day, and this by plain, open shooting.

lately bagged seventy in one day, and this by plani, open shooting.

The China pheasant (? P. torquatus) is most numerous, although the common sort (P. colchiens) is increasing. It is a singular circumstance that on the occurrence of a tremor of the ground from an earthquake the cock pheasants set up a continuous crow either of fear or de-

nance,
In the North Island the partridge (Perdix cinerea)
In the North Island the partridge (Perdix cinerea)
thrives less vigorously than in the South Island; Canterbury especially, with its cereal crops, affording perhaps a
better feeding and breeding ground. The red-legged partridge (Pacadots rufa) is plentiful in the Rangitikei district of the Wellington province, but it appears to remain where first located. Blackbirds and thrushes, and the

where first located. Blackbirds and thrushes, and the Indian mynah (Acridotheres gingintanus) are seen in large numbers in the Nelson province.

Of mammals imported by the societies the following are the chief:—The red, the fallow, the Sambur, and the California deer, Angora goat, have, kangaroos, wallabies, and oppossums. A consignment of thirty-three fallow deer was lately made by Mr. Larkworthy, and of twenty-eight which arrived in safety eighteen were turned out in the Walkato, and ton in the Wangaoui district. On the hills in the neighborhood of Nelson largo herds of wild red deer are reported to have been seen. Fallow deer set free near Richmond layer increased. The author bere

hills in the neighborhood of Nelson large herds of wild red deer are reported to have been seen. Fallow deer set free near Richmond have increased. The author here appeals to the proprietors of English deer-parks for some of those fawns annually killed when it is desirous to procure fat doe venison. Haves have multiplied almost too rapidly, and one peculiar feature is that the female in Now Zealand pronces six or soven instead of two or three at a birth. Already the southern farmers complain of the hare's destructive qualities, and coursing clubs need bi-weekly during the season. Thus from a former patiety of manimalian life in New Zealand there begets a tendency to the contrary, and possibly ore long its fauna will have approximated to that of the Mother Country.—J. MURIE, in Land and Water. Land und Water.

THE HEARING OF FISH.—We printed, some time ago, ome observations on the voice of fish, contributed to Nature by an East Indian correspondent, which seemed to indicate that these animals were capable at least of producing vocal sounds; and recently Mr. Hugh Owen has sent to Land and Water some interesting observations and conclusions of his, which we are sure will be perused with pleasure by most of our readers. He says:

ions and conclusions of his, which we are sure will be perused with pleasure by most of our readers. He says:—
It is exceedingly doubtful if fish possess the faculty of hearing in the ordinary sense of the term. Mr. Buckland has accurately described the nature of the sensation they do possess, as vibration. There cannot be a doubt that fish have no possible conception of either vicinity, direction, or distance of the vibratory disturbances they receive. A distant vibration disturbs a shoul of fish as much as a near one; and fish feeding eagerly at the bait will be alarmed and dispersed by the beat of a steam vessel a mile off. All the stories of fish coming to be fed at the sound of a bell or of a whistle are, of course, fables, Such sounds made in the air will not communicate vibrations to the fish beneath the surface of the water. They assemble only because they see a figure, and are accustomed to be fed upon such occasions.

In trying some experiments on this point, I kept carefully out of sight, and simultaneously discharged the two barrels of a double gun on the bank of a pool, the surface of which swarmed with small fry. Not one was nlarmed. I merely dropped the breech of the gun sharply on the ground, and the whole surface of the water was in an instant flashing with the fish affrighted at the vibration caused by the shock. Any experiment on the hearing of fishes, made in the sight of them, must necessarily be imperfect and illusory. On the other hand, the heavy footstep of a fisherman on the bank will as effectually scare the finny tribe as the sight of thin would do.

The perfect use of the auditory organs of the higher mammals is just as much the effect of education as is that of the tongue, the hand, or the eye. A young child has no apprehension of the direction of any sound until practice has instructed the brain. A puppy, on hearing a call or a whistle, will look all round in perfect ignovance whence the sound proceeds. When the education of the organ is perfected by experience, the direction and e

mate of distance is arrived at with unconcious rapidity. Wild animals are sensitive to the direction and distance of sounds. The "ull 2" not much disturbed by a distant noise, and only "good slowly away in a contrary direction. This power "contained distance and direction cannot be possessed? "color by which the element in which they live only commanicates a universal vibration, equal in all directions.

The auditory apparatus of fish is curiously analogical to that of mammals in some particulars, especially in the carbones already mentioned. The otolith is probably the analogue of the incus of the human ear, and in some lish the rudimentary evidences of the other two—madleus and stepse—are to be found. The principal divergence is in the absence of the eustachian tube, although the late Mr. Jonathan Couch, of Polperro, the eminent entity ologist, thought he discovered a trace of its analogue in certain fishes which have an open tube attached by a nervous plexus to the chamber containing the otolith, and in communication with the surface of the air-bladder. This discovery was, by consent, communicated by me to the discovery was, by consent, communicated by me to the Naturalists' Society of Bristol, on Oct. 1, 1863, and if the deductions are correctly drawn, the air-blaider is not only the origin of buoyancy, but a huge (sympanum also by which every vibration, however slight, is communicated by the origin of the original state or original state original state original state original state original state original state original state original state original stat cated to the animal.

cated to the animal.

The subject is an interesting one, and by no means exhausted. Any naturalist, who will carefully investigate and record his observations on the still observe theories of the hearing of tish, may obtain a European reputation at little more cost than the oxercise of industry and per-

at little more cost than the exercise of industry and perseverance.

WINTER BIRDS IN New Hampshire.—IVarner, N. H., Ecb. 2d.—In this vicinity, I am sorry to say, there is almost a dearth of the feathered tribe the present winter. There were a few redpolls about in the fall, but I have neither seen or heard of any since; no grosbeaks at all. About the middle of December a fine flock of snow buntings (P. nivulis) appeared, containing several hundred individuals, and this is the first flock of more than a dozen or so I have seen for three years, they having been very secree here during flut time. I wanted a few and went for my B.-L. They had alighted on a flat piece of field up a little rise; I went for them; saw three or four near together just on the top of the rise; thought perhaps they would naswer my purpose, and fired, but on going up to those was somewhat surprised to see the snow for some rols beyond strewn with dead and wounded birds. I secured fourteen, twelve of which were in fine condition for mounting. Since that day I have not seen, I think, more than a dozen individuals of this species. There have been very few yellow birds (C. fristis), or tree sparrows (S. monticola) about, and almost none of late; and not one pine finch or crossbill have I seen this winter. Even the jays have absented themselves to a great extent, though I hear one occasionally, but do not remember to have set eyes on one for two months, or near that. Parties who were to procure my specimens of this species do not bring them in: they were very plently in the fall. This would seem to prove the partial migration of the species, not perhaps to a warmer latitude, but certainly to a different locality. An occasional visit from a pair of nutlatebas (Stift earofinensis), and a few days' sojourn of a pair of brown-creeptracy (Certifia familiaris), complete, or very nearly so, my observation on birds for the past two months. The familiar chickaded I have not mentioned, as that little genius we always have in our woods. A friend reports ha

When do Bears Have Yound?—Menominee, Mich., Jun. 21st.—A large black bear was killed a few miles north of here the 18th of this month. The bear was first seen the day before near the railroad, but no effort was made to kill it. Its appearance on the 18th brought out a few men, well armed, who had no trouble in killing her. They found her above the average size and quite fat. By looking around they soon found her den, and in it three small cubs. They must have been but a very few days old, as they were small and eyes not yet open. They were carefully handled and taken away to be brought up on a bottle.

were carefully infinited and taken that you to be obloght up on a bottle.

Is not this very early for bears to have young, and is it not very uncommon for the old bears to be out while the cubs are so young? I have seen bears in the latter part of the month of May so small that two could and did sleep comfortably in a common hat. Thus it appears there must be a great variation in the time of bringing forth their young.

The subject of the breeding of hours is one object.

The subject of the breeding of bears is one about which comparatively little is known. We think that they usually bring forth in January, but believe it to be unusual to find the mother about when the young are so small. As bearing on this subject of the breeding of bears, we quote the following note contributed to the London Field by Richard J. Rowley. He says :-

London Field by Richard J. Rowley. He says:—
In April, 1873, I was driving from Pueblo into New
Mexico to see the Maxwell grant, ourchased by Mr. Waddingham and some other Englishmen. Istopped all night
at the Overland Hotel, in Trinidad, on the Purgatoire
(cadled Picket Wire in Colorado), and found in the office,
under the stove, wrapped in flamnel, a young cinnamon
bear, a week old, perfectly blind and fed on milk out of a
baby's bottle. Some Indians had killed a female bear on
the Raton Mountain, and when opened found two young
ones just ready for birth; one died, this was the other.
I took the trouble afterwards to inquire what became of
it, and learned it had been sold to Capt. Schuyler, to take
to Philadelphia. The cub had a good thick coat of black
lnär.

A FLYING SPIDER.—Warner, N. H.—I had heard of spiders flying, but until about twelve years ago had never seen the thing done. One day in the fall of 1867, while

resting with a few others neg. the top of a hill called the Bald Mink (from its having mint the summit and being one of a group called four Mink Hills). I noticed a spider, in appearance mint and the spider in appearance mint and the spider in appearance mint are not common house spider, having rather long as with not a large body. This spider, when I first sate is with not a large body. This spider when I first sate is with not a large body. This spider hanging highly is to make the wind was blowing lightly. Its position was that of a spider hanging on an upright web, but I could see no web at all: it satiled along without the least perceptible motion, and I wondered how it was held so gracefully in mid-air and at the same time moved along so smoothly. It passed within a few fect of us, and all saw it plainly, but just as it had passed a little and was at a point opposite the sum I saw what before had not been noticed but what the reflection of the sun then revealed, a single line of web, which I saw distinctly on both sides of the spider for a foot or more in the direction it was going and several feet behind it. I could see it plainly as it passed a particular point, and noticed that the web was seeningly bent down at the point where the spider rested with its two forward legs slightly bent over the thread. I think I did not see the end of the web on either side of the spider, and could not tell whether it was sliding on the line or whether both were floating together, but feel very sure that there was no other line or web in the immediate vicinity of my first thying spider.

Is IT A MIGRATORY QUAIL?—Philadelphia, Jan. 27th.—While out guining on Jan. 22d, at Georgetown, Del., Mr. Jacob Fawcett, of that town, killed a bird that resembles our quail very much, but which is nearly white on the breast and lower part, and very much resembles a field lark on the back. In shape it differs very materially from our quail, as it is not near so plump, having quite a long, slim appearance. Mr. Fawcett very kindly presented me with the bird, which I am having set up, and any person wishing to see the same can do so by calling at my place, 1403 SouthEleventh street, Philadelphia.

EDWARD MARER.

We presume that the bird is a migratory quail,

Hish Culture.

FISH CULTURE IN IOWA.

HE Third Biennial Report of the Iowa State Fish Commissioners (1877-8 and 1878-9), now before us, contains abundant evidence of the energetic efforts of the Commissioner, B. F. Shaw, Esq. in addition to the public labors of the State Commission there has been a largely increased interest in fish culture among the peo ple, shown by the establishment of numerous private hatcheries, of which there are now some thirty in successful operation. The total distribution of fishes in various waters during the past two years have amounted to 4,807,800, being an increase over the same period immediately preceding of 1,242.100. These have been-of foreign fish :-

"Shad--40,000 in Cedar River at Cedar Rapids, 40,000 in the Des Moines River at Moingona, and 20,000 in the Boyer River. Lake trout—619,000 in 1878 and 411,000 in 1879, Salmon-as the period of the return of the fish planted in the Cedar River in 1874 is not until 1880 or 1881, the Commission has thought it best to defer further operations in this field until the success or failure of the former trial has been ascertained. California salmon Land-locked salmon, of 500,000 hatched in the 281.500 spring of 1878, only 155,000 were saved from an epidemic They were distributed to Silver Creek, Clear Lake, Cedar River, Imas River and the Des Moines River. Brook trout the success of the distribution of 1877 has shown that some of the Iowa streams are remarkably suited to these fish, and attention has therefore been paid to them. Of 110,000 eggs, the majority were successfully hatched and distributed, some being kept as breeders. advises that carp and smelts be introduced into Iowa waters, and we doubt not that the former at least will prove an invaluable acquisition to the food supply of the State.

By far the most interesting work of the Commission has been the preservation of the young native fish left by the receding waters in the shoal sloughs of the Mississippi River. This undertaking has already been described in the Forest and Stream, but we transcribe the sentences of the report:-

Millions of native fish die in sloughs along the Mississippi river every season when the water is low. The fish deposit their eggs in these sloughs in high water in the spring. The young fish are hatched in due time: afterward the water recedes from the sloughs. They are cut off from the river and gradually dry up, and the young fish perish. The soft-rayed finned-fish die first, leaving he hardier varieties, such as biack, yellow, and striped bass, wall-eyed pike, crappies, sunfish, caffish, bullleads, drumfish, etc. To save a portion of these fish from certain destruction, and plant them in waters where they could live and thrive, has been one of the most cherished plans of the Fish Commission. To aid in the accomplishment of this purpose, I first saw the superintendents or general managers of the various railways running across the State from the Mississippi liver, and procured their consent to assist in the work, by moving an aquarium ear, giving an awater from their water-tanks, stopping trains to distribute lish, etc., which necessary assistance they cheerfully gave free. The superintendents of for the pursicular contents in the content is not a suitable car for the pursicular contents and the pursicular contents and the purpose. trains to distribute fish, etc., which necessary assistance they cheerfully gave free. The superintendent of the U., B. & Q. R'y, kindly furnished a suitable car for the purpose, which in a proper time was arranged in a similar but more effective manner than the one described in a former report, that was used for the same purpose in the fail of 1876. Arrangements were made for the use of the little steamer Dark, and a flat-boat or barge, and they were fitted up for the convenience of an effective crew of

fishermen. These boats, a skiff, twelve live-boats for young fish, minnow nets, etc., constituted our outfit.

oung fish, minnow nets, etc., constituted our outfit. On the second day of September. 1878, with a crevelve nen, all told, we started on the trip, which minently successful, especially so in the first part. On the second day of September, 1878, with a crew or twelve nen, all told, we started on the trip, which was emimently successful, especially so in the first part. As estimated each day by the men engaged in the work, there were taken during the trip 161½ bushels of these young fish. Estimated at the same rate per bushel as in 1876 we took 3,290,000. We fished usually only such sloughs as were entirely cut off from the river and nearly dry, and such as have since been entirely dry. The fish taken from them were saved from extain death, and were just as much of an accession to our waters as if they had been hatched and reared to the same size and age. They were untires of our waters, healthy and beyond the most hazardous period of their lives, and used to finding their own food. If the waters of a great river can be stocked in a few years with a few dozen fish, as has been done with bass in the Potomac and Connecticut rivers, surely we have a right to hope much from so extensive a planting as this in our rivers and lakes. The total cost of the trip was less than eight hundred dollars, which amount would make the cost of the fish caught and distributed less than twenty-five cents per thousand. This work, for cheapness and effectiveness, I think can ascarcely find an equal in the whole history of fish culture, and for this our Commission and the people at large are greatly indebted to the railroads for their free and generous aid, without which the work would have been impossible.

As a whole, the work of fish culture in Iowa has been a success, and the report concludes :-

As a whole, the work of fish culture in Iowa has been a success, and the report concludes:—
In estimating the results of any labor, it is only fair to also estimate its cost. If we take from the total amount of appropriations for fish culture in Iowa, the cost or value of permanent improvements and necessary fixtures and implements, with eash on hand at this writing, we will have expended on fish culture and distribution only a sum equal to one cent for each individual in a population of 1,500,000, during the past six years. In making public improvements in some moderately populated township, if we were limited to a sum equal to only one-sixth of one cent per year for each individual, we dertainly should not expect very great results. With an amount equal only to this in the past five and a half years, the results obtained point to lasting benefits that will more than equal those produced by any other equal amount of money ever expended in the history of the State. With the small resources at hand, and nearly three hundred miles square of territory, it has been impossible to visit and stock every small stream or body of water, but the work has been as general as possible, and it is hoped in due time will benefit every available water in the State.

Evidences of success in fish culture are peculiarly lard to obtain. We can see growing crops from the time the seed bursts the ground until the harvest is gathered; but a lake or stream may be full of growing young fish and present no sign of the fact. They may be caught in large quantities, and the fisherman, from some cause, fail to make his success known, and with fish planted in our waters this is to a certain extent the case, as I have learned in several instances. Abundant evidence has, however, in spite of these facts, come to hand.

New York—Rochester, Feb. 23th.—Feb. 22d we took 6,000 spawn from two California mountain trout and impregnated them with the milt of the Eastern brook trout. This is the earliest in the season we have ever taken the California mountain trout, spawn. We shall continue to California mountain trout spawn. We shall continue to take spawn from our brook trout until about the middle SETH GREEN,

Sea and Biver Fishing.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory of In sending reports for the FOREST AND STREAM Directory of Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as hey may deem of value; State, Town, County; means of access; Hotel and other necommodations; Game and its Season; Fish and its Season; Boats, Guides, etc.; Name of person to address.

GOOD NEWS FOR ANGLERS .- We called at the store of our friends Abbey & Imbrie last Monday. While there we were shown some extra grade fish-hooks which they have been making. They label these books (whether They are of all the loose or snelled) "Highest Quality." approved bends, such as sproat, Carlisle, sneck, Kendall, Of course the finer are higher than the same bends m regular quality; but no angler will grudge the trifling advance.

It may seem a light thing to improve the quality of hooks, but when it is remembered that the demand for the very best goods is always comparatively small, and also that the expense of the undertaking is just as great as if the demand were large, we think all anglers will feel thankful that this enterprising firm is far-sighted enough to see that such efforts are certain to prove eventually a good investment.

It may be remembered that we said last April that Mr. Imbrie had gene over to Redditch, England, the great manufacturing centre of fine fish-hooks. Well, he spent the whole of last summer in that little uninteresting town of Worcestershire. While there he entered into an arrangement with the best and largest house in that place (T. Hemming & Son) by which his firm con-

trol the whole product of their factory. The price of wire ruling, at Sheffield and the general stagnation of trade in England enabled the Messrs. Hemming and Mr. Imbrie to obtain concessions as to quality and price that put them in a position to accomplish the results we now see before us.

We hope some day to see this firm manufacturing all their goods in this country. They assure us, however, that there is as yet no prospect of making their fishhooks here. Almost everything else they can make here and export to England at a profit.

While at their store we saw also a lot of their very pest goods, which have been ordered by the United States Government for the Smithsonian Institution and for the Berlin Exhibition. The excellence of their rods, reels and flies is well known, but we were astonished at the magnificent collection of flies. Some of these flies cost over \$150 a gross to tie. It would pay any angler living in this vicinity to call and see them before they are delivered to the Government.

FLY-FISHING FOR SHAD.—New York.—As the shad season will soon be upon us. I would like to ask Mr. Hamilton, whose letter from Oswego appeared in FOREST AND STREAM Fob. 26th, if he will be kind enough to give a brother angler some points with regard to fty-fishing for shad; what kind of tackle, how much line, kind of fly, and any other particulars which he may call to mind. Also, if he knows of any bait that has been successfully used in augling for shad. This subject I have never seen fully written up, although I have read the FOREST AND STREAM for a number of years, and if Mr. Hamilton can and will graiffy us in this respect he will receive the thanks of many fishermen who are now in the dark.

The approved flies for shad are the white miller and coachman. They should be about the same size as those used for bass. In fishing, let the fly sink a bit below the surface, as in early fishing for trout in cold weather.
The mouth of the shad is exceedingly tender and great care must be exercised lest it be pulled all to pieces. should be glad to hear from shad anglers who may detail their experiences for the benefit of our correspondent and others. The fish may be taken with a fly after they have left the salt water, where they are never caught in

GLOCCESTER FISHEIMEN AND THE NATIONAL MUSEUM.—The number of distinct contributions by Glourester fishermen to the National Museum of the United States now numbers 617, embracing many thousands of specimens, some of great interest to science. A recent contribution from the crew of the schooner Otis P. Lord numbered over twenty specimens, some of them quite curious, taken on a single trip to Georges banks. Among other recent contributions of great value is a curious fish known in scientific nomenclature as the Astrones-fica known which was found in the stonach of a ballium issis known in Sciential boundaries and a halibur taken on Grand banks. This fish is a native of the South, being found in the Gulf of Mexico and other warm lati-tudes, and has never before been taken so far north. This specimen was about eight inches long.

unies, and has never before been taken so fair north. This specimen was about eight inches long.

ONONDAGA COUNTY FISHING CLUD.—Syrucusz, N. Y., Feb. 24th.—In the fall of 1877 a few gentlemen of this city, seeing and appreciating the necessity of a united effort in enforcing the law protecting fish in this section from the rapacity of marketmen, who were taking fish by selines, nets and other divices not permitted by law, and in quantities and at such times as had nearly depleted the waters of this country, particularly Orondaga Lake, situate as it is just on the borders of and within twenty minutes drive of our city.

In the spring of 1878 the club employed as detective a "jolly John Bull," who has since proved that he cannot be bought or driven, and who "does not scare worth a cent," and instructed him to ascertain by whom, when and where, the game laws protecting fish were being violated, and report to the club. Upon receiving such information summons were issued to such violators to call at the "squire's office" and show cause why judgment should not be taken against them in sums stipulated by law. Conviction followed in every case, and han of these nien gave up their nots and signed an agreement not to again break the law, and were let off by payment of costs. These promises have generally been kept. Others more pugnacious, and having less sense, and who "would do this and would not dothat," found themselves in the Onondaga County penilentary, serving a day forevery dollar of judgment taken against them. This man ner of enforcing the law was deemed the most effectual and more conclusive than to first destroy the nets, as has been done in some other sections of the State, thereby involving embittered and lengthy Hitgation, that invariably arrays these marketmen against all protective clubs and organizations. Depredations have since been, and undoubtedly will be, committed, but these "sinners" Lave had fair warning and a liberal treatment, without persecution, and if again caught they will get the full exten

The club has over two hundred members, composed of many of our best and most prominent citizens, and has accomplished much that commends it to the public, and intends to continue the good work. Now if other similar organizations be formed in every country of this State, having the protection of fish their only object, and the law be so enacted as to forbid taking fish in inland waters except by hook and line, it would not be many years before there would be such quantities of fish in every lake and stream and rivulet that none but a lunatic would ever again think of using a net or a seine. Incidental to this subject. I would like to say that I notice by the FOREST AND STREAM that protective clubs.

ore continuing to organize in every State of the Union, but I do not see, and cannot learn, that any special, decided, or continuous efforts are made to enforce the law, and these clubs, without such action, are a sham and an expensive delusion. It is time that what has horectofore been no man's business should now be made by concentrated action every man's business.

Synacuse.

-Next season the Leatherstocking Club, of Oswego, will — Next season the Leatherstocking Club, of Oswego, will have a fleet of a dozen or more skiffs and canoes on the Little Sandy pend, which has been leased by a few of the members. Major N. A. Wright has just received a white cedar ducking skiff from Rushton, of Canton, St. Lawrence county, which will go into the fleet. It is a regular nonpariel.

—One day inst week at Ogdensburg, Wm. Stillwell, while fishing through the ice, caught fifty-eight fine perch. He baited a double hook with worms and fourteen times he harded up two fish.

The Rennel.

THE NEVERSINK LODGE KENNELS.

THERE is probably no place in this vicinity where the traditions of the past in connection with big and small game shooting cling more closely than they do with the once wild and inaccessible valley of the Noversink. It is in this beautifully picturesque location, now within easy reach of New York City, that Mr. A. E. Godeffroy, proprietor of Neversink Lodge, has laid out his game preserve and established his kennels. The farm, which covers over one thousand acres, is within two miles of Guymard, Orange Co., N. Y., on the Eric Railway, and about eighty miles from this city. Nestling as it does from side to side of the valley, it is most favorably located for being thoroughly preserved, nor have we ever seen any section better adapted naturally for the purpose for which it is intended.

The preserve is divided by skirtings of low brush and wild grass into a series of large open flats, these being subdivided by a magnificent trout stream of over four miles in length. This has been dammed in four places thus enabling different sections of the woodcock cover to be flooded and kept in fine feeding condition. Another wrinkle, also adopted to attract the much prized long-bill, is that from time to time during the autumnal flight, spots on the ground are raked clear of the underbrush and drift stull before the flooding is resorted to, so that when the water drains off the cover is dotted with bare patches of loamy soil. Paths have been cut through the centre of the strips of cover, but the brush and undergrowth have otherwise been left unmolested, leaving an excellent harbor for the different varieties of game that abound on this well-stocked proserve. We can conceive of no better place for the holding of field trials, as the scrubby nature of the brush would admit of the dogs being easily kept in sight, while the broad Neversink fliver, which makes its course through the valley, with an occasional duck or snipe along its edge, would admit of retrieving being done from the water. Besides a large number of native quail, there is an excellently contrived quail house stocked with over one hun-hred and fifty birds. These are to be turned out shortly to make room for a large shipment of over seven hundred which has been ordered and will be delivered within a few weeks. Ruffed grouse are quite abundant, and English pheasants are to be introduced. Twenty-five couple of English rabbits are now on their way to a newly made warren in a Yankee home; the bunnies having been son by Mr. Fleetwood Sandeman, of London.

Before speaking of the main kennel it would be well to state that each of the outlying tonant houses are provided with a small kennel, so that as occasion requires dogs can be farmed out and separated from the rest of the stock. On the same principle the puppy kennels are removed by over half a mile from the main kennel.

It is delightful to say that poachers and trespassers find but little comfort in wandering on this spot, and that when captured, as they are nearly sure to be by one or other of the sixty men empl thus enabling different sections of the woodcock cover to be flooded and kept in fine feeding condition. Another

systematized kennel farm that we have everseen in this country.

The location of the main kennel is simply perfection for the sporting and larger classes of dogs. Situated as it is on declining ground between the sheltering hills that form the northern and southern boundaries of the valley, and within a stone's throw of the head of the sparkling spring water stream, it receives both the morning and afternoon sun. The building, which is of wood, is eighty feet in length and sixteen feet in width, is admirably ventilated by rows of windows under the eaves of a high peaked roof, and we noticed a wonderful absence of all dogsy smell. The flooring is raised from the ground thus precluding all dampness, and the kennels are ranged on either side of a long and moderntely wide entry that runs through the length of the building to the cook-room, which occupies the width of one end of the structure. Entering the building from the other end we pass six kennels on both sides, each of these being six by eight

feet, and each one provided with a separate yard six by fourteen feet. These are used for the general stock, and are occupied by one or a brace of dogs. We then come to four larger kennels, two on a side, for brood bitches are occupied by one or a brace of dogs. We then come to four larger kennels, two on a side, for brood bitches and puppies, the two puppy kennels having a large covered extension jutting out into their large yards. All the kennels being so contrived that the dogs can be viewed from either the inside or out, and be moved about from one kennel to another without being brought in contact with other of the stock. The cook-room is supplied with boilers, cooling-troughs, and all the appurtmences of a well appointed kennel. Mr. Godeffroy superintends in person the whole management, but he is also ably assisted by Philip Thurtle, who was sent out from England about a month ago by the Rev. J. C. Macdona, Since then Thurtle has had charge of the kennels and the handling of the dogs; he is known as a thoroughly competent man, having gained a reputation on the other side as a first-class field trial trainer, having successfully broken and handled Plunket and other well known winners. Approachable from the cook-room and two outside gates under the lee of the L shaped barn buildings, is the exercising ground, a very large enclosure with plenty of sun, yet shaded here and there by several old apple trees. This has been thoroughly gravelled and beelded with stones, and is an admirable place to help keep the stock in good condition.

apple trees. This has been thoroughly gravehed and bedded with stones, and is an admirable place to help keep the stock in good condition.

Of the thirty-eight dogs now kenneled on the farm, the large liver and white pointer Croxteth, by Lowe's Young Bang,—S. Price's Bang—Davies' Luna; out of Macdona's Janc,—Lord Sefton's Sam and Fiftr, claimed our special attention as an animal that would do well on the bench, and stoll better in the field. He has only been in this country since last August, where he was brought by the Rev. J. C. Macdona. He is now a little over two years of age, strongly built, with great propelling powers, and has a remarkably fine head; it may be well to say that Croxteth, through his ancestors, Sam, Handet and Drake, combines the best blood of Lord Sefton's, Mr. Whitchouse's and Sir Richard Garth's strains, and is half brother to Sir Thomas Lemant's wonderful pointers, Prion and Scamp, winner of treat and second prizes at the Field Trial Derby, 1878, and is also grandson of champion Bang, winner of ten lield trials, and never beaten at a dog show; thus combining good looks with good work in the field. Through his ancestors, Cornwall Legh's Mars, Newton's Ranger, and Garth's Mite, he inherits the grand strain of blood that culnitated in Mr. Garth's extraordinary pointer Drake, who, with Mr. Macdona's wonderful setter Ranger, ranks among pointers as Ranger does aniong setters, as the fastest and greatest champion field trial winner of this century. Croxteth won fourth in the English Field Trial Derby, 1879, out of 170 entries, and won second prize at the International Dog Show, at Hanover, May, 1879. For Southern quail, and especially for Western shooting, Croxteth would be a grand dog; he possesses an easy lope, which carries him over the ground which he has an excellent opportunity of seeing him handled by Thurtle, who has him under right courrel, and Croxteth exhibited a nose of admirable quality. The day was anything but a fit one for any practical test of the dog's ability, but although

cestors. All this was the more commendable when it be immendered that the dog has never scented or been worked on quall until the day previous to this private trial.

It is not to be a supplementation of the control

Gay, by Paulo out of Nettle; she has just whelped four fine little puppies, by Rattler, and was in her most amiable mood when we met her at the keeper's house. In bidding good-bye to the Nevershik Lodge, its kennels and inmates, we must stop to say to Mr. Godeffroy that we wish him all the success and enjoyment that his onterprise and good taste richly deserve. May his game register show for years to come, the jolly good days that it has recorded in the past.

NEW YORK BENCH SHOW.

Pennsylvania Railroad—Frank Thompson, Gen. Man-

ager.
Long Island Railroad—C. M. Heald, Gen, Ticket Agent,
New York, Lake Eric and Western Railroad—J. N.
Abbott, Gen. Pass. Agent.
New Jersey and New York Railway—J. W. Hasbrouck,

Supt. Central Railroad of New Jersey—H. P. Baldwin, Gen.

Pass. Agt.
Following are some of the rules and regulations:-Following are some of the rules and regulations:—
2. Every person who enters a dog for exhibition must be the bonu fide owner (or the duly authorized agent of the owners), at the time of closing the entries, and must identify it in the entry by its name, and, if known, its age, and also, if known, the names of its sire and dam. If the name of a dog which has won a first prize has been changed, his name at the time of its winning any and every such prize, and the place thereof, as well as its present name, must be given. If the names of its sire and dam are not known, he must be entered, "pedigreo unknown."

unknown.

4. Puppies may compete in grown classes, except in classes where they are specially excluded, and will be udged as if matured, but cannot compete in more than

one class.

5. A dog which has, when a puppy, won a first prize in a puppy class, is not thereby disqualified from competition in a class where first prize winners are excluded.

6. A dog, to compete in a Champion class, must have won a first prize in an open class at Springfield, New York, St. Louis, Philadelphia, Baltimore, Boston '73 or '79, Detroit, St. Paul, or Pittsburg; and a dog, having won a first prize at any show held as above, cannot compete in an open class when there is a Champion class for its kind, but must compete in such Champion class.

7. A dog affected with mange, or other contagous disease, is disqualified from exhibition.

8. The scales of noints given in the third edition of the

ease, is disqualified from exhibition.

8. The scales of points given in the third edition of the
"Dogs of the British Islands," by J. H. Walsh (Stone-honge), will be used by the judges, when necessary, in henge), will be used by the property henge), will be used by the property and an imported English setter is understood to be one directly imported, or whose sire and dam were both imported to take home their dogs

directly imported, or whose sire and dam were both imported.

9. Exhibitors will be permitted to take home their dogs every evening after ten o'clock upon leaving a deposit of five dollars with the check clerk, and surrendering their identification tickets, both of which will be returned on the reproducing of the dog in the morning before nine o'clock. If prize winners should be taken out and not returned, the prizes will be forfeited.

11. Exhibitors need not accompany their dogs. They can be sent direct to the exhibition hall.

12. The managers will use due diligence for the care and safety of all dogs exhibited (watchmen being on duty both night and day).

13. The members of the committee and managers will be in constant attendance, and especial attention will be given to the care of pet dogs, commodious boxes with wire netting being provided for the same. Each of these boxes will have a hasp and staple attached, so that the owners may, if they see fit, keep their dogs under padlock and key.

15. No dog will be received unless supplied with a suitable leather collar and chain.

16. Bitches with pup, and small pups weaned, will be provided with suitable pens, if application is made at time of entry.

INFLUENCE OF PREVIOUS SIRES.

BLACKSBURG, VA., Feb. 12th.

Editor Forest and Stream:—

Editor Forest and Stream:—
A correspondent asis "Are the whelps of a pure setter bitch by a pure setter dog, pure setters, provided the bitch had a litter formerly by a bull dog," and you say no. I am ware of all that has been written on this point by able authors, and yet I doubt it. I speak from experience, for I have been looking for a case of transmitted influence of a former sire for more than thirty years, and have not found one. In an extensive experience as a medical practitioner, I have examined the children of a large number of women by second marriages, and never saw anything more than a mere fancital resemblance to the former husband in moral, mental or physical trails. I have had setters for many years, and very often bred setter bitches alternately to pointer and sector dogs, finding the so-called droppers the best field dogs, but nover saw any case of the influence of a former sire in any of the many litters so bred. My experience with fox hounds has been greater, with the same result. I have examined the foals of some thousands of marcs bred alternately to jacks and stallions to see if I could find any traces of the former sire, but entirely without success. I have also made extensive examinations of cattle, sheep and swine, and have made experiments to see if I could produce any such thing. I have done the same with chickens, cats and other animals. Now, therefore, unless such cases were excessively rare, I think I ought to have hit upon one in thirty years' observations. I have examined all the cases which form the stock in trade of authors, and there is scarcely one of them that does not admit of explanation as a common case of atayism, for ittle or nothing is pretended to be known of the ancestors. cases which form the stock in trade of authors, and thero is scarcely one of them that does not admit of explanation as a common case of atavism, for little or nothing is pretended to be known of the ancestors of the animals in either male or female line. I find no such cases where there is a pedigree of authentic character. As to Mr. Darwin's pangenesis hypothesis, it seems to me to be the most extravagant and extraordinary of all recorded hypotheses. If Prof. Agassiz had not written anything on the question, I would look upon the whole thing as moonshine. The facts brought forward by that great naturalist go to show that in the lower animals an individual may in a certain sense have two or more fathers, for in them ova may apparently be partially impregnated in a very immature state of development. For instance, the father which impregnates the ova which produce one litter, say of guinea pigs, may at the same time partially impregnate those which form the crop for the noxt litter, and they, being fully fertilized subsequently by another male, and then the young produced having two fathers are as apt to be like one as the other. But in higher animals, where far longer intervals clapse between the successive ovulations, the chances of such a thing are vastly lessened. I speak from very ample experiones, however, and regardless of all theories, when I advise that no one shall give up breeding from a valable setter bitch which may have been unfortunately impregnated by a dog of another breed.

7 You will see we say below to A. W. B. that "it is a nat-

M. G. ELLZEY. ? You will see we say below to A. W. B. that "it is a natural tendency, not an absolute law." Your negative ex perience does not disprove the positive experience of other reliable observers, nor have we said that this natural tendency extends to other classes of animals than those which have their progeny in litters. There is no reliable evidence that it applies to the human race.

Boston, Mass., Feb. 16th.

Editor Forest and Stream;—
In your issue of Jan. 29, X Y Z asks; "I have a pointer bitch three years old; has been bred two or three times to a No. 1 pointer; is now in whelp to an English setter. Will this cross affect her future progeny, and in what way?" Your answer to him, and also to B., Concord, is: "Not necessarily so, but it is not positive that it will not affect her future progeny. Should the bitch have been bred in the first inistance to a setter there would have been indications of the cross ever afterwards." Now, for the benefit of the above persons, I should like to relate my experience in the same subject. On the 17th of October, 15t7, I had a St. Bernard bitch accidentally covered by a Newfoundland dog, and as it was her first heaft supposed that she would in her future progeny show the cross. When she whelped she was dam to seven as black pupples as I ever saw. Words were inadequate to express my disgust, but I thought I would try again, and watch the result. July 4th, 18t8, she whelped, the sire being a thoroughbred St. Bernard dog, and as fine a litter of pupples as I ever saw. I have since bred several litters, and never saw the slightest indication that she was ever cross-bred. I have also seen soveral crosses when it showed itself in the next litter, but not in the third.

We should have said there probably would have been

We should have said there probably would have been indications of a cross ever afterwards. It is a natural tendency, not an absolute law.

-Mr. Robinson, of the N.Y.N.H. & H. Railroad, has a very fine pug, which, having been picked up on the London streets, was brought over to America by Capt. Goss, of the Constantine. Puggy, who richly merits a more dignified name, has all the points of the finest pug strain, is really a handsome animal, and, we understand, will be entered at the coming New York Show.

Large Importation of Dogs.—Mr. A. H. Moore, of Philadelphia, intends sending a large string of entries to the New York show. Mr. M. has coming over from the other side seventeen or eighteen dogs—pointers, setters, etc. It is to be hoped that these will reach here in season to be exhibited.

THE DERBY.—Remember, entries for the National merican Kennel Club Field Trial Derby close April 1st, upples born on or after April 1st, 1879, are eligible.

MONTCLAIR HUNT.—Montclair, N. J., Feb. 28/h.—The Montclair Hunt, of Montclair, N. J., are about to send to England for another importation of beagles. They breed only from thoroughbred stock.

Names Claimed,—Victoria.—Miss Julia Wygant, of Peekskill, N. Y., claims the name of Victoria (Beau-Belle) for her black and tan cocker, from the kennel of Mr. A. C. Waddell, Topeka, Kansas, wholped Nov.23d,

1879.

Prudent and Marvel.—Mr. Garrett Roach, of this city, claims the names of Prudent and Marvel for his two pointer bitch puppies by Mr. Orgill's champion Rusb out of Mr. Yan Wageneu's champion Duchess, whelped June 21st, 1879; bred by Mr. Geo. Yan Wagenen, this city.

Marim and Charm.—Mr. Geo. Van Wagenen, of this

21st. 1879; bred by Mr. Geo. Van Wagenen, this city, Maxim and Charm.—Mr. Geo. Van Wagenen, of this city, claims the names of Maxim and Charm for his two pointer bitch puppies, by Mr. Orgill's champion Rush out of his champion Duchess, whelped June 21st, 1879; bred by Mr. Van Wagenen. Elaine.—E. & C. Von Culin, Delaware City, Del., wish to claim the above name for their lemon and while setter bitch puppy, by Pontiac the out of champion Petrel out of Pride of the Border) out of Dr. W. W. White's Queen Anne; she by Carlowitz out of Queen Bess, whelped Jan. 1st. 1889.

Pride of the Border) out of Dr. W. W. White's Queen Anne: she by Carlowitz out of Queen Bess, whelped Jan. 1st. 1880.

Nipp.—Mr. C. H. Hauptman, of Irvington, N. Y. claims the name of Nipp for his red Irish setter bitch, presented to him by Mr. H. R. Bishop, of Irvington, N. Y. Nipp is out of Mr. Bishop's Biddy by his Doctor, born March 2d, 1879. Mr. George Laick, of Tarrytown, N. Y., is breaking her.

Byron.—Mr. Tinsley, of Hamilton, Ont., claims the name of Byron for liver, white and tan colored cocker dog, by his Dash out of Mr. R. Day's Floss; whelped Dec. 27th, 1879.

Sis and Buth.—Mr. James Chubb, of Cleveland, O.,

27th, 1879.

Sie and Bub.—Mr. James Clubb, of Cleveland, O., claims the names of Sis and Bub for his two red Irish sective puppies, bitch and dog. Sis for bitch by champion Elcho-Gip, prize winner Pittsburg, Pa., bred by Mr. W. A. McIntosh, Sept. 10th, 1879. Bub for the dog, Arlington-Flora, both prize winners, bred by Messrs. Lincoln & Hellyer, Warren, Mass., Oct. 15th, 1879.

Trip.—Mr. Geo. II, Bigelow, of Natick, Mass., claims the name of Trip for his dark liver and white cocker spaniel bitch, weight 20 lbs., bred by Mr. Chas, Allen, of Worcester, Mass., out of his Cute by Grip; whelped June 3d, 1878.

3d, 1878. Livy III.—Mr. Geo. H. Bigelow, of Natick, Mass., claims the name of Livy III for his orange and white thewellin setter bitch, out of Livy II-Livy-Prince, owned by Mr. Llewellin, by Dan, Leicoster-Peeress; whelped June 20th, 1879.

SALES.—Racket.—Mr. Garrett Roach, of this city, has sold to Mr. D. Ferguson, of Milwaukee, Wis., his liver and white pointer dog Racket, by Sensation out of Queen

II. Rob.—Mr. J. Yeasley, Jr., of Coatesville, Pa., has sold his setter Rob (Rob Roy-Pocahontas) to Mr. Arnold Bur-gess, of Hillsdale, Mich.

Whelps.—Floss.—Mr. N. L. Lafreniere's Floss whelped Feb. 22d, seven pupples, four dogs and three bitches, by Mr. H. F. Deane's Laverack setter Pride.

BRED.—Belle-Lord Dufferin—Mr. George C. Colburn's pointer bitch Belle has just returned from a visit to Mr. C. DuBois Wigstaff's lemon and white pointer Lord Dufferin. Belle left Babylon, L. I., yesterday, and has gone to Boonton, N. J., for the scason.

Counters-Roderick.—Mr. J. Yeasley, Jr.'s, Countess (Leicester-Pocahontas) to Mr. A. W. Moore's imported belovirk.

DEATH—Mack.—Mr. D. D. Lawlor, of the Grand Central Depot, had the misfortune to have his Irish water spaniel Mack run over and killed on Feb. 14th. Mack was a veteran prize winner and was well known to all exhibitors in the East,

Archery. TARGET VALUATIONS.

Bosron, Feb. 28th

Editor Forest and Stream:

The tyre in archery accepts at first everything as it is, as having the sanction of the authorities. As they progress and become hetter acquainted with its practice and theory, those of a think-ing mind who find things which to them seem to be wrong ask. why is this as it is and they look to those whom they consider authority for an explanation or reason, that their misunderstand-ing may be corrected and that they can go on with the feeling

that all is as it should be.

Such was the writer's condition when he put the question, Are the rungs of the target valued in equitable proportion?

the rings of the target valued in equitable proportion?
Having no feeling in the matter save to get at a right and just conclusion, he hopes that others will have only the same intent, and that the views of those interested may be fairly presented, not only as opinions, but with reasons for those opinions.

Mr. Will H. Thompson, in the FOHEST ASH STREAM of Feb. 19th, misrepresents the writer, unintentionally, we believe, by saying, "Mr. Brownell even thinks that the archer/who shoots big arrows has an advantage over the one who shoots a small one." This statement, by virtue of its origin, will be accepted by many as a fact, and they will not have a correct opinion of his ideas, for Mr. Brownell never thought or expressed that opinion, and a natural inference would be that Mr. Thompson, being mistaken in that assertion, may be in some of the others expressed in the same article. the same article

the same article.

The opinion which I first expressed in this question of the relative valuation for the several rings of the target was that the gold and red received too large a per cent, of the total value, and at the expense of the white and black. This I thought could be at the expense of the white and black. This I thou, ht could be remedied by valuing the several rings from one to five, which would transfer 21 per cent, of the total value of the target from the gold to the white, and 11 per cent. From red to black; and it should be remembered that I referred particularly to the York Round in considering the question, where as I have before shown the majority of bits are in black and white.

I gave certain reasons for thinking as I did, and asked for the objections, and why the present values were adopted. As Mr. Thompson gives them in bis communication they seem to be-First. The difficulty which would result to those who wish to compare scores with those which have been made under the present valuation.

Second. That the valuation of the rings of a target should be in proportion to their area, and that the English early found this to be the case, though they do not follow it.

Now, I am not wholly satisfied with this statement and the ex-Ago, tain not worny sansing with this statement and the da-planation of their great variation from what they found to be a fact, particularly as it is not borne out in practice; indeed, it seems to me that it can be proved a fallacy.

Two archers shoot an arrow each at a target. What is the crirevolutions of merit? Proximity to the center. Shooting two or more arrows, the merit must be in their aggregate nearness to the center. How is this to be determined? By measuring the discenter. How is this to be determined? By measuring the categories thance from the center to the point hit by each arrow, the total of these distances giving the aggregate, and the less this distance the

these distances giving the aggregate, and the less this distance the botter the shooting.

Now, to compare this theory with the theory of valuation by area. A shoots five arrows and makes a bit in each color exactly half way between the inside and outside rings. Those hits would score by the ratio of area 16.1, and their aggregate of distance from the center is sixty inches. It shouts five arrows and makes two reds, one blue, and two whites, also in the center of those colors. The value of these bits by the area is 16.1, and their aggregate of distance sixty inches, exactly the same as A's arrows.

With the distance the same his not lives the A should have a With the distance the same it is not just that A should have a

with the distinct the slink is not just that A should have a score nearly 60 per cent. better than B.

We have a target of a certain size, with the distance from the center to outside divided into five rings of equal diameter, and desire to retain its size and divisions.

To rate these several rings by their distance from the center we To rate these several rungs by toor distance from the center we find that the ratio is exactly 1, 2, 3, 4 and 5. That is to say, the second ring extends twice, the third three, the fourth four, and the fifth five times the distance of the first from the center. These values would contemplate the smaller scores being the best. And to make the larger score the best we must invert the order of values. This is supported by measuring from the outside toward the center, and we find that the second ring is twice, the third three times, the fourth four and the fifth five times the dis-tance of the first ring nearer the center, and should increase in value in that proportion. And I arrive at the following conclu-

There is but one accurate method of comparing scores in shoot ing, and that is, to measure the distance from the center to each point lift, and divide the aggregate by the number of arrows shot, giving you the average distance from the center for the

whole number of shots.

This would necessitate a target large enough to take in all arrows shot, and is, of course, impracticable for general use; but in this way we can ligure out the difference between scores, and compare it with the difference in the same scores, figured by one compare it with the difference it that an excites, ignited or another valuation of the rings of the target. In this lation I average the bits in each color as being midway the inner and outer edge of that color, and multiply the from the center of the target to the center of the color by the number of hits in that color. For golds, I take one-half the disnumber of ints in that color. For goins, I take one-mit in elistance from the center to the outer edge (2.4 inches) as being the average of the hits for golds.

The misses I average as hitting the center of an imaginary ring outside the white, and of the same breadth, or 25.4 inches from

I have figured all the American Round scores made at Beacon Park, by this measurement, by the one to nine, and by the one to dive valuations, comparing one-half with the other; and also many single scores in the same several ways, and have not found un instance but in which the difference by the one to five values was nearer the difference by measurement than the difference by

was nearer the difference by measurement than the difference by the one to into values.

To Illustrate, I will take the scores previously mentioned, 20 bits, 145 value, revalued 57, and 30 bits, value 122, revalued 78.

By the present valuation, the score of 20 bits exceeds that of 30 bits is 8 per cent, by the revaluation 14.4 per cent, and by measurement 14.1 per cent, showing the revaluation to differ from the measurement only three-tenths of one I per cent, while the present valuation differs nearly 5 up recent. To king the selvent the present valuation differs nearly 5 per cent. Taking two sixty yard scores from my score-book, 23 hits 71 or 47, and 17 hits 73 or per cent; while by measurement the 23 bits average, 38 of an inc.

2.8 bits 2.8 per cent; while by measurement the 23 bits average, 38 of an inch nearer the centre, and by the revaluation 2 points more than the

Taking the Beacon Park scores of 50 hits, 202, and 55 hits, 201, by naming the beaton 1 and a coverage of the man, something and of this 201, by assurement, the 55 bits average, 11 of an inch beater shooting, and though bits, showing the 55 bits to be the best shooting, and should have the larger score; revalued, it exceeds the score of 50 hits two points.

It is only in the comparison of a score of many hits and small values with the score of few hits and large value values win the score of rew mis and large values that the relative positions are changed, and I ask, is it anything but justice to the many hits in the outer colors to give them their just proportion of the total value of the target?

Let us give fair and just consideration to all suggestions and Lotting give tair and just consideration to all single-strong and improvements, for they cannot materially change actively change and what it is and will be. Make every conceivable improvement or change in the equipment—"tis but a small part of the play—for you will yet have the erowing portion of the sport, the individuality of the archer, unobanged and unchangedable.

duality of the irrelet, audiance and arrangeance.

As for the difficulty of comparing scores, as long as we retain
our 48 inch target and the five equal divisions of it, there will be
the little trouble for anyone to compare their scores with those
of old or with others of the present time. Each archer lans, or
should have, his detailed score in his score hole. If A, who uses the 1 to 5 values, wishes to compare his score with any made h the I too values, wiscost o compare his score with any made by the present valuation, he has only to figure up his his in the soverall colors by that valuation, and wise rerea for E, if he uses the present valuation, and whise to compare his score with A's.

I cannot understand why it is that Mr. Thompson wishes use for practice archery another year before we ask questions, and seed

discord in discussion. If there is that in our present system archery which will not bear discussion, it is better to out with

It is, of course, to be desired that we keep a uniform valuation. and I am not not to advise a change without due and proper con-sideration. Nor would I yet think of counting the for an acquisit, but in view of the foregoing facts it does seem to use that there is something in a proposition which is harmonious in theory and practice, one against one that does not accord in these particulars. ANDREW S. BROWNELL

PACIFIC COAST ARCHERY ASSOCIATION .- San Francisco, Fel PACIFIC COAST ARCHENY ASSOCIATION.—Sau Francisco, Feb. 29th.—Six clubs were represented by their delegates at the meeting of organization to-day, the Oakland How Club, by F. C. Havenger en and Al. W. Havens; Facilia Archery, by C. C. Cadman, Hangy, V. Pachine, A. F. Low and W. L. Oliver; Capital Bow Club, by J. P. Allen, A. F. Low and W. L. Oliver; Capital Bow Club and Sherrest, by Danfel of Council (Al. W. Havens, proxy). C. C. Cadman entering the Council (Al. W. Havens, proxy). C. C. Cadman called the meeting to order, and stated that the object was to further the practice of archery throughout the Illigital States. The ther the practice of archery throughout the United Stales, The following officers were then elected:—President, C. C. Cadman; First Vice-President, N. E. White, of Sacramento; Second Vice-President, J. P. Allen; Recording Secretary, Harvey Darneal

Treasurer, Al. W. Huvens. Executive Committee:—Daniel O'Connell, F. C. Havens, F. M. Ward and George E. Mills, with the President added as an ex-affein member. The rules and by-laws of the Pacific Archery Club were adopted with a few changes, for the government of the Association.

It was decided to have two general meetings every year for It was deoided to have two general meetings every year for competitive practice, one in May and one in September. At these meetings it is proposed to have a visitors' prize, open to all archers living in parts of the State where no clubs are in existence. All team shooting must consist of four members in each team shooting the American Round. The champion medal to be shot for according to the "Double York Round," and the championess medal according to the "Double Columbia Round."

CORTLAND ARCHERS.—Cordinal, N. Y., Feb. 22th.—At our regular weekly meeting for practice at Van Bergen Hull the following scores were made by the members of the Cortland Archery Club, who were present; distance; 30 yards; 40 arrows each:—

| 1st 30, | 23 30. | Bct 30. | Total. |
|-----------------------|--------|---------|--------|
| Dr. F. O. Hyatt 195 | 213 | 202 | 610 |
| Willis Cloyes 200 | 190 | 200 | 590 |
| Jas. Schermerhorn 190 | 182 | 194 | 566 |
| S. Bull 153 | 180 | 174 | 506 |
| A. Mahan 151 | 154 | 160 | 465 |
| C. F. Turner | 148 | 146 | 45.9 |
| Dr. G. H. Smith 130 | 148 | 179 | 457 |
| Mrs. A. Mahan 102 | 110 | 84 | 302 |

The club began practice early in December, 1879, and but few of the mombers had had any previous practice. We will send you scores made at regular club practice from time to time, and hope other archery clubs will do the same. A. M.

-The New York Archery Club have a masquerade sociable this evening.

Answers to Correspondents.

Correspondents who may send us their proper name and address will always receive prompt attention in these columns. We require a man's name for two rea sons: (1) sometimes as a guarantee of good faith, and (2) always as a matter of common courtesy.

Write more explicitly, and name the applications you have tried and which have failed.
- cations you have tried and which have falled.

 C, Vallosta, Ga.—We should think that A and B, having tied, ought to play it out. We are not authority on Cassino, however, nor on any other game of cards. Should we profess to be, this column would be deluged with a nover-ending series of calls for card decisions, the settlement of which would be hardly worth the while of an intelligent and disinterested man.
- the while of an infelligent and offsirressed man.

 E. A., Now York.—The strain of Mr. J.B. Milley's Grouse is excellent on both sides. On the sire side Gift gues back to La Touche's celebrated breed, and Andrew Dunne, who owned Loc and Game, land his breed of Irish ros exters for over fifty years. Rouge, the dam, goes back to Hendrick's and Clauricarde's breed. the latter having the reputation of being among the purest in
- D. W., Esperance, N. Y .- 1. The Tathams use avoirdupois D. W., Esperance, N. 1.—1. Have Internal use a convintions weight, I ounce of which contains 3371 froy grains, 450 grains troy making one troy ounce. 2. All of Dixon's implements are numbered for convenience in ordinary goods. The numbers are arbitrary, and beyond designating different articles have no significance. The measures Nos, 1,105 and 1,107 differ only in significance. bondle, not in size.
- F. D. L., Indianapolis, Ind.-My Gordon setter, three years old. F. D. L., Indianapolis, Ind.—My Gordon setter, three years old, has a black substance growing over his eyes, which now covers about one-quarter of the eye, and in order to see me or any objects at all the distance he has to raise his head. Will consider it a kindness for you to advise me what to do. Ans. It is probably due to a growth that can only be removed by a surgical operation. We would advise you to consult a medical practition.
- W. A. S., Greenfield, Mass.-My sotter dog has a white film groww.A. S., Greenheid, sines.— my setter oug has a write inin grow-ing over one of his eyes. Chu you, through your valuable paper, inform me what will remove the film and restore the sight? Ans. If the film is due to quacity of the corner it will be permanent; if of more simple character, it may be removed by dusting into the e twice a day a very finely pulverized powder, consisting of one t white sugar and two parts calomel. Write the result of treat-
- F. W. J., Unionville, Conn,-1. By chambering shot'is meant so proporting the pellets on the wad in the shell that they will be flatarranging the period of the ward, and the whole layer fitting snugly in the shell. In choke-bores the shot should be chambered on a ward fitted into the barrel of the gun at its most confined point. You will flind many useful bluts on this subject in recent numbers of this paper, and a little experimenting will show you how many hot your gun will chamber.

CRUISER.—S. Informs us that after a season's experience with Coughtry's collapsible diagcys he can recommend them in all respects. They weigh only from 35 to 50 pounds, according to size; are easily folded and expanded; stow into their length, half their beam and five inches thick; are quite seaworthy and wear well, but it will not do to overload them, as they become crunky when deeply immersed. A nine-foot boat will carry two men in safety, but three will be too much for her.

- C., New York .- I have a setter bitch two and a half years old that has warts in her mouth. What shall I do for her? Ans, do not state if the warts are isolated growths or so numero to constitute an eruption of warts. If the former, usen ligato constitute an eraption of warts. If the former, use a ligature, L. c., a silk thread thed very tightly around the base of each wart; if the latter, use causic of airrate of silver. Bit the dog in either treatment with a piece of rubber hose; you will then be able to work more freely and quickly.
- work more freely and quickly. W. B. B., Cooperstown, N. X.—I. I have a ritle, "Greene's patient, Nex. 17th, 1837," but have never been able to obtain eartridges that would Be it. 2. Does the grun load at direcch or inuzzle? Ans. I. Your rifle, like many others made at that time, is antiqueted, and you cannot find eartridges for it. Better dispose of it and get a modern arm. 2. We confers ourselves unable to tell you. You neight look up the patent records at Waishington, and see what Greene chinnel it to be.
- see what Greene chained it (e) be,

 J. W. T., Ashland, III. My uncle, near here, has a fish pond, covering about seven acres and running down in dopth from four in,
 to ten ft. It is stocked with our native 648. How would it do to
 sow part or all of it with wild rice, so as to make it a good feeding
 place for ducks and geese? Ans. This would add much to the
 sporting value of your pond. Hise may be sownether in spring
 or full. We have two advertisements of send for rule in another
 column. Evilors the discretizable in each for rule in another column. Follow the directions already published by ourselves and you will be successful
- and you will besuccessful,

 R. W. D., Derby, Coun.—My dog is excessively constipated.
 Have fried pills and injections, but thus far without relief. As
 might be expected, he eats little. What shall I do for him? Ans.
 Feed no meat for a week with the exception of boiled liver, to be
 mixed with vegetables and corn meal properly cooked. For immediate relief, an enema of a tablespoonful of castor oil mixed,
 and if medicino is needed subsequently, a tempoorful of castor
 oil with two of olive oil ence a day, combined with plenty of
- A. B. S., Suitland, Md.—My setter bitch three years old has a cry bad cough. She coughs continually, except when lying own or when asleep. She is in good order, and cats well, her eyes do not discharge, nor does she in any way show distemper When she is coughing she tries to vomil, but does not succeed.
 Please advise me what to do. I do not know whether she has had
 the distempor or not. Ans. Try tablespoonful of salt dissolved
 in water, followed in a few hours by an ordinary does of castor Write to us the further symptoms.
- oil. Write to us the further symptoms.

 Forestour.—I. How heavy should a .45 cal. rifle be-and what length of barrel for shooting up to 500 yards accurately? 2. What game may be found in Maine? 3. When may game be killed under existing laws of that State?—4. Where can Newhouse's steel traps be bought? Ans. I. Nine and a half pounds, with 30-inch barrel. 2. See in last week's paper descriptions of the Rangeley country. 3. The open scasons of that State are: Deer, Oct. 1st to Jan. 1st: sea fowl and plover, Sept. 1st to May 1st: quail and pinnated grouse, Jan. 1st to Sept. 1st; salmon, April Ist to July 1sti; land-locked sulmon, troot and togue, May 1st to Oct. 1st: black bass, Oswego bass and white perch, July 1st to April 1st following. There are a number of special local provisions. 4. For sale by the Oneida Community, Oneida, N. Y. M. P. Mc., Fanklin, N. Y. Some unorinciped parties in this
- M. P. Mc., Franklin, N. Y. Some unprincipled parties in this M. F. MG, FERRING, N. Y. Some unpuncipled parties in this town, who have some extraordinary poor specimens of cocker spaniels which they breed for sale, have manied them the same names as some of my fine specimens, evidently with the intention to deceive the purchasers of their pure, for by their redigrees one might suppose them to be out of my stock. What is the best remedy in the matter? Ans. There can be no remedy except to make edy in the matter? Ans. There can be no remedy except to make the matter known as thoroughly as you can among your patrons. There is no law to prevent a man from naming his dog anything he may please. Common courtesy regulates these things. If any purchasers of cocker spaniels are doceived through misrepresentations, that is a matter for them to take care of. If you can show any possility injury to your own trade, consult a lawyer. B. Boston.—It is generally assumed that whice, shallow boats will not profit by bailest on the keel. They have, or ought to have, sufficient stability without such aids, and if they have not, their model is an faulty that they durisly would not unspeculous marks.
- Contracting with the distribution of the distribution of the contraction of the distribution of the distri but slight. A keel would, however, make her steer much better, and be easier on her helm. The fault is one of trin, or wrong location of center-hoard, if the model is not extravagant. Changing to jib and mainsail might be advisable, as the eating is the worst balanced of any devised. As an experiment, however, it might be desirable to try weight on keel, though public opinion is against success, but public opinion is loosely formed, and may be in error. We have no data to give a more decided answer. Generror. We have no data to give a more decord answer. Gen-rally, stretching bullast more fore and aft will make a boat less quick "in rough water. A Subscriber, Palmer, Mass.--Please advise me what to do for
- A SUBSCHIEER, Palmer, Mass.—Please advise me what to do for my setter dog. Symptoms are a smacking of his jaws while awake, swallowing in sicep, and making a noise as if his mouth was sticky and champy. He like stretched upon the floor while in sleep, and his legs jerk and twitch. His coat is dry and faded along small of back and sides. Seems very nervous at times, and will start suddenly as it fraghtened, when all is quiet. Appetite is seldem poor. I feed him on scraps from table, Indian meal cake, wheat bread and crackers: there I sometimes give in milk. Ans. Milk should not be given to grown dogs, but buttermilk may at times be mixed with colon. Your dog has worms. As you neglect to give the age of the dog it is impossible to stare the exact quantity of sathorink which we would suggrest you to give; we quantity of santonin which we would suggest you to give; we therefore leave to your indigment to administer two doses, according to age, of from two to four or five grams of santoini in small piece of bread; one dose in the evening on an empty stom-nch, followed the next morning by stodil w dose, and from four to six hours after from half-ourse; to other of easter oil.

PUBLISHER'S DEPARTMENT.

MALARIA DISTROYED.—G. A. J. Gadbois, of Brockville, Canada, certifies that he was prostrated by a malarial disease contracted in Texas, and was quickly and completely cured by the use of Wamer's Safe Pills and Safe Bitters. He adds: "I shall never travel in that climate without your Safe Pills and Bitters as a part of my outfit.—Adv.

Canadian trout anglers should not fail to read the notice of Messrs: Irwin and Clarke, who have built a sportsmen's botel at Mayanetewan villago.

—The Old Judgo who passed sentence upon the particu-lar brand of tobacco bearing his official seal was nover accused of corruption, nor did a jury ever fiul a verdict contrary to his charge.

Notes,-"Wallaco" is mistaken when he says that few clergymen indulge in field sports. There may be few when we compare ministerial gunners and anglers with the whole clerical body, but our experience goes to show that a targe proportion of ministers follow the trout streams and mark down the bevies, and as a class the clergy are as favorably inclined to field sports as are the members of any other profession. We took our first lesson in trouting, one Monday morning, years and years ago, up in a mountain brook, from a man to whose sermon we had listened the previous day. Our correspondence brings us into pleasant relations with many clergy men, who read the Forest and Stream and write for its columns; indeed, some of the best known pseudonyms which appear in this journal belong to ministers. There Good health, cheerfulness, manly is no conflict here. vigor and strength are as desirable in ministers as in laymen. Their acquisition and preservation are not only right from a worldly standpoint, but—unless we very much mistake the spirit of the Gospel-are Biblical as well. He is an unwise clergyman who withholds his sympathy and influence from properly conducted field sports and clubs organized for participating in them. No minister need sacrifice his dignity nor influence by joining a gun or fishing club.

The use of popular misnomers in natural history is by no means limited to America. A writer in the Asian gives a tabulated list of eighty-five names popularly and erroneously given to as many mammals, birds, reptiles and fishes, and this he claims is only a partial list at

"Yell" paints a glowing picture of the attractions of Arkansas. The paper will do to file away for next fall and winter. The mention of Guyon is particularly appropriate, coming with a letter from that person, which we publish. With Reel Foot Lake duck shooting to be had, the Memphis sportsmen might well defy the restrictions of yellow fever quarantines.

This has been a remarkably open winter, and that may account for the presence at this season of the sea serpent off the New Jersey coast. Mem .- Sixty feet long ; dorsal fin eight feet high; color, black and while. A little fellow, nineteen feet in length, alongside. Observed by Captain Maloney, of the schooner Frank Atwood.

THE COLLIE OR SHEEP-DOG.

A sannounced in our issue of reo. 1000, and aminster Kennel Club contemplate inaugurating at S announced in our issue of Feb. 19th, the West-Central Park, a sheep-dog trial on the 30th of April, the day following the closing of the Bench Show at Madison Square Garden. This practical illustration of the usefulness of the collie will undoubtedly be the most interest ing feature of this year's programme; and if properly carried out, as we are assured it will be, will give the in habitants of our cities an opportunity of witnessing the wonderful intelligence of an animal which belongs strictly to the rural districts. All field trials of this kind that tend to display the usefulness of dogs, and the wonderful sagacity of each individual class, do more than amuse and interest for the time being: they teach a lesson and 'preach a sermon of instruction. This is a step in the right direction, and we trust the time is not far distant when water trials for Newfoundland dogs will follow this initial movement. We are thoroughly convinced that the intelligence and capabilities of the variious breeds of dogs outside the sporting classes is not sufficiently utilized, and it should be man's ambition to strike at something higher than making him beg or give his paw. It is the fortunate lot of the sportsman to have proved to him daily the wonderful intelligence of his four-legged companion, and the absolute necessity for him. To one, however, who never leaves his city home, the dog does not command the same respect. If he is small he is constantly being associated with circus trick dogs that affect a pipe, or should he be large, with the unfortunate mongrel that is harnessed to the prowling rag-man's jingling cart. For one reason alone should bench shows then be patronized, for they tend to clevate the dog in the scale of the animal kingdom. Unquestionably the Newfoundland is one of the greatest

favorites outside the setter and the pointer. From early youth his excellent and steady qualities are impressed upon our mind. No child's book or early primer is without his picture, and the variety of occupations in which he figures is incalculable. On one page we see him enforcing a strictly moral lesson by dragging the pilfering school-boy from off the apple tree, while over the leaf his courage is displayed in rescuing a young miss from a duck-pond grave. We grow up to recognize in him all the amiable, generous and domestic characteristics of a fine disposition, combined with a courage and fearlessness that is sure to win man's heart. Therefore, we take it that a race of powerful does of this breed could be very profitably employed at our life-saving stations, and that at times their sagacity, watchfulness and fearlessness would prove of great advantage. How often it is that a ship-wrecked crew almost gain the shore and are drowned in the very face of a shelving beach. dogs could be trained to patrol the beach and give a warning, after the manner that the St. Bernards are trained for the service of the Hospice; while the tutoring to save a drowning person could be easily effected by means of lay-figures similar to those used some time since at the water trials in England. Thus in a short time the honest Newfoundland would have gained for himself quite as romantie and weird a history as his stately brother way up upon the Alps.

But to return to our mutton. The sheep-dog trials were first inaugurated at Bala, North Wales, by Mr. R. J. Lloyd Price, and later on this gentleman gave London ers a treat by bringing a flock of one hundred wild Welsh sheep up to the Alexandra Palace in 1876, the following interesting account of which we extract from the

"Illustrated Book of the Dog," by Vero Shaw:—
Here three sheep were picked out of a flock (which was folded in a remote corner of the park), and were carried to the field of operations on the side of the hill. They were then liberated, and the dog whose turn it was to work them was required to pen them in a small fold situated in the middle of the green bounded by the racecourse. The only assistance the dog received was from his master, who was, however, forbidden to touch the sheep under penalty of disqualification. Those acquainted with sheep will fully appreciate the difficulties of the task thus set the shepherd and his dog, for wild Welsh sheep are very unlike the civilized ones met with nearer towns

To quote further from the account published at the time in the Live-Stock Journal:-"Some of the dogs were so well trained that many spectators expressed the utmost astonishment at the intelligence they displayed. Some of them lie down before the sheep so as to let them recover their equanimity; then they get up quietly, move a step forward and lie down again; this they repeat over and over again, producing a corresponding step of the sheep toward the entrance of the pen, and finally they fairly drive them in, almost unconsciously to selves.

From the above description it will be seen that the collie field trials at Central Park will be properly recognized as an additional feature in this year's show.

Several anonymous correspondents, whose favors would receive attention were they accompanied with names of writers, are respectfully referred to the notice at the head of this page.

-He is sailing under false colors. We hear of him every season; now in the woods of Michigan, slaughtering a deer out of season and then leaving the careass where it fell, because he dared not go to pick it up; again, under cover of official position, yanking out the gravid fish, Now comes the story of his exploits in Maine, shooting the mother swallows over their nests. He is sailing under false colors, because he calls himself a sportsman and when opportunity offers talks feelingly of game laws and the need of more efficient protection for our game There is a well recognized punishment for the master of a ship on the high seas who flies the wrong flag at his top. Sportsmen owe it to themselves to disown and denounce these fellows who rig out under false pretenses.

-A woodcock in full plumage was found clinging to one of the windows in the Grand Central Depot, this city, last Saturday, and recovered by Mr. T. B. Moody, who will have him prepared for one of the decorations of the Superintendent's office.

-Mr. E. W. Messinger, of Boston, has returned from a very pleasant fortnight's quail shooting in North Caro-Mr. Messinger stopped at Tarboro, a thriving village, right in the midst of a magnificent quail country, with a few woodcock and plenty of wild turkeys. route is to Rocky Mount, between Weldon and Wilmington, thence eighteen miles on a branch road. Tarboro bas good hotel accommodations at moderate rates; and the people are among the most hospitable in the land,

-March came in like a lamb; whether or not the old adage will prove true remains to be seen. Spring notes have already begun to reach us from observers in different sections of the country, showing that at least the birds have made up their minds to warm weather.

-The Onondaga County Fishing Club has made itself a power in the land by vigorously carrying out the work for which it was organized, namely, seeing that the laws already on the statute books are enforced. This is altogether a different undertaking from that of securing the enactment of new laws. Let us have other societies es-tablished on such a working basis.

THE SALMON OF ALASKA.

SITEA, Christmas, 1879.

THE mail steamer arrived on the 21st inst, and left on the 22st inst, and left SITKA, Christmas, 1879.

on the 23d inst., and this is the 25th.

You people who live in the world can hardly realize how much is covered in the above paragraph. We here in Sitka, outside of a circle with but a mile's radius, have existed six weeks with as little communication with the rest of our planet as had the inhabitants of Neptuno or Uranus till the arrival of said steamer, with her weekly mail, fraught with good and evil tidings, long looked for hoped for and dreaded, transformed our lives from lethargy to confusion and excitement. And when the dip of her colors as she turned ahead full speed indicated to us that again we were left to our own resources, to hope and pray that another month of our lives would pass away as quickly as possible, a reaction came, and our happiness at the sight of her bow was equaled by that of her stern, For during her short stay we could neither read, cat not sleep comfortably, for while so doing we might be wasting precious moments, during which we might be gath ering in from the carcless utterances of those favored mortals who had just come from the world, and would soon return to it, some bits of news which they might drop. But though we could do nothing else we had to write, for failure to answer during that brief period of confusion, letters just received and hardly understood and digested, made a full month's difference in the time of their receipt-a consummation most evidently to be struggled against

For a full day after her departure I forswore the penand gazed with awe at the immense pile of papers and periodicals I must attack and wade through before I could be even. I filed them all by dates, though, and have before me the task of reading up complete files from Oct. 13th to Nov. 27th. And it is a task in a country where one's reading has to be done by artificial light.

I began, of course, on my FOREST AND STREAMS, and

I have spent my Christmas up to this hour (3 P.M.) in first skimming, and then, for reasons which presented themselves, carefully re-reading your issues from Oct. 23d to Nov. 27th inclusive, that of Oct. 16th not having been received. While so engaged, I have made a few notes in regard to points on which to write you; for I think that I cannot employ my time to better advantage than by giving you, and through you the lovers of natural his tory, a few connecting links between sets of facts preented through your columns by various contributors at different times, and in one case add a little more testimony already given upon the solution of a problem which you say "has been the subject of carnest inquiry and investigation by leading naturalists for the last seven years," viz., as to the identity of the redfish of Idaho, While skimming I was struck by the engravings in your issue of Nov. 13th of the rednsh of Idaho, and ojaculated, "Redfish! Dog salmon!" And summoning some piscato

rial friends, my opinion was confirmed. Then I read carefully the letter of Capt. Bendire. Your foot-note re-ferred back to issue of Oct. 23d; read in it Bendire's first letter and your comments, and am ready to assure you that in saying "from the description above given of the redfish, there seems every reason to believe them identical with salmon, a variety of which are so common in Alaska, as described by our special correspondent there, you were beyond a question correct. The sketch and the description of the redfish fit the dog salmon perfectly. which salmon are in fall very plentiful in all fresh water streams in this vicinity. Capt, Bendire is correct in judging that the hump could have been more strongly portrayed, for I have seen many specimens where the contour line I have drawn on the sketch which I return would more correctly represent the hump. But Lieut. Backus has done wonderfully well, considering the di lapidated condition of the specimen from which his sketch was made. And it is possible that he hesitated to give the hump in all its grotesqueness, fearing that he might exaggerate. But on the other hand, it is quite possible that in his specimen the hump was not more marked. I have seen at the same time and place numbers of the fish with the hump in all its stages of devel opment, from a slight elevation to a bold protuberance And at the same season the fish vary in color from the bright silver of the fresh salmon through varying shades of tarnishing and change until the deep red, and at times purple-red hue of the dogs, is attained, and coincident with this change of color is the change of shape. It is my belief that the entire change is produced by the effect of the fresh water, and is a symptom of the disease by which, after spawning, so many of the fish die. It is so looked upon by those who, at the cannery, become very familiar with the fish. At it all dogs are rigidly tabooed in fact, they are never brought in, for as the seines are emptied, fish by fish, into the boats, poor Indians hover near, and for the aid they render with their canoes receive all of the dogs, and even some, which to my inexperienced eyes would have passed muster, were cast out by my friend Tom McCauley, who manages the fishing branch of the cannery. The Indians claim that when smoked the dogs are better than, the clean salmon, but I can give no opinion on the subject; they depend on the dogs, which they rake out in great numbers from Indian River, for their winter supply of food. I have the resources of the cannery, which I prefer, at my command I spoke of the dogs being caught in the seines; this occurs only at the closing of the season. In early summer none are taken. Mr. McCauley has kindly supplied me with some statistics about the fish, and although in in corporating them in this letter I shall be compelled to repeat some portions of the information, as given in previous letters. I will be guilty of the tautology rather than of omission.

The fish make their first appearance in these waters about the middle of May, and about the middle of June are plentiful enough to start operations at the cannery the "season" lasts from ten to twelve weeks. During this season Mr. McCauly has observed seven different kinds of salmon, all of which are good for canning and for the table ; but two varieties which come latest are the most valuable; the flesh of these is very red and rich with oil. Each of these varieties has a distinct Russian and Indian name (which names I will spare your type-setters).

About the 1st of August the fish begin to make for the streams, and great numbers die in them. The fishing is carried on by means of seine boats, generally in pairs, the boats coming together catch sight of a school-not by seeing numbers of them jumping as I had supposed-but one or perhaps two are in the air at once, and that some times at considerable intervals. The Indians have a say ing that "for one salmon that jumps there are a hundred in the water.

Watching till the school is evidently approaching one of the channels between the many islands, they pull rapidly for the most convenient point, on which one end of the seine is landed, and when in their judgment the school is within reach a boat pulls rapidly around its supposed locality, dropping the seine, which is perhaps a hundred fathoms long and two deep.

There are moments of anxiety as the two ends are drawn upon, but at the first sight of a fish darting across the narrowing space anxiety is at an end. The fish make no attempt to leap out. Indian boat crews buy these seines and outfits early in the season and clear their value (\$300 or \$400) before it is over.

During the last season there were packed 6,000 cases of 24-pound cans, each 144,000 pounds. The largest catch of any one day was 36,000 pounds; the greatest quantity canned, 9,000 pounds; the largest fish weighed fifty-one pounds, and the average weight was twelve pounds.
In the letter of your correspondent "C, R," from Port-

land, Oregon, in your issue of Oct. 90th, several species of salmon common to the coast are described so well that I recognize as Alaska visitors in the order mentioned by him the "quinnat," the "steel heads," the "silver fish," and the dog salmon; but for reasons given I differ with him in pronouncing this last a separate variety.

All of his salmon, though, differ in one essential point from those of Alaska. His will and ours won't, take a fly.

I have given them a faithful trial, and I have a choice sortment of the best flies.

Neither have we been able to induce any salmon, of any variety, to take any kind of bait or lure, and we have tried faithfully trolling and bait fishing—only once with success: In October a salmon ten inches long was caught on a hook baited with venison, which had been lowered for rock cod, over the ship's stern. And I have caused quite a number of "dogs" and of salmon in good condition, just taken from the sea, to be opened, and have never found a particle of food in their stomachs. Upon one occasion only have I had any evidence that they might take a hook, and that evidence was slight. While fishing in a deep pool in Saw-Mill Creek, in which a number of "dogs" were monotonously circling. Lieut. McClellan, who was fishing near me, amused himself by casting his hook, baited with roe, in front of them, but they paid no attention to it for some time. At last, though, he hooked one and it broke his line, but he is not at all sure that the fish bit. In one point only can I de tect any difference between the red fish of Idaho and the dog salmon of Alaska, and that is in the season of their running up the rivers. Bendiro gives this at Wellowa Lake as beginning in July and continuing through Au gust. In the Alaska rivers they begin to appear in Sen tember and continue till late in October.

Study of the letter of "C. R." helps me to another nice little point in natural history. He describes very correctly the salmon trout of which I have caught hushels this summer, but which in September grow very scarce, and in October disappear altogether from our streams. Coincident with our loss occurred "C. R.'s gain, for in the streams near Portland he says they begin in September and continue through October, therefore that salmon trout migrate in the fall to the South, seems to be a fairly deducible result. But again I find a difference, or rather the difference. "C. R.'s" salmon trout take flies, ours will not, nor will ours take any kind of bait but salmon roe, and they won't touch that until it gets to the bottom, and the only way that we can tell when they do take it is by constantly jigging at the line, and if find resistance, overcome it and put the resister in the basket. "C. R." assigns as a reason for the salmon not taking the fly in early spring, the muddiness and height of water in Columbia River and tributaries. That reason won't work here. When the creeks are at their normal height, and the water so clear that the fishes' eyes are visible, they won't touch a fly. Perhaps it's because they have sense enough to know that as there are no real flies here, anything resembling one must be a fraud.

I have one more "note" to use as a text, and then I will give over my task of reviewer. I want to say a few words in regard to the letter of Professor Gill, in your issue of Nov. 6th, and to your comments thereon, letter of the Professor embodies the, at first sight, extra ordinary statement that there actually exist little fish which are not only capable of swallowing much bigger ones than themselves, but which have been caught in flagrante delicto. And you receive his story with so evident an incredulity that, so far as I can find out by read-ing up to my latest number, the Professor has refrained from furnishing you with the additional and promised information.

Now, Mr. Editor, 7 detect in the Professor's letter a little evidence which convinces me that in spite of its ordinary wariness, the Forest and Stream has been "sold." You didn't take notice of one qualifying physics You didn't take notice of one qualifying phrase in the Professor's letter. I did; and in it lies the sell. I back the Professor's assertion, and I think I can in a few words induce you to admit the probability of his story and you can then withdraw your offered prize of a fish-

I will quote from the letter. He says, in describing the small or "outside" fish, that "with its stomach empty, it would have measured less than one inch in height. He omits to give the height when the stomach is not empty. I won't say full, for I don't believe that even the Professor knows the exact limit of elasticity of the stomach of a Chrasmodus niger, whatever that may be, for I don't know that I know the particular fish of which he speaks by the above title; still I may have seen plenty Even the explanation, "one of the gadoids, don't enlighten me much ; for were he to write you a chatty letter in which reference might be casually made to the Bernhardus-cupageris, or the Strongylo-centrolusdrobuchiensis, or the Mya-avinavia, companies, would recognize in the creatures the hermit crab, sea drobachiensis, or the Mya-avinavia, comparatively few don't, I know one-yes, several-which I think will fill the bill. I will throw out of the question certain of the radiates which, when preparing for a good dinner on say an oyster considerably larger than themselves, protrude their stomachs, and with them outside of their bodies envelop and digest the oyster at leisure.

There is found in the waters of the Gulf of Mexico a fish termed by sailors the "drum fish," from a sound which it emits, similar somewhat to that of a muffled

This fish, by inflating its abdominal sac, becomes nearly spheroidal in shape; and when in this condition, with its stomach not empty; the height from top of back to

lower surface of belly is over two-thirds of its length.

The common toad fish, when taken from the water, is of a normal shape, but scratch its belly and what a metamorphosis takes place. I might multiply instances, for I have seen fish in China, Japan, Africa, South America and Alaska waters whose power of swelling the stomach is so great that I could readily believe them capable of performing the feat of the professor's "gadoid." And any one who has examined the telescopic joints both at the inner angles and at the center or chin of the Laphrus americanus (goose fish), can see that jaws so furnished would admit of a wonderful amount of expansion.

This letter is hardly an Alaska letter, but I cannot but think that in piecing together the various items which have appeared in your columns, I have served your paper equally as well as though I had described to you in the orthodox manner, "struggles of speckled beauties

A DUCK STORY FOR "PISECO."

CHELSEA, MASS., Feb. 14th.

Editor Forest and Stream .—
Reading the spicy letter of your correspondent, "Pisco." has twening, recalled to my mind my first duck in South Carolina. In the spring of 1863, a boy of fifteen years, I found myself in the service of Uncle Sam. I held (when not being punished for some boyish prank) the responsible but not lucrative position of messenger boy on board the iron-clad monitor Nantheck, just are boy on board the iron-clad monitor Nantucket, just arrived in Port Royal harbor. Going on deck the first morning I was surprised and delighted to see the number of wild fowl in the harbor. One large flock in particular, about four hundred yards to windward of us, drew my attention as I saw a small sail-boat maneuvering to get within range of it. After a while the occupant of the boat concluding he was near enough, "let go" both barrels, killing three birds instantly and badly wounding another who flew straight at our ship, dropping in the water at about fifty yards to windward. I was intensely excited at this, for I had been an enthusiasiasite sportsman at home, where I had left a fine double-barrel and a knowing young spaniel. Grasping a few pieces of coal han at none, where I had rea a me double-carrier and a knowing young spaniel. Grasping a few pieces of coal lying on deck I immediately opened fire, and at the third or fourth shot hit the duck on the head, turning him over on his back; when as he floated past the ship I se-cured my prize. What to do with it now that I had or fourth shot hit the duck on the head, turning him over on his back; when as he floated past the ship Isecured my prize. What to do with it now that I had secured it was a problem. I was no favorite with the sable genius who presided over the ship's galley, and without his permission how was I to cook it? While pondering over my dilenma, the lieutenant passing said, "S., what have you there?" "A wood-duck, sir, won't you accept it?" For I wanted some one to get the benefit of my shot. "Thank you!" said he. Turning to the steward, "Steward, have this cooked for my breakfast to-morrow." "Yas-sar," was the reply, and the duck the steward, "Steward, have this cooked for my orear-fast fo-morrow," "Yas-sar," was the reply, and the duck was faithfully and scientifically done. Our navigating officer was a bluff "old skipper" from the merchant ser-vice, who also acted as caterer of the ward-room mess. Now, among our officers was a young ensign named Starr, who always insisted that the caterer had reserved Starr, who always insisted that the caterer had reserved sundry dainties upon which he was in the habit of lunching during the long hours of the mid-watch, and as fate would have it, this night in particular he was determined to find the secret store of goodies. During his watch that night he cautiously rummaged the ward-room pautry and was rewarded by finding a nice lunch covered by a platter. Taking it on dock he proceeded to demolish the same, mumbling his elation between the mouthfuls. So pleased was he with his joke on the caterer that the next morning he related the story to the whole mess. Shortly after, at breakfast, the lieutenant, with a smile that was child-like and bland, said to the steward: "Steward, bring on my duck." The platter was brought and uncovered by the steward, who turned almost white with horror on finding nothing but a small lot of welland uncovered by the steward, who turned almost white with horror on inding nothing but a small lot of well-picked bones. The smile faded from the licutemant's face; a frown began to gather, when, happening to catch the eyo of the ensign, heremembered the story of the midnight forage. The whole ness saw the point at once, and cuch a shout of laughter followed. Long years have passed since then; the gallant licutemant now signs himself as "Pisco," and writes entertaining letters from "Sitka," If this should catch his eye and he remembers what "tremendous grins" distorted the visages of the foremast hands, this will inform him that the said grins were caused by the ward-room steward relating this story to a select circle of "old shellbacks" around the Story to a select circle of "old shellbacks" around the stack that evening.

GAME PROTECTION.

MIGRATORY QUAIL IN PENNSYLVANIA,—Northumber-nad, Pa., Feb. 24th.—About the middle of this month a ovey of five migratory quail was seen three miles from his place. Although it is contrary to their habits to rethis place. Although it is contrary to their habits to remain here over winter, yet this season has been a very open one, and they might not have migrated in the fall. They were seen in the early part of the season by the gentlevan who located them in the spring about the same place. Our informant is a sportsman, and reliable, yet he never had an opportunity to examine the migratory quali closely. He describes them as being much smaller than our native quali, and very swift flyers. We located six pair here last spring, but not much was heard of them, as we did not look after or try to disturb them.

BOSTON'S PAMOUS WOODCOCK,—Boston, Feb. 26th.—
Several months since, at the instance of the Society for
the Protection of Game, was instituted a complaint against Hall & Whipple, proprietors of Young's Hotel, for laving in their possession woodcock within the ses-son prohibited by section 1 of chapter 200 of the General Statutes. It appeared in evidence that the defendants served a woodcock to aguest and received payment there-for, and it also appeared that said woodcock was not killed, taken or caught within the limits of the Commen-wealth of Masses used to the control of the Commenwealth of Massachusetts, but was taken, caught or killed in the State of Pennsylvania, at a season and time when it was lawful by the law of that State to take, catch or

kill woodcock, and was dead when brought into this Commonwealth. On this ground the defendants asked the court to direct a ventlet of not guilty; and further asked the Court to rule that the defendants had not committed any offense under the laws of the Commonwealth. But the Court declined so to rule, and instructed the jury, as matter of law, that the defendants were liable under the tast the actual to the statute aforesaid, and directed a verdict of guilty. The defendants excented and the case was arrued be.

The defendants excepted and the case was argued be-fore the full bench of the Supreme Court, which to-day

fore the full better of the supreme court, when the following rescript:

Exception sustained. Verdict set aside and a new trial ordered. The defendants are not punishable under the statute 1789, c. 209, for having in their possession, offerwards the statute transfer of statute 1789, c. 209, for having in their possession, offering for sale and selling a woolcock which is admitted to have been lawfully taken or killed in another State.

This is the loophole of the law, through which innum crable woodcock may pass despite the earnest work of the Society's officers.

The New Jessey Law.—Morristown, March 1st.—Editor Forest and Stream:—I notice in your issue of Feb. 26th, the communications of two gentlemen replying to my letter on the New Jersey Game Law. A careful perusal of these letters fails to reveal to me where the views of your correspondents differ materially from mine. "Fair Play," in his letter, says: "Of the half-dozen bills before the Legislature, there is but one that deserves consideration, and that is Senator Beekman's bill, problibiting the shooting of game birds and rabbits from Jan, 1st to Dec, 1st." If "Fair Play" gives the woodcock a place on the list of game birds. Where the view of your plane is the consideration, and that is Senator Beekman's bill, prohibiting the shooting of game birds and rabbits from Jan, at to Dec, 1st." If "Fair Play" gives the woodcock a place on the list of game birds then he would carry the abolition of summer shooting beyond anything I had contemplated. But the inhabitants of the northern counties would be left out in the cold, both figuratively and literally, were the killing of woodcock prohibited until Dec, 1st, or even Nov. 15th. In most winters we are blessed with an abundance of "beautiful snow" long before Dec. 1st, so that if any woodcock had the courage to stay through one of our storms, it would not afford much pleasure to wade through snow-drifts in pursuit of the festive timber-doodle. And yet "Fair Play" cries against "one section of the State attempting to legislate in their own interest and against another section."

Your other correspondent, "W." agrees with me in every particular, for he writes: "If Jersey can prevail on Senator Lawrence to lave this old law repealed, I have no doubt that he will find very little opposition to his bill." As you have stated, it is entirely unnecessary to take any such measures, as the old law referred to was repealed by the act of 1874.

Game Bag and Gun.

GAME IN SEASON IN MARCH.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcook, Quali, Snipe, Ducks, and Wild Fowl,
"Bay birds" generally, including various species of plover, sand
piper, snipe, curlew, oyster-eather; surf birds, phalaropes, avocets, etc., coming under the group Limacotte or shore birds.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory to The sending reports for the choice and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value: State, Town, Country; means of access; Hole and other accommodations; Game and its Season; Fish and its Sea con: Boots, Guides, etc.: Name of person to address,

-Ducks are now flying at Good Ground, L. I. Don't

A BED FOR THE CAMP.—Warsaw, Ind., Feb. 23d.—I am an old camper, and have experimented in many ways, and through many contrivances, to obtain a comfortable night's rest in camp, but as yet have not succeeded. I would be pleased to have some of your correspondents suggest a bed that can be carried in a small compass, yet strong and comfortable.

H. Z.

The camp lounge, advertised elsewhere, is well spoken of by those who have tested its merits. The hammock is also a comfortable bed after one becomes accustomed to it. Some campers simply provide themselves with a huge bag of canton flannel, or, in cold weather, of duck, lined with wool, into which they crawl, and then lie down on the softest spot on the ground. This is particu larly convenient for horseback travelers, being light and compact, and serving as well for saddle-bags. As a bed, it keeps out vermin and cold at the same time. There are many forms of home-made beds and bedsteads for use in the camp. One can readily construct a light framework, which may be carried in a compact bundle and put together in the woods. The bed in these should be of canvas or duck. One of the simplest things of the kind ever coming to our notice was a sheet of canvas six feet square, folded over and sewed together along two of the edges, forming a bag six feet long, three feet broad and open at both ends. Through this were run two poles, which rested at either end on logs or in forked stakes. This formed a cot; and if greater warmth or softnes were desired, the bag was used as a mattrass and filled with moss or leaves. A camp bed is largely the result of individual ingenuity; perhaps some of our readers will comply with the above request, and describe the beds used by themselves.

NEW GUNS .- Wo have been permitted to examine some samples of new guns sent to Mr. Henry C. Squires, of Cortlandt street, by W. W. Greener. The first is a new gun, of which Mr. Squires is sole agent for the United States, called "The Club Gun," which name is en-

graved upon the rib, and is to be also put upon the heelplate. Mr. Greener will maintain in these guns the reputation which he has established as a first-class maker, if the one we saw was a sample. It has the favorite topaction, double bolt and extension rib, pistol grip and patent fore-end, and the hammers, when cocked, are entirely below the line of sight. The barrels are lamina-ted steel, perfectly straight so far as can be seen with the eye, and choked on the best principle, and it is represented as being an excellent shooter. What pleases us greatly is the balance of the gun, not being, as are so many choke the balance of the gun, not being, as are so many choke bores of inferior make, top or muzzlo-leavy. The price is fixed at \$85, bringing it within the means of the masses, and must be based on large anticipated sales. The next gun is the Treble-wedge Fast, with hammer, having Mr. Greener's cross-bolt, which he claims as the strongest action made. There is nothing special to note in this gun, further than that the piece is much lower than ever before advertised in our columns. The gun that interested us most was the Hammerless Breediloader, and we are glad to know that these guns are now brought down to a price where they interest a large mass of sportsmen who have not felt like investing what has seemed like a fancy price in a gun. This subject of hammerless guns is becoming of so much interest to sportsmen that we purpose shortly giving some some further attention to the subject. In England the hammerless is fast superseding all other kinds, and all the principal makers are now building them, applying to them their is fast superseding all other kinds, and all the principal makers are now building them, applying to them their own system of action, etc., and so far we have been un-able to learn of any dissatisfaction being expressed with them when brought to a practical test. We would be them when brought to a practical test. We would be glad to hear from those how using them, as to whether they find any serious objections, and how they could be further perfected, as we are well satisfied, from their simplicity and strength, and the rapidity with which they can be fired, that they are the coming gun, or, as Mr. Greener states it, "the gun of the future."

New York—Lowville, Feb. 19th.—I recently received a fine large raven (Corvus corax) killed while flying over Round Pond at Stillwater, Beaver River, by one of Duntar's guides. Last week I got a very nice dark otter, caught by Johnnie Beach at Beach's Mill on Burnt Creek. Both of these specimens I have added to my collection. By the way, Beach said that he set two traps in a spring, and a mink got in one and the otter in the other. The otter laid all the blame on the mink and tore him all to viaces in his race. Prefix good success for a markey. pieces in his rage. Pretty good success for an amateur trapper. H. W. HAYT.

NEW YORK—Hornellsville, March 1st.—A woodchuck was killed here Feb. 19th. A large panther has been seen several times within the last two weeks at Canaseraga, ten miles from here.

aga, ten miles from here.

FIRST SNITE.—Philadelphia, Pa., Feb. 28th.—Yesterday Mr. James Adams shot (as far as we can ascertain) the first snipe of the season. He took his old bitch and young dog Ben for a stroll down the meadow, taking his gun along. When he arrived on the meadows off South Broad street, below the Greenwich railroad, Ben came to a stand, with the bitch—the mother of Ben—backing him. Mr. Adams at first did not think the dog was standing a bird, but when he found the bitch backing he took another view of the matter, got himself in working order, and flushed a very fine bird, killing it. The bitch retrieved the dead bird. This is the first snipe the dog ever saw, and Mr. Adams is more than proud of his dog, which promises to be a good one, as it is only just a year old. C.

SCOTTDALE SPORTSMEN'S ASSOCIATION.—Scottdale, Pa., Feb. 24th—We have organized an association at this place to be known as the "Scottdale Sportsmen's Association," organized on Feb. 17th, with H. B. Orr as President; B. F. Hubbs, Secretary: J. W. Arnholf, Treasurer; S. K. Dunkle, Jno. Wright, E. A. McConn, Thos, Bally and W. N. Porter, as Directors. Our association bids fair to prove successful, having taken in twenty-two members on the 19th inst. We are located within fifty miles of the Alleghany Mountains, and within ten miles of Laurel Hill Ridge. The Youghiogheny River, five miles distant, is well stocked with black bass and salmon. A great many deer and turkey are Killed on the Alleghanys and Laurel Hill, also some fine black bears. Grouse and quail are wonderfully plenty in the immediate neighborhood.

BELLWARE QUAIL SHOOTING—Philadelphia, Pa.— SCOTTDALE SPORTSMEN'S ASSOCIATION. -Se

DELAWARE QUAIL SHOOTING-Philadelphia, Georgetown, Delaware, is a good point to gun for quait. It is reached from Philadelphia by P. W. & B. R.R. and from New York by the O. D. S.S. Co. Quail season begins Nov. 1st and expires Feb. 15th, Brick Hotel; first-class accommodation, with teams if desired. I have been going every season for past fifteen years.

EDWARD MAHER.

TEXAS-Galveston, Feb. 14th .- On account of scarcity of rain the shooting has not been as good as usual this season. Ducks are not abundant, and jack-snipe scarce C. C. P.

INDIANA—Washington, Feb. 25th—Hunting in this vicinity has been very slim this winter. Quali all froze out last winter. Dr. Harned and W. D. Bynum, of this city, went about seven miles west of this place, one day last week, and succeeded in bagging twelve ducks. Dr. Jones, Dr. Lacy and W. D. Bynum have ordered three new breech-loading shot gans. We are having a very mild winter, and several of our fishermen went out one day this week and captured fourteen bass.

M. B. RILEY.

WYOMING SHOOTING CLUB PRESENTATION.—Cincinnati, Feb. 28th.—Among the clubs in this vicinity the Wyoming Shooting Club stands at the head for real enterprise. Whether individually or collectively, this club is not excelled at the trap or in the field. Of all the twenty-five members there is none more enthusiastic and no one held in higher esteem by his fellows than the Rev. Jos. Gamble, of the Wyoming Presbyterian Church. Possessed of good social qualities, excellent unbit ability. no one neid in higher esteem by his fellows than the Rev. Jos. Gamble, of the Wyoning Presbyterian Church. Possessed of good social qualities, excellent pulpit abilities, and a full share of good common sense, he combines all these with a great love for the rod and gun, the field and the stream, making him one of the truest of true sportsmen. After a residence of eight years in his

present location, he now leaves a host of friends and removes to Plattsburg. N. Y. A few evenings since, some of his companions in the field met him at the residence of Edw. Mitchell. Esq., and were nost royally entertained by Mr. Mitchell, than whom no more clever sportsman ever shouldered a gun. A glorious supper was provided, to which the forest, field and stream had paid literal tribute, after which an elegant repeating riflo was presented to Mr. Gamble, as a token of remembrance from the little company of friends present. The presentation speech was made by Hon. Judge Harmon, who, being an expert with the rifle, aimed directly at the heart and made a "good clean hit." Mr. Gamble, taken entirely by surprise, accepted gracefully and responded, extending a hearty invitation to visit him in his new home, where his friends would always find the "latchstring" on the outside. The hours went swiftly by as many happy experiences in the field were related, and as g" on the outside. The hours went swiftly by as y happy experiences in the field were related, and as good man's friends reluctantly said farewell, it was the wish that his good example and induced raight it in the nan trianglating here. be felt in the new friendships he will form as they have been in those he leaves behind, and all expressed the hope that they might often meet again in the forest and in the field and hear the familiar music of his faithful "Parker" and the echoing crack of his handsone new

I mention this incident as encouraging to those who I mention this medical as encouraging to those who are interested in the elevation of those pleasures in which the true sportsman finds so much enjoyment. Few ministers of the Gospel know anything practically of the pleasures and benefits, physically or mentally, they would gain by engaging in active exercise with the rod and gun. This lack of knowledge is accounted for to some extent form the four they in the minks of many and gun. This lack of knowledge is accounted some extent from the fact that in the minds of some extent from the fact that in the minds of many good people there is a prejudice against ministers engag-ing in such sports, which is caused by the abuse of these sports by many who are not true sportsmen. The influ-ence of a club conducted on correct principles does much toward destroying this prejudice against the most health-ful of all recreations. Just such a club is the largest elective club in this legality, whose meetings and unbitic toward desiroying this prejudice against the alons heating and full of all recreations, Just such a club is the largest shooting club in this locality, whose meetings and public matches are attended by ladies and gentlemen who neither see nor hear anything in the least objectionable. There are many such clubs now, and the number is rapidly increasing, as there seems to be a growing interest in that direction among argasional and actival unsiness. that direction among professional and active busines men who realize the need of some healthful recreation. active business

RECOIL PADS.—While the subject of recoil pads is up, I want to say a word in indorsement of what you have said of Ritzman's pad. It is a very ingenious and tasteful contrivance, and a great counfort to one who shoots heavy charges. I am using one on a 7-gauge single-barrel gun weighing 74 pounds, with 7drs. F. G. powder and 14 ounces shot. The recoil, even of so light a gun, is not umpleasant, while the power is unmistakable. At 60 yards, 0 shot go through seasoned inch pinc boards like bullets and reces that cet in the way fare next when bullets, and goese that get in the way fare pretty much like the boards. Without the pad I would not like to use over 5drs, powder with it. I get execution that I never got from a gun before. The pad can be removed from my goose gun to my 12-gauge in a moment and fits either equally well. Gunners that need a pad for recoil need not fear a mistake in getting this. BOOM.

PATTERN AND PENETRATION.

OHEBEC, Feb. 24th.

Editor Forest and Stream:— QUEBEC, Feb. 24th.

I see many persons in your columns giving their experience in the shooting of their guus. Some are better; some are worse; but all of them give only the particular gun they use themselves. In the subjoined table you will find some trials that I have made myself, and with different guns of various makes, and as a list of trials I think they will compare favorably with any that I have seen in your paper. I may say that all the guns had one or both barrels full choked, some of them one barrel medium. This can be seen by the targets. I was most particular in all my trials to give every gun an equal chance. The gun was wiped out after every shot, so that every one was clean for a second trial. I used No. 7 Canadian soft shot, I do unces to charge; and just here allow me to say that there is a vust and unexplained difference between the size of Canadian shot and the same number made in the States. In the columns of your paper some time ago you gave the number of pellets to the ounce of American shot as from 219 to 290, according to the maker, or, in other words, from 317 to 362 grains to the charge of 14 ounces. In 14 ounces of Canadian shot there are, by actual count, 405 pellets, or 370 pellets to the ounce. Of this I am positive, as I was struck by the great difference, and I opened several new bags of this size as it came from the manufactuier, to see if there was any difference in that way, but found none. I then weighed my onnee on a fine postal balance, that would balance by a pellet, then counted it, and in every case I was within two or three pellets of the same number—370 pellets. This difference in that mumber of pellets will account for what are seemingly very large targets, according to American standard of number of pellets will account for what are seemingly very large marked by the Windsor Mills Powder Company, near Montreal—a powder that burnet quick and moist. It was rather coarse grain, and I used 4 drachms, weighing in every histance 273 grains to the

everything more Considerable and the sequal in this respect.

The shots were fired two at each pair of targets, and the targets marked and numbered for future reference. These targets I kept, and can show them if required. Nearly all the guns were of different quality, and in the English list, with the exception of one, all were of very high quality. These guns were notually tried by myself, and reould have increased the number of makers, but English list, with the exception of one, at most an including the high quality. These guns were notually tried by myself, and I could have increased the number of makers, but did not think the guns I could have got suitable for the purpose, as some of them were cylinder bore, and it would be absurd to pit them against the choke-bores in a trial of targeting. All the shells were loaded with one hard and one Fley pink-edge wad over powder and one

In brass shells wads two gauges pink-edge over shot.

pink-edge over shot. In brass shells wads two gauges larger than shell.

The guns used were:—Remington, ordinary make, factory price, \$65; Fox, fine quality, price, \$150; Nichols, fine quality, made to order, \$150, full choke; Parker, ordinary make, factory price, \$75; Baker, ordinary make, factory price, \$75; Baker, ordinary make, factory price, \$16; W. & Powell, fine gun, full choke, \$225, hammerless; W. & C. Scott, fine gun, right barrel full choked; Greener, full choke, fine gun, right barrel full choked; Greener, full choke, fine gun, see full choked; Greener, full choke, fine gun, see full choked; Greener, full choked, full choked, Tuby, full choked, Tuborough, ordinary quality, full choked; I cluborough, ordinary quality, full choked. I used brass shells with the Rennington, Nichols and Scott; with the others paper shells; loading in all cases with dirs, powder, I lozs, shot. The paper shells of American make are fully equal to the English in every way, and I think a trifle less expensive, are ahead of the English in everything but cheapness, and I suppose the difference in price accounts for the

NEW HAVEN GUN CLUB.—New Haven, Conn., Feb. 26th.—On Feb. 233, being a holdar, there was to have been a big shoot on the club grounds; but owing to the unpleasant weather in the formon, and the wind blowing perfect nurrieme in the afternoon, there were but a very few present. The great feature of the day, a match between Howard and Sanford, which had been the topic of conversation every evening at the club-room by their frien did not come off, Mr. Howard not being present, owing to sick-

that not come on, ar. Howard not being present owing to sea-ness in his family.

At 3 r.m. the members present shot for the gold club badge from the Card trap; 20 balls. The scores were: Jorcy, 12; Folsom 15; Armstrong, 9; Hansen, 14; Calvin, 15; Beers, 9; Langdon, 16: 16) Armstrong, y. Hangdon, M. Cauvin, 16; Heers, y. Langdon, in Fronson, 10. Mr. Langdon won the badge shoot Beers and Sanford shot a match from the Card trap. After a load and hardly contested match Sanford won by two balls. Consider-ing the perfect hurricane that was blowing, their score was ra-markably good. As they secured the score we are unable to give it.

Long Island Gun Clun.—Derler Park, L. I., March lst.—Match at 7 birds each; handicap rise; 80 yards boundary; 14 ounces of shot; from 5 ground traps; for a gun valued at \$100, to the best shot; 330 shells to the second best, 200 to the third, and 200 to the fourti, ties decided at 3 birds each; miss and go out. The follow-

Ties for leather medal:-Two interesting instense were shot on the grounds or the derivy City Heights and the New Jersey Gun Cliuds, besides numerous sweepstakes. The day proved anything that favorable for good scores. A very strong wind, with frequent squalls of smow and clouds of dust, bothered the marksmen greatly.

The first match was a find, handle and trap match between two

The first match was a find, handle and trap match between two members of the New Jersey Gun Club, 25 birds each, 21 yards rise, one barrel, for \$55 a side. And here we wish to put in our emphatic protest against these trap and handle matches for money, as they are conducted at present. Whore money is at state the shooters and their immediate friends seem to drop, for the time being, all the finer and better feelings of their nature. Their hearts become callous, and every nerve seems strained to win at the sacrifice of everything else. A more outrageous exhibition of cruelty to dumb animals was rarely witnessed, even in olden times, when such things were tolerated, than was to be seen near West Driving Park on last 23d of February.

Two men calling themselves sportsmen would doliberately

every time approach the trap, and while one cut or bit off the enevery time approach to trap dara while one or bit off the en-tire rump of the bird, the other applied to the raw and bleeding part is the oil or essence of cayenne. The poor suffering creatures are the placed in the trap, and of course when released in the agony of its making a hard bash of the other shooter. This sys-light, thus making a hard shot for the other shooter. This sysnight, thus making a hard shot for the other shooter. This system of plucking feathers, putting pins, etc., into the body of the birds, or sticking cont-plaster over the eyes—the right or left eye, as the trapper wishes the bird to fly—is not only abominable, but it is helious, and we would send up for a long term such perpetrators as soon as we would for shooting or arson. We are glad to put that this may only the contribution. trators as soon as we would for shooting or arson. We are glad to say that this was only the act of two men, abetted, perhaps, by a few others who had money on the result. The two clubs, the New Jersey and the Jersey City Heights, were strong in their condemnation of the whole affair, and members of both clubs declared that no such disgraceful scene would over take place on their grounds, or be tolerated by any member of these clubs

again.

As usual, the best shooter, but the merciful man, was outbirded in the match—that is, mutilation, oil of cayenne, etc., won.

The following is the score:—

urer and the Achilles of the club went his bottom schooner on Will. T. The pools in the club-room for a number of days previous have fluctuated somewhat; but the banker had the cull decidedly. Yan had the reputation of more experience at the trap, and was therefore considered more reliable; but had he the staying powers? There was the ruo.

The match was 10 birds each; 25 yards rise; 1 barrel; for a first-

and was therefore considered more reliable; but had be the staying powers? There was the ruo.

The match was 10 birds each; is yards rise; 1 barrel; for a firstclass sportsman's clock for the club-room. Heritage furnished
the birds, and they were hummors. F. Thompson pulled the traps;
Dr. Burdett acted as umpire, referce, ludge, etc. Will. T., first on
score, cut down a left diver handsomely. Then the crowing commenced. Van G. had a similar bird, but owing to nervousness falled
to score. Will. next killed his bird neatly; more crowing. Vair
came to the scratch somewhat demoralized, and the bird proving
a lightning calculator, falled to communicate. Will, then had a
streak of lightning, and saw all the feathers go oft together; but
his did not seem to quie! Van's nerves, for he overshot his next
bird. Of course more courage for Will., and he grassed his biped
through a long shot. More crowing on the part of Al. H. and
friends. Van seemed to be completely demoralized, for he missed
a comparatively easy bird, making 4 goose eygs to Will's. I. The
next bird for Will. was a tough one, and he didn't ruthe a feather.
The next for Van the same. Will, then had a fair bird and missed.
This seemed to give some courage to Van, for he made a magnificent shot on a blue rock, going down wind at the rate of sixty
miles, more or less. And here is where the banker comes in.
Thinking his man might be out-birded, and judging that Al. had a
private basket of twelve or thirteen birds therein that were old
stagers and "hard of find," he slipped and pudging that Al. in all
a private basket of twelve or thirteen birds therein that were old
stagers and "hard to find," he slipped and pudging that Al. in all
a private basket of twelve or thirteen birds therein that were old
stagers and "hard to find," he slipped and pudging the casiest
of shots to Will., who did not fall to take advantage of the same.
Will, the to the astonishment of the few in the secret, the bird
only hopped up on the trap, and then deliberately spread its wings taste, the club may well congratulate themselves on the prospect

taste, the club may well congratulate themselves on the prospect of a valuable ornament to their fine rooms.

The whole affair was heartily enjoyed by all; and now Will. T, wants it distinctly understood that he is no duffer, and is ready to shoot the best man in the club.

The following is the score; 10 birds; 25 yards rise; I barrel; usual

rules: for a clock :-

| | | | | | | | | | | Killed. | Missed |

The boys are expecting a good time, as well as a close one, with the Essox Club, on the 10th inst. As it is pretty well known that the latter club have been adding largely to their number lately, among them some of the best shots in the State, the J. C. H. will have to do some very fine work to win.

New Jersev-Matawan, Feb. 27th.-The first shoot of the Mount Pleasant Glass Ball Club took place here to-day on their grounds at Mount Pleasant for a badge :-

| A DASTARDLY OUTRAGE.—Editor Forest and Stream:—The Rhode Island Legislature has just put its little foot on pigeon shooting, and though I'm an old sportsman I'm glad of it. I doubt whether, in the aggregate, the birds suffer any more by being shot than by shuffling off their mortal coil by nature's process; but I'm heartly tired of these boylsh single-bird contests. It is no test of skill in shooting; good nerves and constant practice will enable almost any man to make a good score. Considering it in the light of crucity it is noble and human in comparison to the "beastly" deeds that I heard of in Maine last summer. Certain parties who disgrace the name of sportsman used to go, for practice, to a swallow bank and shoot the old birds, leaving the young ones to die by the slow, gentle death of starvation. It seems incredible that anything calling itself a man can have so small a soul, but so it is, and the proper place for such a thing is the penitentiary. The writer of the above has a right to the expression of opinion he has written, for he has before now scored his 25 out of 30 birds, double rises. Single bird shooting is, however, difficult enough for many. | General fine of the second of |

| RANGE AND GALLERY. | sho |
| MASSACHUSETTS—Boston, March 1:t—Mammoth Rife Gallery.— The fifty dollar rife match, for the month of Pebruary, is ended, and has shown the most remarkable shooting ever done in the gallery. Mr. N. Wilder has made five clean scores and takes the extra prize of \$20 for the same. Mr. E. P. Richardson has made four clean scores; Mr. W. H. Harrison has made three clean scores, and Mr. J. Merrill has made two, and Messes. Hollis and Walters have made one each, making in all sixteen clean scores during the match, which out-ranks the January match, which had ten clean scores. All of the above gentlemen are members of the Massachusetts Rifle Association except Mr. Hollis, and he is a member of the Massachusetts Rifle Association except. The month of March the | mar The scon low D. I J. C E. (S) mac win |
| management offer a new match called the Consolation Rife Match, with \$70 in eash prizes, divided into two classes, as follows: All who have ever won a prize in the gallery to be in the first class, all others to be in the second class. The prizes in the first class are \$10, \$7, \$5, \$5, \$2; in the second class there will be six cash prizes of \$5, \$5, \$5, \$2. \$21; also an extra prize of \$20 for any one making the highest number of clean scores during the month. The conditions of the match are as follows: The match to continue through the month of March, and no competitor in the first class can shoot in the second class; and no competitor can receive but one cash prize, except he may win the extra prize for the highest number of clean scores. During the month the match is open to all comers. Any. 22 caliber ritle; shots eight; position, off-hand: trigger, three-pound pull: the three best scores during the | L. I. S. S. J. E. G. I. S. H. ONNECTICUT.—Collinsville, Feb. 25th.—Canton Rod and Gun b. Practice meeting at 200 yards, off-hand, with left arm exled; 3lbs. pull :-

Hew Haven—Phankr Rifle Gallery,—The attendance during the past week shows that this new rifle gallery is becoming more popular. The new metallic cartridge, introduced in the early part of the week, for military rines, is meeting with great favor among military men, the majority of those who have used it being very well pleased with the result obtained. It shoots with perfect required at the contraction of the works of the contraction of the contr among military men, the majority of those who have used it being very well pleased with the result obtained. It shoots with perfect accuracy at a distance of seventy-five feet, with a charge of 3 grains of powder and 139 of lead. If arrangements can be made, team shooting will be introduced among the different military companies, for suitable prizes, with this cartridge. One new feature added to the Gallery, by the request of one of the members of the International Team of 1536, is bullet practice, 50 caliber round bullets being suspended by a thread at the end of the Gallery, instead of the regular target. As many as 'eight out of ten have been hit by some of the crack-shots. In the All-Comers' Match for, the gold badge, Evalue twenty dollars, some brilliant scores have been made. Mr. E. J. Watrous, of this city, heads this list with a straight 50, being closely followed by several heads this list with a straight 50, being closely followed by several 49s, the scores standing :-

NEW YORK RIFLE CLEB.—New York, Murch 1st.—The New York Rifle Club, owing to some unforseen reasons, only had five men out on Wednesder, who made 1,393 fring target), 281-3-5 average, and 63-2-5 average for Creedmoor count, A. J. Howlett Incilling with 70, Creedmoor, and 315 ring.

Mr. A. H. Cobb was the winner in the special match Saturday evening, Peb. 28th; score 118 in a possible 125, the highest score ever made is the gallery with five shots on ring target.

ever made in the gallery with five shots on ring target.

THE MAYMARD RIFLE.—A Boston correspondent who shoose the Maynard riffe writes:—We wish to have it understood that the Maynard riffe; is a safe one to use. You have probably received the account of the splendid shooting done by Mr. E. P. Richardson on the 28th of January in the Mammoth and Magnolia Shooting Galleries in Boston, making three full strings of eight shots each, 150 feet, all bull's-eyes, and one at 100 feet, winning 876 cash, together with an additional \$15 if the scores are not beaten during the month of January. You may not have been informed that this shooting was all done with a Maynard, 22 call, but such is the fact, and also the splendid scores made by O. M. Jewen, alias J. A. Mattoon, alias J. Merrill, are all made by the Maynard, and many other members of the Massachusetts Riffe Association use it also.

AVERAGES FOR 1879.

UXBRIDGE CRICKET CLUB.

TEMBRIDGE CRICKET CLUB.

This Canadian Club was organized several years ago, and owing to mismanagement had greatly fallen off, but during the past season the members seemed determined to make an effort to retrieve their fallen fortunes; and looking over the scores and analysis, they show that they succeeded well. During the season eleven matches in all were played, of which, eight were foreign and three home games. Of the foreign matches, five were won and three lost, and the bachelors were victorious over the Benedicts in two matches out of three. Through the kindness of the Club's Secretary, Mr. Edwin R. Kogers, we are enabled to give the following comprehensive report of last season's play:—

| Date and Place. Stdes. June 6th, at Ux-) Uxbridge bridge | First Innings. | Second. Innings 18 (2 w) 52 | Total, 80 87 |
|---|-------------------|--------------------------------------|--------------------|
| June 17th, at Ux- Uxbridge bridge Whitby Lost by 99 runs. | 94 | 39 136 | 133 232 |
| For Whitby, S. Ray contribute | d a splendidly | r made 74, s | and H. |

For wintey, S. Imy contributed a spending made 13, and 11. Carrettin good 35. For the home club, L. Cassells, 23, and L. Hemp-hill, 21. The bad defeat was owing to the loose fielding of the hill, 21. The home eleven.

For Uxbridge, E. R. Rogers bowled 7 wickets for 6 runs; aught one, thus helping to dispose of nine out of the ten wickets.

L. Hemphill, for Uxbridge, who carried his bat for 62 runs.

For Toronto, Logan and Behan did good execution with the

Names E. R. Rogers. 11 J. B. Gould 13 L. Hemphill 15 10 Answer to "A Member of Many Clubs."-New York, Feb. st.—The contribution to your Issue of Feb. 19th, by "A Member 21st.—The contribution to your issue of Feb. 19th, by "A Memore of Many Clubs," was written by a gentleman who evidently leans rather to the interests of Christianity than of cricket. This may

rather to the interests of Christianity than of cricket. This may be quite unintentional on his part, but it would nevertheless seem to be the fact. He desires to do away with strire of any kind. He would have the Staten Island Cricket Club act as a sort of protector to the kindred organizations in the vicinity of New York, and fight "to have its friends;" and be doubts whether the late amendment of that club's Constitution was passed with a view to a reform which prohibited its members from playing against it, even though they are older members of other organizations.

In the first place, the Staten Island Cricket Club was not organized for the purpose of exching its friends, its object in this respect being, and having always been, to take care of itself. It has found the task a difficult one enough, accompanied as it has heen with all the drawbecks which usually attend a new enterprise. The "Member of Many Clubb" rather takes it for granted that the Kindred organizations in the vicinity are an a state of beggany

Additional of Ministerior and the vicinity are in a state of beganizations in the vicinity are in a state of beganization and must need fall back upon outside resources to support existence. We must confess this state of affairs is novel to us. However the fact may be now, the records of matches for the last three seasons have shown such a condition of affairs that

the "kindred organizations" have come in for their share of the spoils and of victory equally with the Staten Island Club. The Staten Island Cricket Club has always been in the main op-posed to revolving; and whenever it was practicable to get along

with its own exclusive members, it has generally done so. with its own exclusive members, it has generally done so. The present flourishing condition of that club is due to the vigorous exertions its own members have made to secure attractive grounds, an increase of membership, and a capable professional. It has now a list of members which seems to gruarantee that in the future its elevens can be made up from its own members; if thinks that it is to the interest of cricket that some rule should exist probliditing a pooling of New York clubs, and it has passed the amendment referred to for this purpose. If a club by its own neglect and inactivity has allowed itself to run down to the level of stagnation, the course for it to adopt is the course which ever we club has before it, and that course is

the course which every me sugment of the course which every me club has before it, and that course is to set he towns it and evert a vigorous activity and interest. By such means success is certain to result. Let the custom once be recognized of gretting a club's bone and show from the raults of some other club, and it will invariably make up its clovens from such sources, and never rely upon its own recruits.

Cricket matches are the most exciting and enguging uses or ap-Criect materies are the most exerting and engaging uses or applications of cricket. Most men in practice study skill to the end that it may serve them and their club on match days. Every man attaches most value to that which is exclusively his own, and will make the greatest sacrifices to obtain it. This rule holds good in make the greatest sacrifices to obtain it. This rule holds good in all human affairs, and so it is with clubs. A victory secured without any fail from outside sources, is what a club enjoys beyond anything else. Such a practice infuses vigor in each member of the eleven, and they all work together as one mun to one purpose, and give their best individual and collective work. Destroy this sense of exclusive ownership and individuality by an interchange of members, and you destroy one of the chief incentives to the perfection and success of cricker. We are informed the Staten Island Chub had this end soiley in view by the passage of their amendment to their Constitution prohibiting revolving. CHICKET.

Monropay, Coloury Claus.-Mr. F. Standliffe, Scoretary of the MAC. C., writes that his club is not to be disbanded, and that the prespects for the coming season are better than they have been for a long time. We are heartily glad to hear this good news, and wish the old Montreal Club a successful year. It is their turn to visit New York, and we will give them a warm welcome when-ever they may come.

Dachting and Canocing.

NATIONAL YACHTING ASSOCIATION.

A VERY harmonious meeting was held March 1st in the parlors A of the St. Denis Hotel, at which the following clubs were represented:: San Francisco, Inflido, New Jersey, Jersey Uty, Satem, Me. Columbia, Empire, Hudson River, Yonkers, New Bed-ford, Cleveland, Williamsburg, East River Yacht Club, National Y. C., of Jersey City, Osikosia, Albumy, Portland, Me., and Chicago

-righteen in all. An organization was effected with Vice-Commodoro W. H. Dilworth, N.J. Y. C., as President; John Frick, Columbia Y. C., a Secretary and Treasurer pro tem; and George M. Mausileid, Salem Bay Y. C., and Charles G. Yale, San Francisco, Y. C., as Assistant Secretaries. After general discussion a constitution was adopted, and ordered to be sent to all the clubs participating for

It was also determined to elect an Executive Co rathention. It was also determined to elect an Executive Committee of thirteen by bathot of the clubs as a working body, to draw up a code of by-laws, sailing rules, etc., and the annual club dues were fixed at \$15. Clubs were requested to contribute \$3. each to coyer the necessary printing of the constitution for circulation among them, and other expenses. After ratification of the constitution further steps will be taken to perfect details at the next meeting, to be held in New York the sec-

and Wednesday in April.
The letter of indersement from the San Francisco Y. C. was The fetteror invasionation to sair remoses 1. C. was re-elved with considerable acclamation. The request of the Al-bany Y. C. for the adoption of a national burgee was favorably received, and will be referred to the Executive Committee for action; and the letter from the Cleveland Y. C. in relation to granting the full privileges of a yachy's license to creat under twenty tons, will be sent to all clubs for signatures and united

Clubs and still lain the Association on the same terms as those already participating until the constitution has been final adopted, when their admission will, of course, be subject to a ve of the Association.

YACHTING NEWS.

SEAWANHARA YACHT CLUB.—An important meeting of this club took place at Delmonico's March 1st, Commodore W. A. W. Stewart presiding. The following mombers were added to the club: Messes, W. Howard Mitchell, John A. Stewart, Jr., Edward Mills Messis, Moward Mellert, Moger M. Sherman and Sidney J. Mitchell, Charles E. Jenkins, Roger M. Sherman and Sidney Stratton. [The resignation of Mr. John R. Waller was ac-epted with regrets. The sum of \$2,150 was appropriated for the

club fixtures of the year as under:—
First Beent-Monday, May 31st (Decoration Day), opening cruise of the club, at 10.30 A.M., from Tompkinsville, Staten Island, round the Southwest Spir buoy to Gravesend Bay, where the triends of the club will be contentiated at dinner at some convenient hotel.

Second Event -The Corinthian race, Saturday, June 12th, for Second-class schooners, and litest, second, third and fourth-class shoops; the prizes to be \$100 to the winning schooner, \$00 to winning sloops of the first and second class, \$85 to the winner of the third, and \$05 to the winner of the fourth class, with indivi-

the third, and 55 to the winner of the fourth class, with matural outprizes of \$5 to each man in the winning yachts.

Third Event—The Corinthian crulse, to begin on such day in July as the Commodore may hereafter select. The usual Fourth of July race at Oyster Bay is to be omitted this year, and a race at the end of the cruise substituted.

To the open matches it was decided to "admit only yachts of the

New York, Atlantie, Eastern and New Bedford Yacht Clubs. It was also resolved that sailing masters, cooks and stewards should keep below decks during Corinthian races, and that pilots should not be carried. Tuo club has adopted a rubber button in place of the brass or gilt ones on the uniform, and a new cap after the pat the brass or gilt ones on the uniform, and a new cap after the pat-tern of the English naval service. On the Corinthian cruise only working topsails to be allowed, and no booming out poles except regular spinalacer booms. The mest important resolution was offered by Rear-Commodore Schuyler, creating a prize for sea-manship during the annual cruise, on a basis similar to that adopted by the San Francisco Y. C., and advocated in these

ROYAL NOVA SCOTTA V. S .- The squadron sailed eleven race ROYAL AOVA SCOTT V.S.—Inc squarous sance devoir races during 1870, with sixty-eight entries and fifty-eight starters and nineteen prizes. Of these twelve were presented by the Squad-ron, one by the Vice-Commodore, Rear Commodore and Hon, Secretary; three by the Hon. Secretary, one by Mayor Tobin, of Halifax, and two by the officers of the Hoyal Artillery and Royal Engineers stationed at Halifax. The Squadron now has thirty eight yachts on the list, and new ones will be added this season.

OSHKOSH YACHT CLUB, - Editor Forest and Stream :- At a meet or of the O. Y. C. to take some action in reference to a communication from the National Yachting Association, to be held in New York in March next, the following delegates were elected to rep Tork in March Rext, the following diagrams were checked to resent the O.Y.C., viz.: Commodore George W. Burnell, Frank Heilig and George M. Hasbrouck.

The election of George M. Hasbrouck Secretary, in place of F.

I. Clark, removed from the State, was conceded to be a good choice. All communications addressed to him will receive prompt

choice. All comminications addressed to thin will receive proup-attention.

We also organized what is to be known as the "Sportsman's As-sociation," to prohibit the wholesale staughter of lish and game in this section of the country. Officers: C. W. Relker, Presi-dent; A. W. Welsbrod, Secretary; H. B. Harshaw, Treasurer.

NAUTHER YACHT CLUB.—At Salem, Mass., a new yacht club has been formed called the "Nautflus Yacht Club," and the following officers have been elected for the ensuing year:—Commodore, J. W. Dodge; Vioe-commodore, J. Remon, Jr.; Fleet Cuptalin. Snow Rich; Measurer, A. J. Frisbec; Scoretary and Treasurer, Frederick Cate. The club has already a membership of forty, and has about tweenty-five boats entered, including some of the fastest yachts in the vicinity. There are six boats building for members of the club.

F. C.

CRUISE OF THE IBERIA .- Mr. Ashbury, formerly owner of Cam CRUESS OF THE HERIA.—Mr. Ashbury, formerly owner of Cambria and Livonia, has been doing some extensive cruising in the 81-ton yawl Heria, having visited the coast of Brazil in her. She arrived at Portsmouth, England, Feb. 24, thirty-three days from Burbaloes. The passage was very storny, but the yawl behaved exceedingly well, and was not once hove to, although she passed ships that were lying to under lower topsails.

NEW YACRTS .- Besides the large 55-ton sloop noticed in the read Actify—beauts that the large of the following the following chatbert, of Trenton, is longthening the following a following a following a for Capt. Murray and Mr. Duggan, and a steam yacht, fift, long, for S. Stevenson, of Brockville.

THE BRITISH YACHT FLEET.-The value of British yachts is es timated at \$20,000,000, including only those over five tons. Smaller craft are classed as sail-boats only. The fleet gives employmen to 5.00) sallors.

AN OLD STAGER. - There is hauled up at the foot of K street South Boston, the old schooner Bull Bow of Charlestown, built in 1816. This craft has the original planking put on when she was built. She is well preserved, and likely to last many years yet. Those who should know say sho is very fast and weatherly.—Boston Herald.

EXPERIMENTS WITH BALLAST .- When the Boston sloop Gael was EXPERIMENTS WITH BALLAST.—When the hoston stoop dust was hunched she had all inside ballast. Next season about 1,500 pounds of iron wore placed on her keel, and her performances were condered much improved. The third season lead was substituted for rsn, and she excelled her provious record, especially in heavy weather. No theory about this.

THE LAST OF A CRACK.—The famous Undine, sunk by collision with a steamer in Boston Harbor last summer, has been hauled

out, and will be knocked down to the highest bidder March Bili. The steamboat company paid all damages, and Mr. Bryant will probably buy.

ADDIE VOORUGS .- Lots of them are coming to it. ADDIE VOORHIES—Lots of them are coming to it. This well-known sloop is to have her spars cut down, and will receive a cruising suit from Crutes' loft in Boston. The Lillie, Messs, Dillingham & Band, follows in the same line. Once ridour sloops of their excessive smooth-water spars, and their speed is gone. Then we will take to a more molerate model, which can be driven first under a sensible rig. With a reasonable rig our present vessels are decidedly slow; it is only by oversparring that we make them go, and when this fact becomes known we expect to see improvements made in form with a view to reducing resistance, and not altogether in the direction of excessive stability, consequently cutting days to cruising some to cruising days to other ways, in what a cutting down to cruising dimensions-in other words, to vessel can carry—we'welcome as a' step that is sure to lead to a commendable modification in model.

IDLER AND CAMBBIA. - In taking a lay mouthly contemporary

IDLER AND CAMBRIA.—In taking a lay monthly contemporary to task for some harmless "spread-eagleism," the fondon Field has the following:—
"By the way, the Cambria in 1876 sailed a match against the Iller round Block Island buoy and back in a fine breeze—the only real breeze the Cambria had during any of her matches in America—and in a turn of twenty miles to windward Cambria beat Iller. rea—and in a turn of twenty mines to windward canting used. Ider-nincteen minutes. The filter carried way her bobstay, but at the time the Cambria was so far to windward that practically the re-sult was not affected by the accident. The Cambria beat the Idler four or five times altogether, and Idler beat Cambria (we in light tour or live times utogetier, and loter beat common twice in light wind. At any rate littler must at present be a different ship from what she was in 1870 if she can show "littler" on her stern to the English yachtsall round the course at the next squarkor regards. We should like to see what the Mirituda would do with the Idler in a twenty miles thresh to windward in a breeze that would make in a twenty miles thresh to windward in a breeze that would make the former house both her upper sticks. If we have a tearing westerly breeze, like that in the match round the Wight last season, we should expect to see Celonia, Egeria, Miranda and Seabelle bearing up round the Needles, while Idler would be still jumping at sea off St. Catherine's. Perhaps after all it is not the Idler of 1-50 that the English yachts will have to chose round the Cowes course in 18-9.

The Idler has been altered considerably since 1870; she has been lengthened and "deepened" and now has a flush deck. Her sea-going powers have been materially improved, but she is prob-ably no smarter than in 1870, when she ranked as one of our fastest. We certainly think there are several schooners in England which in a lumpy sea would give ldier a severe drubbing, though which in a lumpy sea would give life? a severe drubbing, though in turning to windward in moderate weather like, might turn the tables, especially if there is much lee-going (ide. The dimensions of life? are 108 ft, over all; 97 ft, water-line; 22.5 ft, beam, with 9 ft, 10 in, draft without center-board. Built by Sam'l Pook, of Fairhaven, Conn.. in 185, and altered by Henry Steers, of Greenpoint, in 1814. Sails by J. M. Sawyer. Draft with board down about 18 ft. Is one of the most sightly schooners w and is now owned by Mr. Fisher, of Chicago.

Run is now owned by Air, risin-to classically and received a very truly remarks; — In his report for 1879 the Supervising Inspector General of Steam Vessels took notice of the excessar bicons tee for steam yachts and other small vessels using steam power, and suggested that a charge of 55 would be enough for the annual

nspection or such craft.

"The objection to the present fee of \$25 is two-fold; it is out of proportion to the size and importance of the vessels paying the license, being as much as is charged for steamers of 100 tons butden, and it is practically prohibitory to a large class of men who

would otherwise build and use such vessels for pleasure or profit.
"It is gratifying to note that a bill has been introduced in Congress to carry out the Inspector General's recommendation. Its passage would be altogether benedicial."

With the exception of Herreshoff's experiments we have been With the exception of Herresnon's experiments we have been almost at a standstill in America, while England has developed the; Willan's three-cylinder, the Wigzell & Halsey rotary, the Perkins and other radical innovations and improvements, and notably the efficiency of high speed engines of the common loco-motive side-valve type, as in the Thorneyceaft launches.

SANDY HOOK LIGHT - Notice has been given by the Light-SANDY HOOK LIGHT.—Notice has been given by the English House Board that in consequence of the encroashment of the sea upon the site of the present light-house known as East Beacon Light, Sandy Hook, the light will be exhibited on and after March 15th from the iron tower recently creeted on the site occupied as the East Reacon in 1850 and which is situated 375 feet from the the East Bencon III 1500, and which is structure as feet from for present light-house structure, in a course bearing south by east from it. The new tower is of cast-from and is painted red. The lantern is painted black. The light will stand forty-two feet above the base of the tower and forty-six feet above mean sea-

STILL ANOTHER-Rear Com. Sumichrast, R. N. S. Y. S., will hoist his pennant aboard a fine new 20-ton cutter about tle of June. She is now building in Halifax. Iron ballast inside

YACHT CLUBS IN FRANCE.-The recent annual report of the Tacht Club de France shows on its books 118 yessels, with an aggregate tonnage of \$,433, or an average of 57 tons to each yacht. The amount of prize money offered by the club to racing associations under its auspices was \$3,400. This is certainly not u bad exhibit. There are now twenty-eight regular clubs in France, besides some forty regatta associations.

PROVISIONS RUN SHORT, - The two venturesome individuals PROVISIONS IGEN SIGET. The two ventures and monitorial from codish latitudes, Burrill and Coombs, who left Boston July 9th hast year in a whaleboat of about one and a quarter tons, brought up by steamer in New York. They left port in the little Golden State, intending to reach Australia in time for the Melbourne Exhibition. Everything went well until they must zerr St. Jago, Capo Verde Islands, which they had made in first-eight St. Jaco, Cape verte (stands, writer they had made in Inty-elgit days. Rough weather was met, but the tiny erait seems to have performed well enough, and the voyage might have been accomplished had it not been for earle-issness in stowing the provisions, which were all spoiled by the sea and had to be tossed overboard. They tried for St. Helena, but were driven to leevand, and when almost exhausted for want of food put their helm up and made to the season of the control of Parxil whome they remuting for a white n island off the coast of Brazil, where they recruited for a while mong the fishermen and then sailed for Bahia and returned to among the isactined and then senior to full health and see no this city by mail steamer. Both men are in full health and see no reason why a small boat, properly modeled and litted, cannot go o sen as well as a ship.

UNION REGATTAS IN BOSTON .- The necessity for a National Yachting Association is shown by the following call to Boston vacht clubs :-

yacht clubs:—

"Dorghester Yacht Club,
"Cour House, Harrison Square,
"Boron, Ethings, 1880.

"Dear She: A committee has been appointed by the Dorchester Yacht Club to confer with committees of the other neighboring clubs, who shall see fit, for the purpose of drawing up a unis-

form set of sailing regulations and system of measurement for

torm set of saling regulations and system of measurement in time allowance, under which union regatas are to be sailed. "We do not desire that the clubs commit themselves now to adoptany particular set of rules, but think the proposed Associa tion should result in a set of regulations which it will be for the full advantage of all to adhere to

Hoping to hear from you as soon as convenient, we remain yours truly,

" FRANK E. PEABODY, Chairman COOLIDGE BARNARD,

GEORGE S. RICE.

" HARRY S. MANN

"Committee of D. Y. C. "P. S.-Please send answer to B. Barnard, Harrison Sq

THE PANNIE.—Mr. Bryant, of Boston, has bought the large sloop Famile flaid up in Gowanus Basini, built at Mystic by Richmond in 1971. She is 72ft, deck, 66 w. l., 23ft, 9in, beam, 6ft, 9in, hold, 17ft draft with board, 5ft, without

THE MIDGE.-This little sloop has been hauled out at Pier yard in Greenpoint, and will be altered into a keel, Boston

THE CARIN LOCKER.—To remove old paint: Slack three pounds of stone quickline in water and one pound American peerl ash. as thick as paint; apply with an old brush and let it remain for as these as paint; apply with an old order and ret remain of welve or fourteen hours, when the paint will peal off easily. Black varibh: Two pounds gum shellae, two pounds umber, one gallon linseed oil and one-quarter pound of lamp black; boil together for four hours over a slow fire. Painting: A gallon of mixture, or say slx pints raw fluseed oil, one pint bolled oil, and one pint turre, or say six pints raw missea on to the pint control of day none pint turrent pounds of dry paint. On woodwork a gallon of paint will cover from 450 to 600 square feet, on iron about 700. Putty: Spanish whiting and linseed oil well beaten and kneaded into a stiff pasto. Lacquer for brasswork: Eight ounces of shellac and one gallon of spirits of

THE DIFFERENCE.-A little so-called nautical journal of the fly left variety has been making the rounds of our advertisers of late misropresenting this journal, and spinning correspondingly inflated mondetly in its own behalf. The facts in the case are these: The sheet in question has only recently emerged from disthese: The sheet in question has only recently emerged from alshomorable bankenpity; has noise outstanding; is shicking its limbilities under the lee of petticouts; never had a paying circulation, in its most prosperous days, of one thousand, and now has probably much less even than that; its columns are replete with "decoys" and "deadbeads;" if has no influence, and is of odorous reputation. The general circulation of FOREST AND STREAM ous reputation. The general extraction of rolls and stable at thirty times as great, and among yachtsmen we have a hundred times as many readers, for the puny longshore sheet cannot muster fifty of that class on its books. In spite of this, it advertises itself as having the "largest circulation." Business obfained by such misrepresentation is equivalent to obtaining named of such instepresentation is equivalent to obtaining money under false pretenses, and parties who have been swindled by it can recover in the courts. If, with these facts before them, our patrons choose to throw money into the guitter by giving the petty sheet alluded to their support, it is none of our concern, but we propose to see that they do so with their eyes open. on the propose to see that may use with those of the fraudulent pre-comparison of our columns with those of the fraudulent pre-tender will save our advertisers from falling into his clutches The longshore sheet must seek its victims in other channels; its character is too well known in this latitude, and its unscruptulous mendacity will be exposed in these columns for the benefit of the public. Further particulars can be had on application. of the public.

MEASUREMENT.-An Eastern yachtsman writes as follows con MEASUREMENT.—An Eastern Juditishan writes as inlows con-cerning our recent article on measurement.—"Allow me to con-gratulate you upon your last article on measurement. It goes right to the point. It is timely and will serve to clear away much of the ignorance which has prevented a proper understanding of the subject heretofore. It establishes a foundation and gives us The subject herefore. It consists a formation and give an authority upon which we can proceed in our future consideration of the subject." Owing to press on our columns further material on this head has been postponed.

MEASUREMENT IN FRANCE.—It is to the credit of our French cousins that they are restive under the infliction of the old Thames rule and that they refuse to accept it in good grace any The Yacht Club de France has taken the bull by the longer. The reals tells of values as taken to other by the borns, and others are proposing a congress to settle the vexed question. We commend to their consideration the five axioms drawn up in an article in our last issue.

THE BEST MEDIUM,-There is no advertising medium equal to THE BEST AND STREAM for bringing to public notice yachts for sale or wanted to purchase. Its circulation among the rachting public is larger than that of any journal, whether daily, weekly or monthly. It covers the whole country. Not long ago a schooner monthly. It covers the whole country. Not only ago assence advertised a single time in these columns brought a purchaser in side of a week, and a recent card of the same nature has resulted in numerous answers to its first insertion. Parties intending to offer yacht property cannot do better than avail themselves of

WHAT THE PUBLIC THINKS .- A letter from the East says "We heartily indorse your views as expressed in your journal, which the yachtsmen of our club here thoroughly appreciate."

YACHT FOR SALE .- A fine little 5-ton cruiser, ready to go into commission, is offered at a great bargain. See our "for sale columns.

EXPERIENCE WILL TELL

MUSKEGON, Mich , Feb. 21st.

Editor Forest and Stream: Editor Forcet and Stream:—
The statement made by Mr. Thomas Clapham in your issue of
the 19th inst., that if would require "from four to six men to
handle a forty-foot cutter, if any speed was expected from her," is so much at variance with my own experience that I cannot let it pass unchallenged. Either his cutter is not rigged like mine or his men must be very slow. I have a cuttor-rigged yacht 38x85-22x5 feet, and with the assistance of one good man I can MAN SALE he in ordinary weather, and with two men hesides my-self I can the result of and stayball-her skipper expecting a severe squall, which, howpassed shead of the yacht-reefs shaken out, and all the ever, passed anem of the yaone-reces smaner out, and an the first-mentioned cloth spread, while the yacht continued on her course, and the entire time occupied for both operations was not quite ten minutes, and the work was done by two boys, both under eighteen years of age. These same boys with two others under eighteen years of age. These same boys with two others went on a four weeks' cruise last season, visiting Mackinaw and went on a four weeks' cruise has season, visuing Mackinaw and the various islandast the floot of Lake Michigan, crossed to Green Bay, thence up the shore to Kenesha, and from there home. Part of the time they were in company with a crack sloop from the west shore, and had plonty of opportunities of comparing the

workings of the two rigs in all kinds of weather. It is needless to add that they are decidedly in favor of the curter. I have during the past six years owned cats, sloops and one cuttor, and my experience is that a cuttor can be handled safer. easier and drier in heavy weather than our any other small yacht

"CORINTHIAN "AND HIS CRITICS.

Editor Forest and Stream :-

All these that my last communication, instead of being simply, is intended, an answer to the criticisms of your correspondents 'Rouge Croix" and "Martin Gale," in reference to practical experience in yacht or naval design, and correcting some mistake perions on magnifications are all correcting some instances made by them in their communications, especially regarding the seamanship of the former, which remarks unfortunately were omitted by you from my communication, has raised a horner's nest about my cars, or rather is deemed worthy of an editorial and a formal answer from the devoted (but not Dovoted) yachtsman, Mr. Robert Center, who, in doing so, socks "to kill two birds with one stone." While acknowledging myself a Corinthian, who-perhaps, is more ready with the pen than with the tiller, I have still some smattering of the subject treated of, principally obtained from a study of well-known authors, and observation of the performance of our own yachts for a series of years.

the performance of our own yachis for a series of years.

Mr. Center instances the well-known America, designed by Mr.

Steers, and speaks of the complinent paid her designer by Mar
rett in his book. He truly says, "that her centers were adjusted
with considerable skill and judgament." This simple acknowledgment to a practical man was not only forced from Marrett, buil from all England by her performances; and they further paid him a greater compliment, by immediately lengthening forward all the yachts in England.

Regarding his challenge to sail Volante against Mr. Clapham's sharpie, my mention of it at all was simply to correct a mistake sharple, my mention of it at all was simply to correct a mistace in reference to said challenge by your correspondont, "Houge Croix." I take Mr. Clapham's acceptance in good faith; and no doubt Mr. Center could be accommodated and fairly met, even it he objects to going single-handed around Long Island in the Volante. As to injury to the business of Mr. Ctapham by the said

roce, have no doubt that it would greatly benefit it.

I am pleased that Mr. Center gives "Boh" Fish credit for good things. I remain with the impression that he did produce two nuts, the Whiteap and the old Vision, which were not to be

nuts, the Whitecap and the old Vision, which were not to be erenched by the Dream or the Vindex. Regarding the Lofs, does he remember the club race, when the Vindex, that famed heavy weather yacht, was in distress, even in the Narrows, water kneedeep on dock, masthead and topmast gone, while every other vessel in the deer was earrying topsails?

As to vindicating the speed of Vindex, in comparison with Kripy's Arrow, I sak him to read the record of Vindex; it will do him good. He instances the Vindex winning two races; also the Vindex by hands down," Now, it must confess, I do not understand the term "hands down," as applied to yachting; and, while acknowledging my ignorance in that particular, can only imagine acknowledging my ignorance in that particular, can only imagine it applies to some Corinthian Regatta, or in a crowd of would-be-experts who are being initiated into the mysteries of yachtlug, or to regattas without an antagonist worthy of the name, somewhat

after Mischief's late victory.

As to your editorial comments, friend Editor, upon the value of naval design, you seem to intimate that I hold science in disalan, whereas I have the profoundest respect for science. Science utilizes electricity, but all theories as to electricity are but assumed; and so I hope I may regard somewhat in the same manner naval design, its theories, especially regarding speed, being

to such triumphs of science, you instance a Popofika or a Devastation monitor. Without entering the profound mysteries let us take some English authority on the subject, since they ap near fashionable among Corinthians. I instance the capsizing of the iron-clad frigate Cantain, and later the frigate Eurumedon, by the iron-chain rights (aphain, and later the trights Europhaeon, or which disasters so many lives were lost. In the exhaustive in-vestigations by the Amirally which followed the first-disaster, the verdict was that scientific principles were strictly followed in her vertice was find seeing proper and necessary precutions were ob-served, and all proper and necessary precutions were ob-served, on the necessary production of the produc-dence, or ather nn "unaccountable." So, perhaps, with the un-fortunate Mohack, so often quoted by you. Her Captain, such haps, was a Corintal in in matters which required expertness and indement

Now, as to the quotation from the great masters, in whom un-Rown genius often succeeds where science and education full Have you ever observed one of our vessels-of-war? Do not look at them casually as they lie in the Navy Yard, but ask from the officers and tars who man them of their performance at sea. will tell you that they often roll their yard-arms in solid, so that will tell you that they often rough the sea can be seen from the lower hold through the main-hatch. These, however, are triumples of skill, upon whose design untold wealth of science (principally German) has been esthusted. In opposition to this look at the frigate Niagura, designed by our ctical man of genius, Steers. Built under the greatest opposition of wound-be-selectives, and, among a recknowled to English to be the finest and speediest vessel-of-war ever structed, finally tinkered and destroyed by those who in do acknowledged their incompetence.

And now as to our own yaunted scientific yachts. I will not

And now as to our own vaunted scientific yachts. I will not give you the vain task of pointing to one instance, where a so-called scientific vessel has been produced and developed speed without some or other modification of rig or otherwhe. In a contemporary I was amused in reading the record of one of our sectentifically-rigged yachts. After specifying her afterations, such as in one instance of cutting a few feet from her bowspirt; in another, adding nine inches of skag aft, then removing it on another occasion; he continues and informs the reader that, her speed being remarkably free, she needs but a few additional cloths to be waging all to be one of the fastest yessels to windward—she her mainsail to be one of the fastest vessels to windward-she being at present, as is well-known, notably deficient in that re-

In reading the article upon yacht measurement by Mr. A. Cary In reading the article upon yacht measurement by Mr. A. Cary Smith, would respectfully beg leave to call his attention to some things which have probably escaped his notice, as seen through other glasses. In his objection to length as a measurement he saizes upon the old cry of our English friends, "Seaworthiness," and its tendency to produce wide, heavily-sparred vessels, and gives us a fearful picture of the behavior of over-sparred vessels; for the gentleman who sparred Vinder, Madacap, Intrepla, Vidol Christophick, Middle, Manache and Lossy the least ee and the new Mischief, remarkably cool, to say the least

Is length not the principal element of speed? In considering Is length not the principal element of spear? In considering embical contents as a measurement, be compared the schooner Intropid with Tidal Wairs. Would it not be better and fairer to compare Intropid with Hambler, one of her class? He certainly cannot object to Rambler for want of freeboard or depth or speed

either, in the comparison.

As to his objection to freeboard being taxed, witness the performances of Palmer, the bulklestas well as the fastest of our

large centor-board schooners. The records prove that a fast ves sel cannot be handleapped under this measurement by a 30w one. In continuation, he instances the Replan and Viren, and initiantes that Replan would, with more freeboard, have better "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the present Vision has "all round qualities." Albs! the vision has "all round qualities." Albs! the vision has "all round quali

round quanties. Ams; the present Psent mas "an round quartities." For myself I will none of them.

The next system of mea surement he considers is our measurement of Corinthians, the Seawanhaka, and probably the coming measurement of the New York Club. To exemplify the working measurement be instances a race of Schemer and Velante, in which Schemer defeated the Volante. In other words the little Schemer defeated the Volante, In other words the little Schemer, enrying four tons of ballast, defeated a powerful vessel carrying ton tous of leads, after being heavily handicapped by time in her own weather.

It simply proves that the Volante must be remarkably slow, and

"Corlnthians" to handicap a speedy that it is difficult even for

that it is difficult even for "Corinhiams" to handicap a speedy vessel, even when particularly interested in so doing.

Regarding Viron and Coming, he proves that the well-known speedy Coming can be defeated by a handleap of time to a slow one by this proposed measurement. In fact, to myself, not particularly interested in measurement, his labored argument simply results in attempting to reduce by time speedy vessels to alved with slow ones, the same problem which our English friends have been at for many years, upon whose measurement a vessel can be produced which has but one measurement, consequently ild be allowed so much time in a race that there could be but

ne result. Perhups, finally, it may be an advantage, since having tried the known, and failed to produce other than "all round qualities," in the unknown future, we may be more successful in producing something which may challenge the admiration of the yachting world by defeating our new speedy vessels by bandicap of mea

flag-ships of the Seawanhaka Yacht Club. If the Commodore ining-snips of the seawamnian agent thus, if the Commonore in-tends to command during the cruise of that squadron, I advise him always to start the day before. Upon this subject I will only mention a remark by a celebrated English yacht designer upon viewing one of our cutters. His advise was to "lock the designer perhaps he may design another." CORINTRIAN Feb. 12th

Woman's Column.

THE PENNSYLVANIA PLAN.

PENNSYLVANIA, February, 1880.

Editor Forest and Stream:—
I peruse the Forest and Stream:—
I peruse the Forest and Stream each week with interest, and think the editor deserves all the praise we can give him, in publishing a man's paper of so much interest to women and children. Our boys love the hear and fish stories very much; and of course they are going to take Forest and Stream when they get to be men.

My experience as a sportsman's wife would be very pleasant if it were not for the dogs, but alas! those heuritul pointers and setters have no clearms for me. If the setters would only set still and the pointers keep their heads pointed toward the barn, instead of pointing it in the back door whenever it is left open, I could endure it; (in fact I have to say, may). In the full one very busy day I was helping prepare dinner, and as it was baking day there happened, to be only one loaf of bread—"the last loaf." I laid it out on the shelf, when the next thing that attracted my attention was cur. "Flora." She had pointed the loaf and was retrieving with it as fast as possible, and only half an hour to dinner. Inagine, if you can, how shiling I must have looked, and with what good

pointed the leaf and was retrieving with it is fast as possible, and only half an hour to dinner. Imagine, if you can, how shifting I must have looked, and with what good grace I prepared more; and as I told my busband of my grievance he only stroked the head of 'the beautiful animal and said: "Mistress ought to have been more careful and not to lave left the door open, hadn't she?"
Unlike the most of you gris, I am gun-shy, though I rode several niles the other day with the gun in our enter. I really hope to be brave enough to try my hand at shooting some day, but should prefer glass balls to birds. I really enjoy seeing my husband shoot glass balls, I think he is a capital shot, and have often tried to get him to challenge Bogardus, which I presume he will do some day. I have never accompanied my husband on his lunting trips, but expect to do so next fall if nothing

him to challenge Bogardus, which I presume he will do some day. I have never accompanied my husband on his hunting trips, but expect to do so next fall if nothing happens. My husband is a physiciam.

I ride with him a great deal and enjoy the wild and picture-quo seenery of old Pennsylvania very much; in fact, our lives are gliding on very picessarily, and if wives only seek happiness they will find it, if their husbands are sportsmen; and I try to put up with all their eccentricities; but deliver me from such a trial as Zena had, keeping a dog under the bed nights.

SOUND ON THE DUCK QUESTION.—The Northeast (Md.) Record complains, in a recent issue, that Maryland duck shooting is being ruined by the incursion of "an army of sports from all the ends of the earth who come down here shooting is being ruined by the incursion of "in army of sports from all the ends of the earth who come down here and bang away like mad, spoiling the sport as well as the profil that rigitly belongs to the citizens of the State." and the writer calls for a law which shall limit ducking licenses to citizens of the State. It is sufe to assume that this is not the Chesapeake and Susquehama professional duck hunters themselves, for no one knows hotter than they do that the greatest income from the ducking grounds is derived from these so-termed "sports" from all the ends of the earth, for, as the Havre Republican pertinently observes, the sportsman from abroad cannot go down there" and bang away like mad, "unless they charter one of the regularly licensed craft of those waters, or own their own craft, which are governed by the same laws that regulate those of citizens. This editor adds: "Mr. Jos. Bailey (of the well-known firm of jewelers, Phila.), whom we mention by way of illustration, asserte that every pair of ducks he kills on our flats costs him at least \$10, and if he thought that he was doing the slightest possible injury to a single person in Havre de Grace he would never shoot another duck in our waters. This, we believe, is the sentiment that governs nearly all who visit our waters for the purpose of shooting ducks, occasionally. In our judgment the gamers of Havre de Grace should be united in some course of action. We have laws and legislation enough on the subject—in fact, have too much. The laws as now on the satute books were passed in precisely the shape our gunners defact, have too much. The laws as now on the saquesteeth fact, have too much. The laws as now on the saquesteeth books were passed in precisely the shape our gunners destred them, and if its provisions were faithfully carried out them would, no doubt, be more ducks killed and less grumbling."

Forest and Stream and Rod and Gun.

A SWE do not employ any authorized agents or canvassers, we offer our friends in every locality who will give any time or attention to collecting and forwarding subscriptions, the following inducements to obtain subscribers for the "FOREST AND STREAM" at the rates and commissions given below:

CLAY BIRDS! CLAY BIRDS!! CLAY BIRDS!!!

Beck's Patent Clay Birds and Trap.

Pronounced by all Who Have Scen it as the Best Substitute ever Invented for a Living Bird.

Fires like a live bird; is as hard to hit as a live bird; affords as good practice as live birds, and at a nominal cost. The bird is made of clay, burned hard, and breaks when hit with shot.

Our Tran will throw the Clay Bird further than any trap will throw a ball; keeps it in the air longer, and gives the shooter plenty of that to cover. In using these birds you secure

Better Practice than Glass Balls Give,

And avoid the many objectionable features of balls. Give them a trial, for you are sure to be pleased, and you can't yest a small sum of money to better advantage. Price of Birds, \$2.00 per 100. Traps, \$6.00 each.

Unfrequented Regions of the Adirondacks.

WILL endeavor to describe a few localities in the northern portion of the Adirondacks, most of which have been comparatively little frequented by sportsmen from abroad. There are but two roads in the country, running north and south, reaching up into the heart of the Adirondack region. One is from Malone, running directly south to Paul Smith's on St. Regis Lake, and past Meacham Lake; the other from Moira and Brushton, fourteen miles west, running directly south and parallel to the other to Blue Mountain. After going ten miles south there is no road crossing from one to the other, and all the country between the two is an unbroken wilderness. All the parties going in at the northern end of the Adirondacks, or nearly all, have gone in by the Malone road, and of course that portion in the western part of the county has not been nearly as much hunted as the eastern, except in the extreme south end, which has been bunted and fished over by parties fitted out from St. Regis and Saranac Lakes, and by parties coming in by Tupper's Lake. The road that runs south from Moira ends at Blue Mountain, twenty-four miles south of here. It is nearly opposite Meacham Lake on the Malone Road, about lifteen miles west of there and about twenty-five miles northwest from St. Regis Lake, or Paul Smith's There is a house there kept by Henry Phelps, with all kinds of accommodation for sportsmen, and charges reasonable—\$1 per day for board, and \$1.50 for guides. He will rig out parties with camping rigs, boats, etc., who wish to go to some of the streams and ponds in the vicinity. The house is large and commodious; he sets a good table, has good beds, and is much better liked than the former proprietor, Merrill, who died a year or so ago. The foot of the Sixteen-mile Level of the St. Regis River is near the house. Boats can run up sixteen miles on this, and it is a splendid place for deer and trout, with a bear occasionally. The localities, which are mostly new, and have been but very little visited, will all have to be reached by way of the Blue Mountain Wolf Pond, eight miles southwest from Blue route. Mountain House, is but very little visited. The upper branches of the Parishville River run close to it and abound in trout, some of a large size, and in any decen-

kind of a day one can catch all the trout he can carry. Deer, bears and panthers are to be found there. I was there in June last, and at night the deer would come around the shanty and whistle at all hours; and we frequently heard a catamount scream, and one of the party saw two on the banks of the pond. There is no road in there, only a blazed trail. When I and my party went in, we had Mr. Phelps take our boat and baggage on a juniper—a sort of sled—and part went ahead and cleared the road; the rest stayed by the sled and helped it over logs, and in that way we got along very well. The river there is fifteen to twenty-five yards wide, and there are levels of still water and rapids. The levels have to be fished from a boat.

There is another branch a short distance below, which is smaller, but it is full of trout, and has never been fished by a dozen different persons. I did not go to it, for we got more trout than we wanted where we were close to our camp. There is a very good shanty at the boad, made of logs, with a bark root, with a door and small glass window, belonging to a trapper who raps here in the late fall. All the country west of Blue Mountain is an unbroken wilderness for miles, until you come to the back settlements in St. Lawrence County, and there are several ponds and streams which have no name and are only frequented by trappers and a few still-hunters. Gavanaugh Pond is only three miles from Blue Mountain House and is a great resort for deer and other animals, but it is not much of a place for trout. Many deer were killed there last season by only a few persons hunting. Mr. Phelps keeps a boat there, and has a rough shanty buil on its shore. All this country west of the road for eight or ten miles morth of Blue Mountain House has never been wisted but by very few, if any, sportsmen. It is out of the way of parties coming from the large sporting houses in the eastern section of the Adirondacks, and the only way they can reach it is to come down the St. Regis River, through Sixteen-mile Level,

one now at Wolf Pond if no one has found it and made away with it.
Four miles below the Blue Mountain House, on the river, is Spring Cove House, at the head of another level; it is owned by Den Snith. He keeps sportsmen and acts as guide himself, and is a good one. He will furnish boats and provisions and everything for camping out, and will go anywhere with parties at a reasonable price. He was up on the Sixteen-mile Level four weeks last season, with two young gentlemen from New York City. He is a good cook and understands all about hunting and fishing. His address is the same as that of Mr. Pheles.

son, with two young gentlemen from New York City. He is a good cook and understands all about hunting and fishing. His address is the same as that of Mr. Phelps, St. Regis Falls Post Office, Franklin County, N. Y. Parties going to either had better write a week or so in advance, and it to Mr. Snith be will meet them at St. Regis Falls. His place is some distance off the main road. About five miles lower down the river is the Humphrey Level, eight to nine miles in length. Several families live near there and will take a limited number of boarders. Three or four families live in that vicinity, among whom is old Bill Edwards, who has killed more large game than any one man in the northern part of the Adirondacks. He has killed seven catamounts or panthers, and bears and wolves by dozens. He acts as guide and will go with parties to any locality, but cannot furnish anything but boat and dogs. Mr. Dinnnick, a resident there, will always accommodate a few boarders at seventy-five cents per day and throw in the use of his boat. It would be a good place for two or three to spend a week or more, who could handle a boat themselves and fish and enjoy the mountain air at a small expense. It is about fifteen miles from here (Moira), and if they wished to go off to any other place they could get Edwards for guide, or some of the others there. There are

several small ponds near there in which front are quite numerous; besides, good trout-fishing can be had in the river. The East Branch of the St. Regis empties into the Middle Branch near the foot of this level, and along both streams here is a great place for deer. It was on the East Branch, near here, that a party of three killed four-teen deer and a bear in one week November last. Up the East Branch, through its whole length to where it rises in Meacham Lake, is an unbroken wilderness, except one or two small clearings of an acro or two; one at the only place where it runs near a traveled road. That is at the old Sanford & Skinner Saw Mill, at the foot of a level of eight or ten miles. A Mr. Sampson keeps a house here and boats, and lass several grown up boys who act as guides; it is a good locality for deer-hunting and troutfishing also, and is the greatest place for rufled grouse I know of; in fact they are plenty all over the North Woods clear down to this village.

I have given you a sketch of some of the localities that I know of, where good sport at either hunting or fishing can be had, places I have visited myself. But there is a large portion of the country between the two main roads, which I never visited, and I know of no one who ever did.

The Blue Mountain House is situated in a fine locality, and the view foot is it the heat of course and the country. several small ponds near there in which trout are quite

main roads, which I never visited, and I know of no one who ever did.

The Blue Mountain House is situated in a fine locality, and the view from it is the best of any sporting establishment I ever visited in the mountains. One can look from its door over a tract of country sixty miles in extent. White Face Mountain, in Essex County, is in plain sight, also bebar Mountain beyond Meacham, and the whole chain of mountains in the northeest and St. Regis in the southeast. It is the best place I know of for the sportsman to go to that is easy of necess, and to fit out from to go to other localities not much frequented, to camp out, and the cest will not be one half what it would be at St. Regis Lake and other places east and southeast. Or course they have not all the extrast to be found at Paul Smith's or Martin's and other older establishments, but plenty of good food and good beds, with board by the week for \$4.

I go independent of all. I have a tent, boat, sheet-iron eek for \$4.
I go independent of all. I have a tent, boat, sheet-iron

Smith's or Martin's and other older establishments, but plenty of good lood and good beds, with board by the week for \$\frac{8}{2}\$.

I go independent of all. I have a tent, boat, sheet-iron stove, etc. I camped seven weeks on the Sixteen-mile Level all alone in August and September hast. Took adong a seak of flour and all other things and did my own cooking shid balong. The whole trip did not cost mo over \$15\$ from home. I killed a great many spruce partridges in September. They are living the betties them and have not at taste. I caught a great many spruce partridges in September. They are living in loles along the level, and gave a great many away to blue berry parties who come in there in Angust to gather the berries. The first week I was there I heard a catamount scream regularly overy morning about 30 clock on Buck Mountain, opposite my camp, and shortly after an old hunter gathering spruce gum over there saw him or his mate. There are one or two places on the Malone Road to St. Regis Lake, where much better hunting and fishing can be had than in the vicinity of the sporting establishments or hotels. McCollom's, about half way between Meacham and St. Regis Lake, is yet a grand good place to go for deer or trout. I went there every season for eight or nime years previous to the last two. Osgood fliver and Hay's Brook, close by, are good trout streams, and I have caught a trout in each that weighed three pounds, one three pounds two ounces by McCollom's steely ards, and the other measured twenty inches in length. I nover fished in flay's Brook but what I got my basket full of trout. It is the best stream for trout in the hot days in July and August I know of, as the water is cold on account of the many spring of, as the water is cold on account of the many springs along its banks, and trout run up it from Osgood River and Mcacham Lake. (The Osgood River enters into Mcacham Lake). There are some large trout in it, but the average run from eight inches to twelve inches in length, with some up to eight en lene

Titusville, are all good splaces for game and trout, but being near Malone they are overrun and fished and hunted to death soon after the sensons open, the same as it is in vicinity of St. Regis and other lakes and ponds in that neighborhood. . . The old Northwest Bay Road, running across the Lower St. Regis district from east to west, or northwest and southeast, is not now in use, only as a foot-path, except at the western end. It was built by the array of the war of 1812, when they went from Crown Point to Lake Ontario, and has grown up with bushes and filled in with fallen trees so as not to be passable with a wagon.

ALBERT CORNISH.

DULLING FOR TROUT.

URING the summer of 1857 the Rockbridge Alum Springs, in Virginia, were crowded with distinguished visitors from all parts of the South, who came there principally to drink of the health-giving waters. The town of Lexington, seventeen miles distant, always sent its quoto on special occasions, such as ball nights, concerts and excarsion days, to Jordan Springs, ten miles south. Among the many who represented the college town at the springs, and who were sure to be there the latter part of every week, were John Letcher, a member of Congress at that time, and T. J. Jackson, a professor in the Virginia Military Institute. These two gentlemen were constant and steadfast friends then and in the squally days that came after, and their clief amusement while at the "Rock Alum" was derived from the pleasure of rolling ten-pins—a game both gentlemen

amusement while at the "Rock Alum" was derived from the pleasure of rolling ten-pins—a game both gentlemen were very fond of. The alleys were situated on the edge of a creek bearing the name of the springs, and at the bottom of the towering Mill Mountain; and herein honest John Letcher and the modest Professor enjoyed themselves in an innocent way.

The principal hotel in Lexington was kept by a wag named Mann, a jolly good fellow, a prime favorite with the students and most of the townspeople, and always ready to bet on any point there was the slighest dispute about. This latter talent of his was the magnet that drew the young students to Mann's Hotel; and one evening, while a party wassitting in the capacious office, the subject of trout fishing was brocched, and as it was well known that Rockbridge a work of the subject of trout fishing was brocched, and as it was well known that Rockbridge a work of the subject of trout fishing the variety of the subject of trout fishing was brocched, and as it was well known that Rockbridge a work of the subject of the subject of trout fishing the variety of the subject of trout and the subject of the sub

sation in the alley, and got his promise not to mention his mode of catching trout even if he was engaged by Mr. Maun. While Hostetter and Mark Lowis were biting the end of the last strawberry in their julep, Bill Mann entered, and after an introduction and a few words of explanation in regard to the locality where trout were abundant, an agreement was entered into whereby Bill Mann was to give Hostetter \$10 if eighty trout were caught in one hour. Ten dollars to the hunter was a mountain of wealth, and the next morning he was on hand bright and early. Bill Mann showed hinself with a fancy rod, silver reel and a box containing any number of different colored flies in his lands; and at this novel appearance Mark and the hunter naturally smiled; but the secret of their smile hey kept to themselves, and as they jogged along up the banks of the creek the witry hunter kept the other two in a state of excitement by his wonderful yarns about trout fishing and hunting the "varmints" that the mountains above were full of. After a walk of two miles they came to a spot where the creek widened into a large pond, or small lake, the water of which was as clear as crystal, and the nimble ish were sporting about as thick as locates, hiding themselves under the rocks at the near approach of the human step. All around was solitude, the very sky being shut out from view by the thickness of the foliage.

"Here we are, gentlemen," said Hostetter, and imme-Here we are, gentlemen," said Hostetter, and imme

"Here we are, gentlemen," said Hostetter, and innucately thereon Mr. Mann commenced to rig the end of his line with a purple fly; but Hostetter ended that amusement by saying: "Put that foolish new-faugled notion away. You came here to get eighty trout in one hour: now I'll save you all that trouble by catching them my-self, and to save any dispute, when I enter that water, time me."

time me."

Thereupon Mr. Hostetter divested himself of his boots, and, after rolling his pants up as high as possible, took a piece of common twine out of his pocket, and making a running noose on one end entered the silvery pond, saying, "Pull out that watch."

piece of common twine out on its pocact, and making a running noose on one end entered the silvery pond, saying, "Pall out that watch."

Mark Lewis was not surprised, because he had seen the same operation performed before; but Bill Mann looked on this queer proceeding with eyes and mouth open, wondering what the next act would be. He had not long to wait, for the moment flostetter entered the water, he ran his left hand in under the rocks, which frightened the fish, making them swim out, and as sure as fate one would get his head in that noose which the hunter held in his right hand, which no sooner done, than "Old floss"—as he was affectionately called—would jerk him up and throw him out on the grass, when Mark Lewis attended to the comfort of the victim by placing him in a basket lined with sedge. This operation was continued with a lightning rapidity, and at last Hostetter, with face covered with persiration, looked up as if resting himself, and said: "Have you kept tally, Mr. Lewis?"

"I have," answered Mark, "and there are eighty-three in the basket, now," "How is the time?" asked "Hoss," and the answer came back from Bill Mann, "Five seconds to spare."

Getting out of the water Hostetter dried his limbs in the wild grass that was around there in abundance, and, and researches in the nearly turned their faces toward the inder-

Getting out of the water Hostetter dried his limbs in the wild grass that was around there in abundance, and, redressing, the party turned their faces toward the hotel. "Old Hoss" carried the basket, and between intervals Bill Mann ventured to ask the term or name of that kind of fishing.
"Dulling, sir; and it is the only safe way of fishing in this creek, for flies they won't touch, and the shade of a rod frightens them." Transpired Mr. Mans (tablet)

rod frightens them."
"Well, I must say," remarked Mr. Mann, "that this style of fishing is expeditious, but a more barbarous proceeding I know not of, for it does not give the trout a fair change.

Never mind about that," replied "Hoss," "fishing is

"Never mind about that," replied "Hoss," "fishing is no pastine to me; time is, however; and whenever you make another bet of this kind, be sure and go a-dulling."

After a pleasant walk the two miles were covered and the Springs were again reached, when, turning the corner, who should be seen standing on the porch of the hotel but Professor Jackson and Honest John Letcher. Bill Mann, in his blunt way, sang out: "Come, Professor, and see the snakes."

A second invitation was not necessary, and, when Professor Jackson looked on the innocent darlings in the basket, he exclaimed: "Biess my soul! these are not the kind of fish I saw while standing on the bridge. They are beautiful!"

beautiful !

are beautiful!"

Bill Mann's wagon was brought before the door, the basket of fish placed under the seat, and, before driving away, he placed the promised note in Hostetter's hand, and the latter in company of Mark Lewis made a call upon the pet snakes in the glass cage, who were found doing so well that another call was made on Charley Hunt, who enjoyed the story how Bill Mann caught the

doing so wer than according to the story how Bill Mann caught the trout.

That night, in Mann's Hotel, Lexington, a party of students sat down to a supper won by Bill, and enjoyed themselves amazingly in listening to his great exploit; but if there are any of said students alive to-day, they know for the first time how those fish were caught.

It is hardly necessary to say that the modest Professor was afterward the celebrated Stonewall Jackson; Honest John Letcher, the first war Governor of Old Virginia; and Bill Mann, Captain of the fannous Rockbridge Artiflery, Mark Lewis and Hostetter served an apprenticeship, the former as sout and blockade runner, and the latter as sharpshooter under the modest Professor; and as for Charley Hunt, the mixer of delicious juleps, he became the mixer of other delicacies while first officer of the Fayette Artillery.

Fishing is as good as ever in Rock Alum Creek, but I hope that the barbarous practice called "dulling" has gone out of fashion.

Sperick

The gun and fishing-tackle stores report good business, and this is a good indication that sportsmen are preparing for the opening of the season. The trout fishing in New York State opens April 1st, and we are advised that the event will be duly celebrated by the usual Fulton Market display of trout. From general reports, it may be predicted that the summer and fall before us will be unusually favorable for sport with rod and line and gun and rifle. The columns of the Fonest and Stream this week contain much information as to resorts and routes for sporting excursions. These reports will be found more reliable than the ordinary guide books,

Matural Distorn.

BOOKS OF REFERENCE.

VERY gratifying evidence of the increasing interest A VERY gratifying evidence of the increasing and in natural history, so-called, in this country, is the frequency with which we receive inquiries from readers for books of reference to aid them in their studies. Some of these questions come to us in very puzzling shape, and indicate clearly enough that their propo "ders have very crude ideas as to the scope of the term atural history It is manifestly impossible to name any angle work that will enable the reader to gain an adequate conception of the whole scope of biology. The most that we can do is to give a short list of works which they may profitably use in commencing their studies, and, as they advance in them, to recommend the student to specialists in various departments who may be willing to advise them further. It is an unfortunate fact that very many scientific works are so costly as to be beyond the reach of the average reader, but this cannot be said of most works recently published in this country. Most of the works enumerated below can be obtained from any book-seller, or if not known to the ones applied to, they can at all events be obtained by the intending purchaser by writing to the publisher. Government publications can often be obtained through the Congressman of the district in which the person desiring the book resides.

We have divided the list to make it more easy of refer-

cuce.

MAMMALS.—Prof. S. F. Buird, "Mammals of North
America." "Pacific R. R. Explorations and Surveys," Vol. VIII, 1857, Washington, D. C., Government Printing Office.
Dr. Harrison Allen, "Monograph of Bats of North
America," 1864, Philadelphia.
Coucs and Allen, "North American Rodentia," 1877,
Washington, Government Printing Office.
Coucs, "Fur-bearing Animals." (N. A. Mustelide), 1877,
Washington, Government Printing Office.
Caton, "The Deer and Antelope of North America,"
1878, Chicago.

Caton, "The 1878, Chicago.

There are other works, some of them illustrated, which are rarer and more costly than those mentioned above, but the student, with the information which he can obtain from any of those cited, will be in a position to select for himself what he wishes further. The books to which we have referred contain, moreover, the latest information that we have on the various groups of which they treat. Interesting papers on mammals are to be found scattered through the various Government Reports and supplementary publications that have been issued in such numbers within the past few years, as well as in the various publications of scientific societies, Turning now to the next class of vertebrates we find among the literature devoted to

BRDS.—Baird, Brewer and Ridgway, "History of North American Birds" (3 Vols., including only the "Land Birds," so called, Washington, 1874. (A fourth vol-ume devoted to the "Water Birds" was to have completed this work, but the cost proving greater than was expected, it has never been issued. We have understood that efforts have been made to print the fourth volume by myster subscription, and terret have fourth volume by private subscription, and trust they

fourth volume by private subscription, and trust they may be successful.)

Coues, "Key to North American Birds," Naturalist's Agency, Salem, Mass., 1872 (Indisponsable to the ornithologist or collector).

Coues, "Birds of the Northwest," 1874, Washington, D. C., Government Printing Office.

Coues, "Birds of the Colorado Valley," part 1, Washington, 1878, Government Printing Office.

Cooper, "Orithology of California," edited by S. F., Baird, Vol.1, "Land Birds," University Press, Cambridge, Mass., 1870. (Only one volume issued).

It is, of course, hopeless to attempt to enumerate any portion of the special ornithological papers and local lists which have been published, nor is it worth while to refer at length to the well known, but costly, illustrated works like the originals of Audubon, Wilson, Bonaparte, Swainson, Richardson and others. Cheaper editions of most of the latter have been published, who desires further information with regard to this subject can easily satisfy himself by referring to the ornithological bibliography which accompanies Dr. Coues' "Birds of the Colorado Valley."

It is scarcely necessary to say that the literature of reptiles is much less extensive than that of the birds.

few works, however, may be quoted.

EFFILES.—Holbrook, "North American Herpetology,"

5 Vols., Philadelphia, 1842. (A superbly illustrated REPTILES, -Holbrook.

EPTILES.—S. Philadelphia, 1842. (28 on P. S. Vols., Philadelphia, 1842. (28 on P. S. Vols.)

Bairdand Girard, "Catalogue of North American Reptiles," Part I, Serpents, 1853.

Agussiz, "Contributions to the Natural History of North America," Part II, North American Testudi-

North America, Furt II, North American Testindi-nata, 1857. Cops. "Check List of North American Batrachia and Reptilia." Cope. "Partial Catalogue of the Cold-Blooded Vertebrata of Michigan," 1864-5. Many minor papers in Government Reports and else-

where.

NORTH AMERICAN FISHES.—Jordan, "Manual of Vorte-brates," Jansen McClurg & Co., Chicago, 1879. (Con-tains imperiect bibliography).

GENERAL ZOOLOGY.—Packard's "Manual of Zcölogy." New York, Henry Holt & Co., 1879 (Other manuals by Tenry, Nicholson and Orton).

GENERAL ANATOMY.—Owen, "Anatomy of Vertebrates,"
Longmans, Green & Co., London, 1868. Huxley, "Anatomy of Vertebrated Animals," London, 1871. Huxley, "The Anatomy of Invertebrated Animals," London, 1877; J. A. Cluurchill, New Burlington street.
OSTEDJOGY.—Plower, "Osteology of the Mannmalia,"
Macmillan & Co., London, 1870. (Also' Huxley and Owen on vertebrates above cited).
RSECTS.—Packard, "Guide to the Study of Insects,"
Salem Naturalist's Agency.

Notes.—In an interesting article published in the Auburn Daily Advertiser, Mr. Frank R. Rathburn, well known to our ornithological readers as one of the authors of a most valuable list of the birds of Central New York. makes a very vigorous attack on the English sparrow The paper alluded to is in two chapters and is entitled "An Exotic Tramp." In his denunciation of the bird the writer makes use of some rather vigorous English, but it cannot be denied that the subject is one which calls for emphatic language. An interesting feature of the paper is the testimony from the various countries of Europe as to the grain-devouring proclivities of Passer domesticus, cited by the writer. Speaking of Algeria, he

The reports from this country are alarming. In 1877, it is stated, that on one estate alone 200 acres of ryo were so that the state of the source of ryo were strips, that not a single conto was harvested; and it was calculated that in a neighboring wood, some 150 acres in

extent, there were 284,000 nests.

. . . . The Yonkers Gazette of February 14th contains a paper on the same subject by E. P. B., whose initials are so well known to our readers that we presume it is not necessary to fill out the name. The article is written in a very temperate and convincing style, and deals principally with the utter failure of the sparrow to accomplish what was claimed for him on his introduction, that is, the reduction of our insect pests, and with its quarrelsome and noisy habits and the attacks which it makes upon our native birds. The writer refers at length to Dr. Coues' admirable paper on the status of Passer domesticus in America, and concludes by demanding that the bird be left to shift for himself and no longer be protected by special legislation or fed and petted above our native birds by kind-hearted and well-meaning but injudicious birds by kind-hearted and well-meaning but injudicious people. . . . Of quito another sort is an appeal printed in the Quebec Morning Chronicle and appropriately signed "Cock Sparrow," The writer takes occasion to warn the numerous friends of our innocent little fellow citizens, the sparrows, that the dangerous shrike or butcher-bird is "around" and is already committing havoe in their feathered ranks. This very afternoon the writer and another gentleman, while standing near the City Hall, were ope-witnesses to a butcher-bird carrying off a poor little sparrow in its talons, high over the houses in St. Louis street, having, it is presumed, pounced upon its pray among the trees between the City Hall and No. 1 Fire Statton. Externination should be the order of the day as regards the entire race of these feathered marauders. . . Dr. Paul B. Barringer, in a letter to Dr. Coues frinted in the March Naturalist, and dated Dallas, N. C., printed in the March Naturalist, and dated Dallas, N. C. announces the advent of Passer domesticus in that State . . In the February number of the Naturalist appeared a most valuable article on The Convolution of the Trachea in the sandhill and whooping cranes, from the pen of our valued correspondent, Mr. T. S. Roberts. The writer gives an admirable description of the course of the traches in Grus canadensis, that of G. americana having been already described by Dr. Coues in Forest and Stream and in "Birds of the Northwest," and gives excellent figures of the sterna of the two species with the side removed so as to show the course of the trachea in sach. Mr. Roberts' descriptions and figures are so exseedingly suggestive that we cannot but hope that further investigation may give him results which will prove nost interesting, if not startling.

Signs of Spring .- Mr. John H. Sage writes us from Portland, Conn., that Quiscalus purpureus appeared there Feb. 20th, and that this is the earliest date of which colectors there have any record. . . . From Perth Amboy, V. J., J. L. K. writes, under date of Feb. 27th: "Crow-lackbirds made their first appearance here to-day.". 'rom Baraboo, Wis., comes the following note, dated b. 26th: "A few bluebirds have made their appearnce, and also a few flocks of mallards have found heir way to the Baraboo River, which is now free from ce,"... We take the following extract from the teur naturalist informs us that a night or two ago ie heard the notes of a woodcock in a rural portion t Portland. This bird usually returns to us in the spring, ut not before, and his presence here now is most retarkable. It is also noteworthy that we have had robins ere every morning during the present winter, which ave also been heard singing. The red-berries, of which hey are so fond, have been very plentiful. uort walk in the woods on Saturday, Feb. 28th, re-saled the fact that the catkins of the alders are about adv to open, and that the skunk cabbage (Symploarpus) is in bloom. The song sparrows, bluebirds and adwing-blackbirds are apparently getting ready to go bloosekeeping; the buds on the elms are swelling and warm wet spots the grass is becoming green. No oubt we shall have some cold and stormy weather yet, it really spring seems very near at hand,

Editor Functional Stream:—I have recently taken great
interest in tille shorting, and therefore have become a
reader of your valuable and interesting paper, feeling I
cannot become a slidfluf rilleman without availing myself of its useful and instructive articles upon all sports
in general and guns in particular.
In your last issue I noticed an item relating to the
mildness of the winter in Iowa. I think I can tell of
something more remarkable. On the 30th of last December I was out shooting crows along the "Shrewsbury
River, Now Jersey, in order to test a new double rifle I
had just purchased. On crossing a swampy hollow,
through which ran a small brook, I came upon a large
garter snake swimming in the water. It remained through which ran a small brook, I came upon a large garter snake swimming in the water. It remained motionless when it saw me, so I shot and killed it. This is the first instance I have known of a land snake taking to water, and that, too, in the middle of winter. On my return I ran upon a little yellow dandelion, growing fresh and bright as in summer, and also saw several blue-birds, which had avidently been deceived by our mild winter, and imagined spring was at hand.

If you deem this worthy of notice, you may make an item of it.

Our correspondently, obscavations are well tworthy of the state of the stat

Our correspondent's observations are well worthy of record, and we are glad to print them. That the snake should have been about at such a date was certainly remarkable. There was nothing very surprising, how ver, in finding it in the water.

The dandelion was scarcely less out of season. It was the last of its race, no doubt. We plucked one in full bloom Feb. 15th, in a hard snow-storm,

ALBINOS IN CALIFORNIA.—Nature seems to have played some strange freaks among the feathered tribes this season. Naturalists and dealers note the arrival of many game birds and other species that have exchanged their original plumage for one of white. A tone naturalist's several curious birds may be seen. Perhaps the most uncommon is a little green-winged teal which came in a few days ago among a shipment of other birds from up the Sacramento. It is of an ashy color on the back and has a white breast. The green spot on the wing is changed to a dark color. A female widgoon that came in recently from up the Ban Joaquin River is of a bright chocolate color on the breast, while the back is of an ashen hue. A mudhen shot at Borden Island about two months ago is mottled on the back, laving white spots scattered through the usual coat of black. The breast is of a blueish cast, with small white feathers intermixed. The crown and sides of the head are blue and white. A pair of valley quall were recently shot by George Elkerenkatter, of Scarsville, San Metro County, that were white all over the body, with the exception of the markings on the breast, which retained their wonted color. A brown and white salt marsh rail, killed at Alviso a few months ago by a sportsman of this city, is another freak of nature never before heard of, naturalists say. Another is a white robin which came in some time ago. This bird is nearly all white with an occasional black feather,—San Francisco Chronicle, Feb. 7th.

Rallus Elegans in Connecticut.—On Sept. 17th, 1879, I secured a fine female Rullus clegans, which was killed here in one of our marshes by a gentleman who was shooting the common rail.

As the examples of this bird in New England are not many, we think the above worthy of record.

Jno. H. Sage.

Portland, Conn., Feb. 28th.

ACCLIMATIZATION OF WHITEFISH IN NEW ZEA-LAND,

U. S. Commission, Fish and Fisheries, Washington, D. C., March 4th.

Editor Forest and Stream :-

I send you for publication in Forest and Stream, if you think best, the following slip from The Press, of Christ Church, New Zealand, of January 19th. This details a very successful experiment in the transmission of white fish eggs, by Mr. Frank N. Clark, of Northville Mich., and as such should be permanently recorded.

SPENCER F. BAIRD.

as such should be permanently recorded.

SPENCER F. BAIRD.

The history of the first attempt and failure to introduce American whitefish into New Zealand is well known; but undanted by the loss of the first consignment, fresh negotiations were entered into by the Government through Mr. R. J. Creighton, of San Francisco, the result being a complete success—that is to say, up to the landing in prime condition of the ova, which arrived by the last California mail. The boxes containing the ova arrived in Auckland by the Australia on the 11th inst. They were at once transhipped into the Hinemoa by Mr. Firth of that city and arrived in Lytelton early on Saturday morning. A list of the various places in the colony and the quantity of ergs assigned to each, has already been published, and the box whitch Mr. S. C. Farr received on behalf of the Canterbury Acclimatization Society, contained approximately 300,000, but the number will be diminished from unavoidable causes, to the extent of about five per cent. By the kindness of Mr. Conyers, Mr. Farr went down to Lytelton on Saturday morning by special train, accompanied by the Society's curator and game-keeper, and brought the consignment up to the gardens. No time was then lost in unpacking them. Thanks to the careful manner in which they were packed by Mr. Clark, the ova arrived in splendid condition. They were contained in five smaller boxes and packed in two layers, each box having at the bottom a bed of soft moss, and over the moss was laid a piece of while screen. Upon this the eggs were listed, and which was made expressly for the purpose, was constructed with false sides and bottom, the

spaces between being packed closely with sawdust. All the interstices between the small boxes and the sides of the chost were picked with ice, thus preserving the same temperature thoughout the journey. Further protection was given by means of thick felt at the top and bottom of the chest. The small percentage of loss was due to the moss falling throught in some places, which occasioned pressure outsome of the eggs. No time was lost in placing the own into the hatching boxes, the water, by means of ice being brought to a temperature of \$2 degrees. All the damaged eggs were picked out. Dr. Hector visited the gardens and took great interest in the proceedings. He expressed himself warmly to Mr. Farr on the excellent arrangements generally, which he said he would communicate to the Government. So far there is no room for doubt as to the ultimate success of the experiment, at least in Canterbury, and if the other societies who share in the general distribution of the ova are equally careful, the colony generally will be enriched by a most valuable addition to their varieties of fish. Under ordinary circumstances two months would probably clapse before the eggs would be hatched out, but this time will in all likelihood be considerably shortened the water in the hatching boxes being at a higher temperature than those in which the ova wore brought from America, the conditions are more favorable for an early development of the young fish. The greater proportion, when sufficiently matured for distribution, will be placed in Lake Coleridge. Mr. Johnson, of Opawa, also received a case of the ova, which the injury from vibration. An additional box of ova arrived in the same chest, to Mr. Johnson's private order from America.

The colony, in the first place, is greatly indebted to the spaces between being packed closely with sawdust, the interstices between the small beautiful and the sawdust.

rived in the same chest, to Mr. Johnson's private order from America.

The colony, in the first place, is greatly indebted to the knowledge and experience of Mr. Clark, of Northville, Mich., who collected and packed the ova, for their safe arrival in New Zealand, and secondly to Mr. R. J. Creighton, of San Francisco, who from the first has shown a kaen interest in the success of the experiment.

LIVER-FED FISH,

k LIVER-FED FISH.

WE scarcely find a paper in which something is not said of liver-fed hish; and from the general tenor of numerous contributions one would be led to supposs that fish fed on this aliment were not only inferior in quality, but that they were actually flavored with the sessence of liver. How frequently we read of the glorious trouting fours by which the participants were enabled to regale themselves on the wild, toothsome brook front, taken fresh from the limpid waters of the puring brook. So far, very good. Undoubtedly this magnificent little fish can be eaten with relish at all times, and more especially so after exercise in the pure, free, open air. But when, added to all this, I am informed that these native denizers are superior to their cultivated brethren on account of their freeness from the taste of the everlasting liver on which the latter are continually fed, I ask to be permitted to enter my protest. And right here the thought suggests itself, is not all this assumed difference in the taste of the wild and cultivated fish a mero matter of imagniation, suggested from the fact that it is generally known that pisciculturists usually feed their fish on liver? Who is there actually engaged in practical pisciculture that has not, by reason of their frequent pisciculture that has not, by reason of their frequent handling of liver in feeding, learned to ablor it as an article of food for themselves, no matter how fond they have been of it in the past? Certainly the actual taste of liver has not changed, but the change is only mental. As illustrative of the imagination in producing liver tastes, I will give an incident related to me by lir. B. F. Shaw, our State Fish Commissioner. It is as follows:—

A valedudinarian and her daughter were staying at the resort of Mr. H. F. Dousman, a tront culturist, at Waterville, Wiss, where she hoped to regain her health by obtaining the pure country air and feasting on brook trout. For some time the trout were cated wome newspaper, stating how cultivated

that the old hay left the place soon after discovering her mistake.

In the writer's opinion, many of those porsons who can so readily discern the taste of liver, would also discover some disagreeable taste in Lancellibranchs, such as oysters, clams, etc., did they know that these were organized creatures, with alimentary canals, stomach, etc., as would also be the case with the native fish, were these parties intimately acquainted with the food consumed by them in their native waters. But let us inquire why should fish fed on liver taste any more of their iood than those which feed on the slimy worm or any other substance? There is nothing in good, fresh liver which, when taken into the stomach, generates deleterious gases,

to be absorbed by the membrane of the intestines, and thus carried by means of the absorbents into the blood. The liver is a lobulated gland, and each lobule has its veins, arteries, capillaries, nerves and absorbents. Being thus organized, it has the same means of building its substance and carrying off the impurities as the muscular fiber and other portions of the body. But, it may be said, the liver is that gland by which the bile is secreted, and may not that affect its food qualities? Why should it? Is not this very bile absolutely necessary to digestion? And again, how is this bile secreted? It is from the veinous blood, and carried to the gall bladder, which forms its reservoir, which is not used as feed. In chylelification no substances are combined, and thus absorbed into the system, excepting those that are necessary for its sustenance (unless it should be gases); those that are not thus necessary are passed off as the fecal discharge. Hence, in determining the quality of food for a given animal, we must consider its natural food, as to whether it is vegetable or animal, and what ingredients are necessary for its sustenance, as albumen, fibrine, sugar, etc. Now, it has been ascertained by analysis that liver contains albumen, fibrine and casin, and that it elaborates from the blood liver sugar, all of which makes it a most excellent pabulum. Of course I do not mean to be understood as advocating liver as the sole food to be used. I believe in a variety of food, but I contend it should be that, principally used, and that there is no article of food that will produce a greater growth or filst of fine flavor. Why not? The feets if must be of fine flavor. Why not? The feets if the must be of fine flavor. Why not? The flesh is firm. The growth being rapid, the fish is fat. The curd (small portions of fatty matter between the flakes of the flesh) is well developed, and 1 ask how can your fish be other than of fine flavor?

American Fish Cultural, Association.—The minth annual meeting of the American Fish C to be absorbed by the membrane of the intestines, and

AMERICAN FISH CULTURAL ASSOCIATION.—The ninth annual meeting of the American Fish Cultural Associa-tion will be held at the Directors' room of the Fulton Mar-ket Fishmongers' Association on the 30th and 31st of

March

The scope of the association has gradually widened. At first it owed its support to trout-raisers only, and formed a protective union; to-day it embraces all questions relating to our fish and fisheries, both sea and inland, whether of their culture, preservation, habits, or capture for profit and pleasure, and it has now a membership of over two hundred, comprised of naturalists, fish culturists, fish dealers, fish commissioners and anglersall of whom are directly or indirectly interested in increasing the fish resources of the country, either by scientific study or practical experiment.

FISH IN SEASON IN MARCH

Pompano, Trachinousearolinus, Grouper, Epinephelpus nigrilus.
Drum (two species). Family
Seiomider, Trout (black bass), entropresses
Kingfish, Mentleirrus nehulosus.
Stat Pass, Scievings wedlatus.
Sheopshead, Archosaryus probalocephatus.
Snapper, Lutianus black finad.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory of Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value: State, Town, County; means of access; Hotel and other accommodations; Game and HS Season; Fish and HS eason; Boats, Guides, etc.; Name of person to addre

FREE FOR TWENTY-FIVE CENTS.-The following list of lucky fishing days is given to the readers of the Forest AND STREAM confidentially and free of charge. To all others the Canadian genius who invented it makes a charge of twenty-five cents. He claims, too, that the prediction is well worth the modest price asked for it. the men who observed his dates last year, now testify to the reliability of the predictions. This year the lucky fishing days will be as follows, water and weather being favorable :-

March 11th, 12th, 13th, 14th, 15th, 16th; April 7th, 8th March 11th, 12th, 13th, 14th, 15th, 16th; April th, 8th, 9th, 10th, 11th, 12th, 13th, 13th, 14th, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 30th, 31st; June 1st, 2d, 3d, 4th, 5th, 6th, 28th, 29th, 30th; July 1st, 2d, 3d, 26th, 27th, 28th, 29th, 30th, 31st; Aug. 21st, 22d, 23d, 24th, 25th, 26th, 27th, 29th, 30th, 19th, 19th, 20th, 21st, 22d, 28d; Occ. 15th, 16th, 17th, 18th, 19th, 21st, 22d; Nov. 12th, 18th, 4th, 15th, 17th; Dec. 11th, 12th, 14th.

Dec. 11th, 12th, 14th.

Vermont-Sheldon, Feb. 26th.—A few years ago this place was noted for its mineral springs, and still further back as a country abounding in fish and game, but now its glories have nearly departed. Its mineral waters are mostly used for washing purposes. Nearly as good as rain water, old women say. Small speckled trout are to be found in the brooks a few miles back in the interior. The creek which runs through the village now furnishes only pickerel fishing, but we hope to soon have something better, as one of our local sportsmen, Mr. Henry Caseau, has made an attempt to stock it with black bass and perch. Franklin Pond, a body of water somethree miles by one mile in size, is situated a few miles northeast from here, and at certain seasons of the year gives good sport to the base-fisher, and good sport the year round to the perch-snapper. A heautiful body of water called Fairifield Pond (Silver Lake) lies a couple of miles southwest from this village. These waters contain speckled trout and land-locked salmon. Its waters are well adapted for these fish, and if protected against pot-hunters, who sweep the spawning beds, it would afford as much or more sport to the same size (3xa miles) in the State.

STANSTEAD,

Massachusetts,—Duxbury, March 1st.—The fishing here in proper season is for cod, smell, mackerel, perch, fresh and salt water; taulog, trout, pickerel, catifish or horn pout, lobsters and the renowned Duxbury clain. Grouse.

ONONDAGA FISHING CLUE.—The annual meeting of the Onondaga County Fishing Club, of Syracuse, N. Y., was held last Thursday evening. The old officers were reclected for the ensuing year as follows: President, Reuben Wood; Vice President, Alexander H. Davis; Secretary, F. S. Wicks; Treasure, W. C. Anderson. The executive committee of five was also reflected.

The club resolved to procure young trout from the State hatchery for the purpose of stocking the waters of Onondaga Creek, at an expense not to exceed \$29, the fish to be deposited in the creek under the direction of the executive committee. The club's appropriation for stocking Onondaga Creek is sufficient to secure 30,000 young fry. The efforts of the Association in this direction will be highly appreciated by all who enjoy angling. During the meeting an extract was read from the proceedings of the New York Sportsmen's Club highly commending the work done by the Onondaga Fishing Club in protecting the waters of this county.

TENNESSEE.—Savannah, March 2d.—Our fishing season began last week by a couple of early anglers taking twelve fine bass. They reported the fish sluggish and not inclined to feed. Since then we have had heavy rains, and the streams bass. They reported the fish sluggish and not incured to feed. Since then we have had heavy rains, and the streams are full and muddy, proventing fishing. I head recently of a small fish unlike any other before seen there, being are tull and muddy, prevening issuing. I measurecensy of a small fish, unlike any other before seen there, being caught in Buffalo River last month, which was believed to be one of the California salmon put in that stream last March. It measured some four or more inches in length, and was caught on a hook by a "perch fisherman," After being carefully examined it was restored to the stream. While

WILL.

MICHIGAN.—Traverse City, March 2d.—Traverse City is fast becoming one of the most popular of summer resorts. Easy of access, both by land and water, it is a place that is the joy of the heart of any sporting man. Here, in their senson, you will find deer, rabbit, foxes; brook trout by the million, Mackinaw trout in the bay, black bass in the inhand lakes, quantities of pigeons, and, in fact, almost anything that will help to kill time for the sportsman. Fine hotel accommodations at the Park Place at a very reasonable rate.

Fied.

NEBRASKA BASS FISHING. - Omahat .- I give the first Nebraska Bass Fishing.—Omdha.—I give the first bass caught in Nebraska in 1890 of sufficient size to justify publication. It was taken on the 25th inst, sixteen miles north of this city, and was weighed on the day following on a Fairbanks' counter scales in the presence of several other persons and brought the scales down at six and a half pounds plus. This fish, Micropterus satmoides, is the largest one the writer has ever seen, and no doubt the largest ever taken in Nebraska. If a larger one is taken during the year 1 hope it will be reported to the FOREST AND STREAM.

BOB WHITE.

THE MUSKOKA LAKE COUNTRY.

I would invite every one that could spare the time to try the Muskoka country, Ontario, where fishing and shooting, in their seasons, cannot be excelled. For speckled front Islaing, the South Branch of the Muskoka is A1. The head waters of the Magnetawan River are hard to beat for the speckled beauties, and the Naminataygong or South River will hold its own with any of them. Then for maskinonge, the Muskosh and Moon rivers are first-class, and I can safely say that French River cannot be beaten for maskinonge, pike and pickerel; and hikes Rosseau, Joseph, Spider, Turtle and Manitowaba, and the hundreds of other smaller lakes cannot be touched in the whole Laurentian country for black bass lishing. In the autumn deer are plentiful, partridge are found everywhere. Moose are killed in the vicinity of Lake Nipissing in good numbers, also wild geese and ducks. I would invite every one that could spare the time

are found everywhere. Moose are killed in the vicinity of Lake hipsising in good numbers, also wild geese and ducks.

The routes to reach these sections are as follows: Leave Toronto per Northern Railway to Gravenhurst, thence by steamer to Bracebridge, and then by stage fourteen miles to Baysville, on Trailing Lake, for trout fishing on the South Muskoka and North rivers.

For maskinonge fishing on the Muskosh and Moon rivers, take the steamer from Gravenhurst to Bala. For bass fishing on lakes Rosseau, Joseph and Turtle, take steamer from Gravenhurst to "Pratt's." For trout fishing on the Maganetawan and the Naminataygong, or South River, take stage from Pratt's to Maganetawan Village thirty-seven miles, and for South River, stage it twenty-four miles further north to Commonda. For bass fishing on Spider and Manitowabah lakes, take stage from Pratt's to Parry Sound, twenty-four miles; and for French River, take steamer from Parry Sound to French River, take steamer from Parry Sound to French River, take steamer from Parry Sound to French River, take steamer from Parry Sound to French River, take steamer from Parry Sound to French River, take steamer from Parry Sound to French River, take steamer from Parry Sound to French River and if the sportsman is not too thinskinned, while the black files and mosquitos are browsing around, he will enjoy himself immensely, as hundreds have done before him. Guides and canoos can be had at all the different places mentioned. Any person or "arty wishing for further information, I will be willing and ready to give it.

**Proven Round Out. Peb. 27th. McGuefin

and ready to give it. Parry Sound, Out., Feb. 27th.

Parry Sound, Ont., Feb. 27th.

The Missiona Lares.—Quebee, Feb. 29th.—Editor Forest and Stream.—A very pleasant summer trip can be made at very small expense to the back lakes of Muskoka from almost any part of the Northern States. This country is as yet virgin forest, broken by mountains and dotted with small lakes from the size of a fish pond to some of miles in area. All these last are full of gray salmon trout from three to nine pounds in weight, and also of the genuine Salmo fontinutis, which, allow me to say, is not a poor liver-fed specimen of his race, but splendid, gamy feilows: many of them will tackle a balance of five pounds draught. I myself have caught them of this weight several times, and trout from one to three pounds, and so plentiful that they cease to be sport after a time. The route: Go to Toronto, take the Northern Railway to Bracebridge to Baysville, distance twenty miles by wagon, fare according to number of party, average price \$1; take hoat to Phillips, at head of lake, fure about sam; then get Allen, or Alven Phillips, to guide. They are both first-class men, and know all the country for 150 miles around.

They are hunters and trappers by business, and also make cances, buckskin moccasins, etc. Average price for three weeks about \$30 acach for party of, say three, not counting fare to Toronto, from point of starting. For a larger party the expense is proportionately less. Of course this amount only covers the necessaries; it can be applied to the proposed to the second course of the Resetting. made larger at the option of the parties going. Best tin from 15th May to 15th July, Au Sauelle. Best time

PRINCE ARTHUR'S LANDING, ONTARIO.

DRINGE ARTHUR'S Landing is situated on the north shore of Lake Superior (200 miles northeast of Duluth), in the District of Algona and Province of Ontarlo, Dominion of Canada. It is within eighty miles by water of Nepigon River, the celebrated trout grounds, and may be reached from Duluth by the steamers of either the Collingwood or Sarnia Lines, two boats of each line leaving Duluth every week during the season of navigation; or nearing Juntua very week uning intersection in lavigation, or the traveler may come by the same lines from either Sarnia or Collingwood—these places being reached, the former by the Grand Trunk and Great Western railways of Canada, the latter by the Northern and Hamilton and Northwestern railways of Canada.

There are two first-class hotels at Prince Arthur's Landing, viz: "The Queens, James Plaherty, proprietor, and "The Pacific,"
John P. Vigars, proprietor. Board from \$1.50 to \$2 per day; reduced rates by the week or month. Sail-boat and man may be had for \$3 per day. In addition there are three steamers which may be chartered at from \$15 to \$30 per day, to convey tourists to may be chartered at troit \$15 to \$30 per day, to convey tournals to Nepigon and the outstanding trout streams, of which there are —Carp River, fourteen miles south of Prince Arthur's Landing; Mackenzie River, fourteen miles northeast, and Blende River, twenty-live miles in the same direction from here, while McVia-er's Creck empties into the buy in the outskirts of the twom, and Current River, two miles from here. On the latter streams good fishing may be had by walking out them two to three miles. An other creek crosses a colonization road (the Dawson Route) sis miles out, and still another river (Neebling) crosses the Oliver town. ship road six miles out. The latter stream has hardly ever been solp root ax interested in the factor action in a many even entitled in fails, both of which there being no access to the same till has fail, when the road was built. Of all those streams Carp River is profused to the fail of the fail needs are required to fast any of these streams. In the trust gar-son from May 15th to Sept. 15th. Good sport trolling for pickere, and pike of large size may be had at any time in the Kaministi-quia, three miles from here; while from Sept. 1st to det, lat any quantity of salmon trout may be caught trolling in the bary adjoining and in Thunder Bay.

Partridge and duck shooting may be had, but to a limited

ratified and under shooting haly be had, but to a limited extent, from Sept. Ist on to close of navigation; and during what for months earthout shooting is to be had within twenty nifles But unfortunately we are almost luncessible after navigation closes, as we have no railway until the Canadian Pacific is limished. which will be in three years. I need not speak of Nepigon, which is already so well known t

the numerous readers of Forest and Stream, but I would sat this word of warning to those going there, viz: Never buy ticket to Nepigon, for the steamers sedom call there, although The sportsman's best plan is to purchase a tick to Prince Arthur's Landing only, and if he decides on going to Nepigon to charter one of the steamers or a sail-boat and g from here there. This will save numerous disappointments and the probability of heing carried all around. Lake Superior befor

being landed at Nepigon, if at all.

Provisions and supplies of all kinds, including tents, may rrovisions and supplies of a nature, including tents, may of purchased here, but sportsmen would do well to bring their ow tackle, as the supply of rods, hooks and lines would not satisfy veterun or even a scientific fisherman.

Indians and canoes may be had in abundance, there being a

Indian settlement of 200 six miles from here. Any questions whose cheerfully answered by inclosing a stamp to me at Princ Arthur's Landing, Thunder Bay, Ontario. GEORGE T. MARKS.

VARNISHED FLY-RODS AND CASTING SIDEWAYS. -- France

Francis is deserving of attention when he talks about th practical art of fly-fishing, and we accordingly reproduc from our English contemporary the following hints:-I have often pondered on the subject of varnished fit rods, and wondered why we tamely submit ourselves I the tyranny of tackle-makers on such a matter. Who ha not seen the flash of a rod half a mile away? And whe such an astonishing thing as a flash of this kind is principled on to the water, that it should not fill with analyse to the water and even the present and even to great the present of see the water.

not seen the history of an an infine away? And who such an astonishing thing as a flash of this kind is prejected on to the water, that it should not fill with amaze ment and even terror the perceptions of so shy a creating as a downy old. Humpshire trout, is hardly to be expected. What angier of any experience has not ofte seen trout bolt in a sudden scare up under some weed a bank when he has essayed to cast for them, where produced a summary of the seen trout bolt in a sudden scare up under some weed a bank when he has essayed to cast for them, where produced this cause? Anything more calculated to catch the error of a fish than a black or mahogany-colored pole from feet to 15 feet long, varnished so brilliantly that you can almost see your face in it, and waving about over wheat wildly where he is not accustomed to see anythin of the sort, cannot well be conceived. There are in the matter two things to be considered, viz., first, we should you wave it over his head at all? and, second why should it be black and shining? One of the band most successful trout-fishers I know casts sideway that is, his rod is rarely upright and seldom over the water—projected at an angle of 45 degs. or thereabour from the body; the rod is checked as soon as it is about or each the margin of the water; and I am quite such a such as a such a such as a s which shall replace it? I should like some one better in these matters than I am to give me some advice he Would it do to varnish the plain wood without color, a then, after giving it a light rub of sand-apper so ac-rough it, slightly to paint it over some assoky or sky-bi-color? The question is, what color would show le

against the sky or cloud? I mean to try something of this sort, but I should like to try that which has the best chance of success. Francis Francis.

Salmon-foisoned Dogs,—Portland, Oregon, Fcb. 12th.—In a recent issue of your valuable paper you published an article from your Corvallis correspondent in relation to salmon-poisoning of dogs. The writer stated correctly and plainly this strange disease, or rather affection; but in a later article he writes, among other interesting additions to his former article, that he does not know of a distinct of the property of the prope and plainly this strange disease, or rather affection; but in a later article he writes, among other interesting additions to his former article, that he does not know of a case of poisoning by salmon or mountain trout. I have seen such a case, which resulted fatally to the dog affected, but it was from the entrails of the salmon trout. The circumstances are as follows: While fishing in company with a friend in M. Creek, about thirty miles from this city, we caught quite a number of fine salmon trout, and when we returned to the house where we made our beadquarters, we cleaned our fish preparatory to packing them in our creos for transportation home; while we were this engaged, a large and fine-looking deer-hound would come up occasionally and after smelling around a bit, would swallow the offal of as many tish as we had cleaned at the time; he took in all of the entrails of eight or ten of the fish, and then his appetite for them seemed to be satiated. The next morning he seemed unveil, and by hoon he was continually coughing and retching, caused, I suppose, by an acute inflammation or irritation of the lining membranes of the resophagns; his nose was hot and feverish, at times he would drink water with apparent relish, but would soon vomit it up, together with a small quantity of bile, enough to give to the matter thus thrown up the characteristic yellowish color of the above mentioned secretion, and showing conclusively that the digestive apparatus was out of order and one of the causes of the sickness. By evening he was in much distress, his eyes looked sunken and hagard, his coat was ruffed and had lost its gloss, and he began to look emaciated, although in good condition when he partook of the offal, which, by the way, he could not have taken because of any great degree of hunger, as he was well cared for and used more as a watch-dog than as a hunter. As I returned to my home the following morning I was unable to watch the progress of the case, but learned that the dog died three days after I left. I had setter eighteen mounts one, and the other an Esquinainx or Kanischalka dog whose exclusive diet almost was fish—chibs and suckers—which I would catch for him, but when it came to salmon, which I fed him, supposing of course that it would not affect a dog who lived, as it were, on fish, he went the way of all good dogs.

MULTNOMAH.

The Pacific Life, speaking of this salmon sickness, says that the hunters of California and Oregon prevent the trouble by feeding salmon to nursing puppies, and it does them no harm to eat the fish afterward.

A BOAT IN THREE HOURS.

PITTNAM, Feb. 27th.

Editor Forest and Stream:—
As some of your readers may not have the money to spare to buy, or the conveniences to build a boat, I will describe how, without money, I made one of the best cloth boats I ever saw. I without money, I made one of the dest cioth boats I ever saw. I had recently returned from the Upper Missouri and had often been in a "bull-boat," made from the green hide of a buffalo. I lived near some splendid ponds abounding in trout and other fish, and had neither money nor cedar. I found some good hogshead hoops; I selected the best one; and then taking two strips of board fashened them to the keel hoop, which had been opened out so as to form a backbone, how and stern, to keep it upright. out so as to form a backhone, now and stern, to keep it uprigni.

I then got about thirty good barrel hoops and tied them all along
with stout turred twine to the keel hoop, and two more bogshead
hoops, which were tied one end of each to an end of the keel hoop, and then bringing the other ends round fied them to the other end of the keel-this made the side or rail. The ends or tops of the end of the Keel-tus manutes are or rail. In clear or rope of the hard hoops, the hard hoops and it loops, the hard hoops and it loops are so good in ownspanes together and laid them on the skeleton to got a good pattern, and the three hard the seven was put in an and over the frame, and the three houses are not so the seven was put on and over the frame, and with some old paint; I gave it a good thick coat and allowed it to dry in the sun. Thus in three hours, from the time the keel was laid, my boat was completed. The same afternoon I made my paddles, and next morning, although the paint was not dry, I could wait no longer, but, taking it upon my shoulders, was away for the pond. It was as tight as a bottle, and many a fine string of trout I caught with it. I used that boat about two years, and sold it to a couple of fellows for three dollars.

G. F. W.

OUR LONDON LETTER.

TWYFORD, Berks, England, February,

Twyrond, Berks, England, February, Editor Forest and Stream:—
As I write, though February is well begun, King Winter rules us with as firm a sway as ever. Water freezes fifty times a day in the kennels, and it is impossible to wash a dog without endangering his life. But for long-coated dogs the daily use of a wide-toothed brush and a metallic comb serves every useful purpose, so long as they get plenty of exercise.

There are, of course, no dog shows of importance at present in this country, and men are illing up their leisure time by squabbling in the sporting press and pulling each other's dogs to pieces. There is some very hard hitting too, I assure you, for be they "gentle or simple," none fight with such vim and maliciousness as men of the canine world.

In your impression of Jan. 15th I find a Mr. G., Flush-

the canine world.

In your impression of Jan. 15th I find a Mr. G., Flushing, L. I., requesting information about a puppy (pointer) with crooked legs. Of course if, as you presume, he has been kenneling in a barrow, and tying up his puppy, the legs will have become mechanically crooked. On the other hand, the crookedness may be due to a ricketty condition of the bones. This would, in a sporting puppy, hardly admit of a cure, and the quickest plan to get rid of the disorder would be to destroy the day. Here are a few facts I have geined by experience; 1; The disease is

most common in high-bred dogs. 2. And in those that have been much bred in-and-in. 3. Cold is often an exciting cause, and especially the cold of a damp kennel. 4. Bone meal and Parrish's chemical food given to the

4. Bone meal and Parrish's chemical food given to the bitch while carrying the pups is a preventive. 5. The treatment consists of plenty of good food, with bone meal in it, iron tonics, cod-liver oil, line-water and milk, exercise, pure air and friction to the limbs.

In the same journal W. J. P., of Daubury, says his dogs have distemper; that they have inflamed throats, drooping of the jaw, and die in a few hours. This sounds terribly suspicious, for the symptoms W. J. P. names point to dumb rabies in some form. Danbury vets should see to it. I see you prescribe chlorate of potash in the earlier stage of distemper. I'm glad of this, for I myself have found this salt, in conjunction with a little of the bicarbonate and the nitrate of potash, almost a specific if taken, or rather given in time.

bearbonate and the intrate of potasis, almost a specific if taken, or rather given in time. I should have mentioned that bone meal is nothing more or less than fresh bones—not tooth-brush handles—well pulverized. I believe I was the first to suggest its use in this country, and it is now generally employed as a natural adjunct to dogs' food. Spratt's firm make it here.

here.

By the way, I have heard a deal more about the new German biscuit furce—''Macdona plus ye German prefessor.'' The story is amusing, and if you'll grant me a corner in your next or next. I'll give it. Mcanwhile, I may tell you the English public have not been gulled by this wonderful ''cheap food for dogs.'' May the Lord keep it far away from my kennels, but send me Spratt galler!

tous wondertul "cheap food for dogs." May the Lord keep it far away from my kennels, but send me Spratt galore!

I read with great interest an article of yours on beardogs. I am fully of the writer's opinion when he says the Scotch terriers would make admirable beardogs for your canebrakes. I have no knowledge of bear-hunting in the States, but having been out in Greenland for a year or two I have enjoyed some splendid sport with the great Arctic, or Polar bear. He is probably three times as large and at least as ferce as any grizzly I ever read of. But we would never think of slipping any large breed of dog on him. The following account of a bear-hound called Brick is taken from my last book entitled "Ladies" Dogs." It may be of interest to you.

"Perhaps you never heard of a breed of dog called the Greenland bear-hound. Be it mine to enlighten you. Brick was the most useful dog, either on the ship or on the ice, that I ever met with. He wasn't by any means a large dog. As far as I can recollect, he appeared to be a breed between a large skye and a Russian retriever. From this you can form some notion of his size, his shaggy coat, his gamesomeness, his pluck and his swimming powers. But it was on the ice after all that Brick showed to the greatest advantage, and fully proved his claim to the rather high-sounding title of bear-hound. Brick had been so often to Greenland that he seemed to know all about everything connected therewith. When his master, rille in hand and fully equipped, came on deck, Brick jumped at once on to the capstan, and thence sprang upon the dector's shoulders, and so got safely and seintifically over the side.

"Brick enjoyed the scaling, even when there were no begra about, but at the heels of Bruin, Brick was quite in

scientifically over the side.

"Brick enjoyed the scaling, even when there were no bears about, but at the heels of Bruin, Brick was quite in his element. The skipper assured me that by this doy's agency alone three or four bears at least were bagged overy year; and before this voyage was over I had ample opportunity of sceing that this statement was in no away synagraphs.

agency alone three or four bears at least were bagged overy year; and before this voyage was over I had ample opportunity of seeing that this statement was in no way exaggerated.

"A large dog would have had no chance with a Greenland bear—not the largest dog that ever walked on four legs; for any dog of large breed would instantly close with the bear, and be torn to pieces in a few seconds. But Brick knew a trick worth two of that.

"When this dog saw a bear upon the ree he at once gave the alarm, and then went after the enemy 'like a strenk of greased lighthing.' And here was Brick's method of bear-hunting. When Bruin ran, Brick bit Bruin's heels. Bruin, enraged, wheeled round to demolish Brick. Brick langled in Bruin's face, keeping out of the way all the same, so Bruin lost precious time, and the guns got alongside."

And now to conclude this short letter by mentioning another matter. The dogs I have sent out to the States have given great satisfaction. This gratifies me much. In numbers they have been few, in quality good. The seeing of a dog fairly started causes me no small anxiety expense and trouble. Were I less sensitive in mind I might avoid this by starting the animals from my own railway station, but if I let any poor dog go like that I wouldn't sleep for a week. So I nutlee the journey (thirty-three miles) to London the day previous to the vessel's sailing, cab it over the city, and train it next morning to the docks. Then there is the butcher—not only to pay, but often to bribe. I also never fail to make friends with some kind-hearted passenger, who, as a rule, promises delightedly to look after the export. Having seen the ship off, I've done all Lean. But I often wish I were going along with it. And so I have promised myself in June or July a little run to New York. Baltimore, etc. ose how dog matters stand in the States. This is a chance I think your readers who may wish good pedigree dogs should not miss. These are as follows: Beagles, Benheims, King Charlesse, bull terriers (either benchers)

TWO ANECDOTES ABOUT COLLEY DOGS .- Over forty years ago there was a delightfully illustrated book pub lished in London by Edward Jesse, author of "Gleanings in Natural History," from which we reproduce the following accounts of the wonderful instinct of the now fashionable colley dog:-

mande comy and :—
The owner of a sheep dog having been hanged some years ago for sheep-stealing, the following fact among others respecting the dog was authenticated by evidence on his trial. When the man intended to sixed any sheep he did not do it hilligially but dothered his day by the bis

business. With this view, under pretence of looking at the sheep with an intention to purchase them, he went through the flock with the dog at bis heels, to whom he secretly gave a signal so as to let him know the individuals he wanted, to the number of ten or twenty out of a flock of some hundreds. He then went away, and, at a distance of several miles, sent back the dog by himself in the night time, who picked out the individual sheep that had been pointed out to him, separated them from the flock and drove them before him by himself till he overtook his master, to whom he relignoished them took his master, to whom he relinquished them.

These creatures perform such acts on the Scottish

mountains in regard to the guidance and direction of flocks that they are utterly incredible without being seen. and nearly incredible when they are. The waving of a shepherd's arm at a distance far beyond the sound of voice is sufficient to regulate all their movements; and you may see them a mile or two off, on top of the hills, obeying every gesture of their master, pointing out various and complex operations. Mr. Jesse affirms that he saw a colley once in Perthshire taking a flock of sheep to Falkirk Tryst or Fair; and as the read was dusty he chose to indulge his charge occasionally with a bit of green walk and nibble. To accomplish this, where he observed a gap in a hedge he bounded into the field and ran on to the far extremity of the route; if he found an opening there he returned and drove the sheep into the pasture to pick up a little on their way; if not, he occupied the gap and resolutely denied them entrance, driving them, with barking, along the turnpike road.

NEW YORK DOG SHOW, -In addition to the names of NEW YORK 1906 SHOW.—It authors to the nairos of the railroad companies given hast week, letters have been received from the following roads, saying that they will carry dogs free to and from the show when accompanied by their owners; Great Western R. R. of Canada. Wm. owners: Great Western R. R. of Canada, Wm. rry dogs the to and from the show when accompanied y their owners: Great Western R. R. of Canada, Wm. . Edgar, Gen. Pass. Agent. New Jersey Midland R. R., J. C. Anderson, Gen. Pass.

Agent. Wabash, St. Louis and Pacific R. R., H. C. Townsend, Gen. Pass. Agent. Canada Southern R. R.; Frank E. Snow, Gen. Pass,

Agent.

ENTHES FOR THE DEBRY.—New York. March 9th.—
The following entries for the Field Trial Derby of the National American Kennel Club have been received up to
this date: Black and white ticked setter dogs Dashing
Chief (Dash III.-Dora II.), Dashing Jewell (Dash III.Pho-be); liver and white ticked setter dog Dashing Jerry
(Dash III.-Pho-be); black and white ticked setter bloss Dashing Jory
Dick (Dash III.-Dora III.), Doshing Jewell (Dash III.Pho-be); linek and white ticked setter blick (Dash III.Countess II.), Count Tick (Drake-Vesta),
Count Tell (Drake Ada); black and white ticked setter
bitches Countess Ada). All the above entered by
the Harvard Kennel Club of Boston, Mass. Cecile (Morford's Don—Raymond's Fairy), orange and white setter bitch, entered by Mr. Robert Sewell, New York
City; Duke of Austerliz (Guy Mannering-Albey), setter
dog, and Ballyhale (Sance parentage), setter dog; Belliaa
(Sanne parentage), setter bitch, entered by Mr. E. C. La
Montagne, New York City: Lady Caprice (Sane parentage), setter bitch, entered by Chas. De Ronge, Short
Illils, N. Y., Prye and Rock (Dor-Fairy), setter dogs, entered by Mr. Theo. Morford, Newton, N. Y.
CHAS. DE RONGE, See'y N. A. K. C.

**Cockers for Voodcock and Grouse.—Horneleville, N. Y., March 8th.—I have had some experience with dogs for grouse, woodcock, squirrels, etc., and I have learned this fact, that a cocker spaniel is the best. In fact I believe a cooker spaniel to be the best dog for general use there is. They are not too large to keep in the house, are good watch dogs, are faithful and kind to children, and can be taught all kinds of tricks easily. They cannot be best on ruffed grouse and woodcock. They hunt and retrieve naturally, and will run rabbits good (although I never allow mine to do so). I do not think it hurts them to tree squirrels. They do not need from six to twelve inouths training before they are life for anything. A cocker will do good work when six months old. I had one last summer which was not flye inouths und Aug. Ist, when the woodcock general opening and the

first day she had four woodcock killed over her and retrieved them all. She was hunted almost every day through the open season, and had over 150 ruffed grous and woodcock killed over her. John,

FECUNDATION AFTER SPAYING.—Ithaca, N. Y., Feb. 27th.—I have read several articles in your paper in regard to bitches bearing puppies after being spayed, which induces me to tell you of a similar case that occurred here. A gentleman living here had a spaniel bitch spayed when she was seven months old. When she was one year old she had a litter of puppies, but has never been in heat

The above only corroborates what we have already said, which appeared in issue of January 15th, i. e.: "If the ovarics were removed as thoroughly as you say, we very much doubt her ever having a second litter. It must be remembered that the dog's cestrum occurs only about twice a year, and it is possible that her condition at time of spaying was physiologically such as to permit of ovum fecundation. The similar operation upon the opposite sex has often left the power to procreate onceat least it has been so reported." Complete removal of the ovaries will certainly prevent fecundation.

KENNEL NOTES.

Whelped seven pupples, three dogs and four bitches, by Decimal

Oucon-Mr. A. E. Godeffrov's champion pointer Queen whelped

Queen—Mr. A. E. Godeffroy's champion pointer Queen whelped eleven pupples, by Croxteth; all dead but two. Mona—Mr. A. E. Godeffroy's red Jrish setter Moya whelped soven pups, four dogs and three bitches, by Rover II. Datay—Mr. C. H. Thomas' red frish setter bitch Datsy whelped, Feb. 15th, ten pups (eight dogs, two gyps), by Grouse; gyps dis-posed of; rest doing well.

BRED .- Silk-Decimal Dash-Mr. A. E. Godeffroy's blue Belton Silk to Decimal Dash.

Dora-Croateth—Mr. A. E. Godeffroy's pointer bitch Dora to

Croxteth.

Croxten.

Flirt-Captain—Mr. A. E. Godeffroy's cocker bitch Flirt to Mo-Koon's Captain.

Jaunty-Faust—St. Louis Kennel Club's liver and white pointer

Jaunty-Faust—St. Louis Kennel Club's liver and white pointer blieb Jaunty to Faust.

Finny-Victor—Samuel Rissel's beagle blieb Fanny to Pownall & Elmore's Victor, by imported Rattler-Bluebell, Feb. 28th.

Bauty-Victor—George Pownall's beagle bitch Beauty, second prize winner at Philadelphia slow, 1879, to Pownall & Elmore's Victor, by imported Rattler-Bluebell, March 1st, 1880, Christiana, Lancaster County, Pa.

Pet. Don—E. F. Mercilliot's (N. Y.) Pet to Morford's Don; Don

out of champion Grace by P. H. Morris' Lark.

Rambler-Fty.—The imported stud-beagle Rambler, belonging to
the Montchir Hunt, of Montchir, N. J., has just returned from a
visit to Mr. John Whitaker's beaglo-bitch Fly at Philadelphia, Pa.

SALES .- Mr. L. H. Smith, of Stratbroy, Ontario, has just sold Mr. A. H. Moore, of Philadelphia, a brace of bitches, young sisters to Lass O'Gourie, for \$1,200, and they are now probably in Mr. M.'s kennels. It is said no dogs, for beauty, ever left Mr. Smith's ken-

nels which are their equal.

Carlow-Mr. H. C. Beyering, of Warsaw, Wis., bought on March 2d the liver and white cocker spaniel dog Carlow, whelped March 18th, 1879, out of Bess, formerly owned by Mr. W. E. Shedd, Wal-tham, Mass.; by Captain.

NAMES CLAIMED .- Mr. D. P. Bosworth, New York, claims the following names for his cocker spaniel puppies, out of Clare, by Mr. Wm. Goff's Dandy, whelped Dec. 17th, 1879: Dandy II., Clare II., Cricket, Pete, Psyche, Tansy.

Woman's Column.

CANOEING ON THE DERWENTWATER,

DURING a trip through England last spring my hus-

DURING a trip through England last spring my husband and myself visited the lakes about the middle ness, as is usually the case at that season.

Our first stop was at Keswick, on the Derwentwater, a neat little English town, under the shadow of Skiddaw, a mountain of considerable height, although it might not appear of much importance to an American. Southey lived in Keswick a number of years. The lake is almost surrounded by high hills, and has three picturesque islands: one of these was formerly the residence of the Earls of Derwentwater, but is now completely deserted. We found any quantity of various kinds of boats to hire for excursions on the lake. Our choice fell on two Rob Roy canoes. The English ladies are particularly fond of canoeing; it is really astonishing the ease and grace with which some of them handle the double paddle. After an easy pull of three miles we arrived at the end of the lake, which is only three miles long by one wide. We hauled our canoes up on the pebbly beach and walked about a quarter of a mile to the Falls of Lodore, immortalized by Southey's poem, "How Does the Water Come Down at Lodore." Here we crossed a running brook, where we how we have the speckled trout darting about in the shadows. How we did wish for a rod and reel, and that the streams we not all preserved!

How we did wish for a rod and reel, and that the streams were not all preserved!

Continuing down the Borrowdale Valley for two miles and a half we came to the Bowder Stone—an immense rock, thirty-six feet high, sixty-two feet long, weighing two thousand tons. They say it was carried there during the glacial period, but more probably has rolled down from one of the mountains. The valley is rather narrow, walled in on both sides by high cliffs, and considered more beautiful than any other in the lake district.

We took dinner at the Lodore Hotel, then launched our cames, but didn't have such an easy pull back to Keswick, for the wind was blowing hard, and had raised a little sea, that occasionally washed over our boats. We were nearly half an hour trying to weather one point; finally had to give it up and make a carry across the said point.

point.
Eurther on we landed on St. Hubert's Island to gather flowers, for in some places it was nearly covered with primroses, grow ing down almost to the water's edge. My husband brought out a small portable camera, which

he had stowed away in the forward part of his boat, and took a good negative, with the cances in the foreground, the lake, the opposite shore and mountains beyond. We again took to our boats, and after a short paddle we reached our botel in time for tea and hot numfins, which they know how to make in Keswick to perfection.

Archern.

PRIVATE PRACTICE CLUB.

SINCE the publication of the constitution and rules of the Pri-Since the planeaution of the constitution and rules of the Private Practice Club in your issue of Feb. 12th the Secretary has been in receipt of hundreds of letters of inquiry with reference to the purposes of the club, and how membership could be secured To overy one of these he has given a reply, with full particulars. To every one of these he has given a reply, with full particulars, and several archers have attached themselves to the club, and very many more have indicated their intention to join during the next month. The club now has the following membership, divided among the three first classes:

- First class - T. R. Millard, Will. H. Thompson, Maurice Thompson, J. D. Patterson, Tac Hussey, Geo. F. Henry, E. B. Weston, O. W. Kyle, Edwin Devol, Lorenzo Devol, Theo. McMechan. Second class - E. T. Church, W. P. Lacey, C. W. Sherman, P. S. De Graff, C. E. K. Baxler, Frank H. Walworth, L. L. Peddinghaus, C. I. Slack

Third class-E. P. Chester, C. C. Moore, C. G. Hammond, E. F.

Wells, J. B. Devol, Howard Fy,
So short a time has elapsed since the publication of the constitution and the rules that few have had opportunity to Join, and
of those who have become members several have been prevented
by stress of weather from shooting any scores. The state of the by stress of weather from shooting any scores. The state of the weather also accounts for the fact that nearly all the shooting has been at the 60-yard range. The shooting rounds have been set, the winds so boisterous, and the weather so generally had that members have done little at the long ranges. Considering the disadvantages under which the shooting has been done, the the disadvantages under which the shooting has been done, the shooting is a surprisingly good one, the average of the entire scoring in the three classes at 60 yards being within a small frac-tion of 77 points with each 24 arrows. From such a beginning it is safe to predict that during the summer this general average will be raised to 100 points. It will be interesting to note the advance-ment in this general average of all the shooters. The Secretary cannot but repark the or their value of such warmer sentences. cannot but remark the evident value of each member endeavor-ing to shoot the York Round regularly through, beginning with the 100-yard range whenever it is at all practicable to do so. As the scoring is much more easily reported thus, the practice is very much better for the shooter, and certainly more in accord with the spirit of the P. P. C.

the spirit of the P. P. C.

The Secretary begs to say that since it is not clear from the language of the constitution and rules of the club as to whether a York Round is to be made up by the Secretary from a shoater's report, out of detacled scores shot at the different ranges upon different days, when nothing appears to show that such images were consecutively shot, he has construct the meaning to he that each York Round, which is shot as a round consecutively, and reported as a round, shull be recorded as a York Round, which is shot as a round consecutively, and reported as a round, shull be recorded as a York Round, but otherwise, detacted as second as york to wanters which were you otherwise, detached scores at any of the ranges which were short in sequence will not be so reported, but will have phose as of that range only. The York Rounds, which are shot as such, should be reported with the 100-yard range first, from the Selyard range, followed by the 50-yard range. The scores of the York Roundshot by the members from Marietta, Olido, were thus shot and reported, and their example is commended.

The Secretary further requests that each archer who does not The secretary inther requests that case maker win does not shoot a York Round through will endeavor to shoot one of the ranges through—that is, either 72 arrows at 100 yards, 42 arrows at 80 yards, or 24 arrows at 80 yards. The shooting of a fractional number of arrows at my range adds much to the difficulties of number of arrows in any rauge and senden to the dimensions the Secretary in making up the averages of each shooter. In this report some fractional arrows, such as "3 shots at 100 yards have been omitted, though in the final report of the Secretary upon which the prize awards are made, they will be recorded. An other matter is especially pressed upon the attention of members other matter is especially presear upon the attention of members— to see that their scores are correctly reported. In the reports to the Secretary for February, no less than seven Impossibilities occur. Thus one mether reports is Pints, 49 score; another, 31 hits, 41 score; another, 18 hits, 97 score, and other similar mis-takes. Of course, these records cannot be true, as no even num-ber of hits can make an odd number in score, and rice cersa. Now, ber of hits can make an old number in score, and vice versa. Now, since the mistake would be just as likely to occur without inpuering in this impossible form, it is presumable that there are as many more mistakes which the Secretary cannot discover, Archers should certainly be more careful in their reports. Since the Secretary did not wish to record a score in an impossible form, and supposing the mistakes to be small, he has penalized such mistakes by deducting one point from each score so reported, so as to make the bits and score appear consistent. Thus the score 18-67, was corrected to 18-96.

Such a penality is surely not unfair, since it is the error of the archer reporting the score, and since technically such a score

Such a penaity is surely not unfair, since it is the error of the archer reporting the score, and since technically such a score could be disregarded entirely. It is to be hoped that archers will very arefully examine their reports before sending them to the Secretary. It is also urged upon members that they mail their reports to the Secretary at once upon the closing of each month, as it requires much laborat his hands to prepare his monthly reports, and he should receive each archer's report by the 4th of the worth.

Relow are the scores :-CLASS L

NEW YORK ARCHERY CLUB.-Last Saturday evening the return NEW YORK ARCHERY CLUB.—Last Saturday evening the return match between this club and the Ascham Archers, of Brooklyn, E. D., took phose at the Ninth Regiment Armory. In the original match there were four gentlemen and two ladies on cach team, but Saturday evening only one hady contested from each club wing to siskness of one of the Ascham's fair archers. The New York Club had prepared everything in good shape for the reception of their guests from across the river, and after the arrival of the latter, both teams practised a little before commencing the trial of the evening. At 8 o'clock shooting commenced. The bad trial of the evening. At 8 o'clock shooting commenced. The half presented a fine appearune, being filled with a large number of spectators drawn together to witness the first exhibition of the kind in this city. The interest taken and the pleased looks indicated that archery has afternedy taken a good hold upon the peocated that archery has already taken a good hold upon the people, and hereafter we may see at a flating of this kind much larger numbers. It is something for the New York Archery Club to be proud of, to be able to say they were the first club to introduce this royal sport to the public of the City of New York. The Ascham Archers having lost the first match, naturally perhaps felt as though they would like to win the second, thus causing the third one necessary. But the New York boys (and girls) did their best to retain their prestige, which they accomplished in good form. Although better scores were made by all of those contesting after the match was over, still the record below shows a great improvement on the part of both clubs since their last match.

After the match sides were chosen, including archer guests from the Brooklyn Club, and the sport indulged in until H

The New York Club meets every Saturday evening at the Ninth Regiment Armory, where they are pleased to see visitors.
The following are the scores of each team:

ARCHERY SCORING.

NEW YORK, Feb. 9th. Editor Forest and Stream :-

Editor Forest and Stream:— NEW YORK, Ftb. 0th.

The discussion of archery scoring has now advanced so far that a change is probable in the near future. That it is a question of videspread interest is proved by the communications from the East, from Hilmois and from far-off California. After Mr. Hownell's opening article the writer stated the negative arguments in turn, for the purpose of bringing it too unisue, and provoking discussion. Mr. Brownell has ably stated the numerical arguments in favor of a change. Mr. "Pacific Poor-Shot"—Poor" is doubted—has added a few spicy remarks upon the same side, and "T. R. W." has contributed a novel method of corrections to partially obliterate "chance" at the longer ranges.

All this is excellent, but why stop at a change in numbering? Why not make a thorough alterntion of colors, as well as number? Gold, red, blue, black and white is a marter of toxopullity.

sentiment and tradition, as well as 9, 7, 5, 3.1. If we are to change our scoring for a better and fairer method, why farget colors as well, and adopt the best combination without re-ference to sentiment or tradition?

All archers who use the longer ranges know that beyond sixty

or seventy yards the apparent diameter of the larget is so re

or seventy yards the apparent diameter of the furget is so reduced as to practically prevent aiming distinctly at the gold. The aim is at the target as a whole, because the colors are so blended and reduced by distance that the aim must be at the target, and not at any small portion. At eighty yards, to aim at the gold and to aim at the target are, in ordinary dnylight, synenymous, while by gaslight the same effect results at a nearer distance.

Now, if, instead of the gold with its concentric colored circles, we should face our targets with white canvas having a central spot of black ten inches or a foot in diameter, and the remaining space divided into four rings of equal width by narrow concentric lines of black, should we not have a mark which, at any distance, would offer one well-idefined, prominent center for our tim? And such a target, numbered from 5 to 1, would be available for all times and places, and to a large degree destroy the undue value of chance hits.

S.S.R.

OHIO STATE ARGHERY ASSOCIATION.—The Executive Commit-tee, and the delegates of the various archery clubs throughout the State of Ohio, will convene at the Gibson House, Cincinnati, the State of Onio, will converse at the Gibson House, Chacimatt, Ohio, on the 17th of March, for the election of new officers, etc., and selecting a place for the belding of the second Grand Annual State Tournament. Club throughout the State that no not yet members of the Ohio State Archery Association should make application at once to the Corresponding Secretary, Mr. Chas. Welker, Cincinnati, Ohio.

COLUMBIA COLLEGE CRICKET CLUB.

It is very gratifying to state that the Columbia College Cricket It is yory grating to state and the common conteg or the formation to the common conteg of the first wall be largely in creased this coning season, and a genuine spirit and interest will be aroused content spirit and interest will be aroused to the contege thereby. We may say that the past season was as successful as could be expected under the therefore the content of the conte the crowledge of the control of the has been due entirely to his perseverance. He is an excellent captain and he possesses a full knowledge of the game. The club was organized last spring after the first match, on May 3lst, versus an amalgamated first and second cloven of the Staten Island; it was then that Mr. Hyde-Clarke was elected President and Captain; Mr. J. P. Conover, late from St. Paul's School at Conord, N. H., Vice-President; Mr. W. F. Morgan, Scoretary-Treasurer. Out of the whole college just eleven men took up the game, of which four had never played cricket before, and most of the oftens but very little in fact the only three that had played regularly were Mesers. Hyde-Clarke, Conover and Egan. Besides these there were the two Morgans, De Forest and Emmet, who had played at school; and the rest of the cleven, Horcick, Barnes, Torrey and Weaver, who had never played. The regular bowlers were the three first-amend, while Morgan, Sr., Barnes and Weaver were tree first-amend, while Morgan, Sr., Barnes and Weaver were tree did different times. In the batting averages Hyde-Clarke came first, followed closely by Egan, both securing double figures. Conover did not play up to his standard, while the two Morgans and De Forest showed the next best batting form. The fielding was generally fair at all times, Conover and Torrey especially distinguishing themselves in this line. Herrick made runs in Thiiadelphia in the Pennsylvania University match, as did also Barnes; but the style was essentially base-ballish. All bands showed their intention of becoming cricketers by predicing regularly. The short season in the autumn being particularly encouraging, the old team not only turned up again, but muny new hands taking hold; and we expect there will be no little competition for places on the team this spring.

The one inter-college match was the one alluded to above with the University of Pennsylvania, the Philadelphians winning by Si runs. For Columbia College Hyde-Clarke secured is and 10; Egan, 15 and 14; Herrick, 6 and 10, and Barnes, 1 and 15 an

the college boys will do no harm to the turf which was originally aid out for the use of the cricketers of New York City, it is expected that the St. George's Club will share their ground at Hobokon, N. J., with Columbia College this season.

PUBLISHERS' DEPARTMENT.

ROCHESTER STILL AHEAD—A FIRST PRIZE TAKEN AT THE WORLD'S FAIR BY A ROCHESTER FIRM—The World's Fair of 1879 was held at Sydney, New South Wales, the principal city of Australia. Exhibits were there from all parts of the world, including those from the largest and pest known cigarette and tobacco manufacturers. Notwithstanding the many varieties of German, Russian, Prench, English and American cigarettes and tobaccoo on exhibition, the display of cigarettes, Vanity Fair tohacco, to., made by W. S. Kimball & Co., of this city, was awarded the first prize by the commissioners. A callegram from Sydney yesterday amnounced this fact. This is a triumph for Rochester and its manufacturing induspries. Six first prizes have heretofore been woon by Kimball & Co., at great exhibitions, this making the seventh.—Rochester Democrat and Chronicle.—[Adv.]

An Excellent Ourrit.—The Boston shooting suits advertised by G. W. Simmons & Co., have been in use for rears all over the country, and have received the unanimous indorsement of portsinen. The man who invests a them will be regaid ten times over in comfort.

BETTER TIMES.—The business revival and new era of cosperity which is now fairly inaugurated, is in keeping with the increased health and happiness seen all over the and, and is one of the results obtained from the introluction of Warner's Safe Kidney and Liver Cure. "The hanges wrought by this remedy," says Rev. Dr. Hayvey, seem but little less than miraculous,"—[Ada.

Answers to Correspondents.

Correspondents who may send us their proper name and address will always receive prompt attention in these columns. We require a man's name for two reasons: (1) sometimes as a guarantee of good faith, and (2) always as a matter of common courtesu. As a rule we do not reply to inquiries by mail, except in cases demanding immediate advice.

J. M. C., New York.-See another answer.

F. W .- Have written to the Treasury Department for the information desired

St. EARNS, Dansville, N. Y.—The Baltimore Bench Show was held in 1878, April 23d to 24th. J. F., New York.-We should advise you to take a Winchester

rifle for grizzly bear shooting.

J. S. G., Union Church, Miss.-We shall be pleased to publish our club scores. There is no charge.

R. S., Vernon, N. J.-Quail can be bought of Messrs. Whitley & Iorris, 218 Washington street, New York.

E. W. M., Philadelphia, Pa.—The choice between the guns is a matter of taste, as is also the style of action. J. W. Faicchild, Wis .- There is no book specially prepared for a

ie-score book. You may uso an ordinary blank

F. M. W.—To preserve tents from mildow apply the recipe published in the "Cabin Locker" of our yachting columns, issue Feb. 25th. To apply paraffin, melt it and apply while hot. J. M. D., Jr., Yale College, New Haven.—Good duck shooting near New York may be found on Long Island. See the reports in

our game columns. FORESIGHT.—You may find grouse and quall shooting in Maine in the fall. Go in September or October. The season extends

from Sept. 1st to Dec. 1st. P. S. W., Clarion. Pa.-1. For Coues' book see our Natural His

tory column. 2. Tell us where you want to go duck shooting and re may help you. C. D. L., Swedesboro, N. J .- The trout fry advertised by Thomp-

son Bros., of Aquetong Ponds, New Hope, Pa., will do well in your ponds, and we should advise you to try them. Bob White, Oumba, Neb.-You are mistaken about our prize.

We did not make such proposition, but we shall be glad to hear from you nevertheless.

T. D. McA., Middletown, O.-Conlin of this city publishes his own targets, and you may procure them directly of hit to James S. Conlin, Bifle Gallery, Broadway, New York.

A. S. H., Van Ettenville, N. Y.—You will find instructions in fishing and hunting in Hailock's "Sportsman's Gazetteer." For small game also consult Bogurdus' "Field, Cover and Trap Shooting.

F, B, J., Platesburg, N.Y.—I. We cannot tell from the pattern whether your gun is full-choked or not, 2. You can safely use the 5-dras, powder, 150z. shot, but you will find it probably too much for your shoulder.

B. L. F., Boston.-We know nothing of any such gun manufac thred in America. By writing to the advertisers of this style of gun you will receive circulars setting forth what is claimed for it. We shall shortly discuss the subject.

St. Ealars, Rochester, N. Y.—In what class in the coming show should I enter my white and black ticked setter bitch Pearl, by Whitman's Grouse, out of Valentine's Neilie? Ans. Native Eng-lish Class.

C. C. B., Washington, C. H., Ohio.—Will you give me in brief the characteristics of the Belton strain of setters? I have one by imported Belton, said to be out of imported Rose. Ans. See FOREST AND STREAM, Feb. 14th, 1878, and Feb. 5th, 1880.

F, Biftimore.—Please inform me whether there is any work which treats of sport with rod and gun in California. Ans. None that we know of. The files of the Forest AND STREAM contain articles concerning aimost every kind of California sport.

B. W. B., New York City .- The address of man asked for, the trainer, is Drownville, R. I. His charge for breaking is \$12 per month, with the understanding that he is to have dog one

KINGS COUNTY.—We publish the article elsewhere, and should have rendered unto Casar the thing which belongs to Casar did it bear his superscription. You will greatly oblige by sending us the omitted address.

G. B. M., Radeigh, N. C.—The Winchester, 73, is as accurate as any gun carrying the same charge of powder and lead. There can be no question as to its accuracy at 250 yards. The price of gun asked in round barrel is \$31; in octagon barrel, \$37; both models, '76, 45-60.

A. S. S., Philadelphia, Pa. - You may find the picture, "A Friendly Service," by consulting some of the dealers in pictures and prints. We have no means of ascertaining its author. The cut in the Forest and Stheam was reproduced from an engraving in a French sporting paper.

J. W. M. and C. H. J., Boston, Mass.—I. We know nothing of the revolver. 2. You will not find any shooting in Nova Scotla in July and August. Later you may have moose, caribou, part-ridge, woodcock, snipe and teal shooting. Non-residents are required to take out alicense fee, \$20,

R. M. L., Torresdale, Pa. -Write to Dr. Gordon Stables, Twy-It. M. L., Fortesone, Fa. "Artis to Dr. Corono states, ray-ford, Borks, England; lie can procure the dog you wish at a rea-sonable price. Dr. Stubles will visit this country in the early summer and intends bringing over a number of selected dogs of

C. W., Minnesota Junction.-We know nothing of the book you C. W., Minnesota Junction,—We know nothing of the book you inquire for. If you wish instructions in shooting, buy Bogardus, "Field, Cover and Trap Shooting." The firms whose names you will find in our advertising columns, publish catalogues of their goods. By sending for these and consulting them, you will find a choice of Brearms.

R. M. B., Philadelphia, Pa.-1, For 12-caliber, 81 lbs, gun, use 16. M. D., Prinacelpinis, Pa.—1. For 13-calloer, 81 108, guin, use 2 to 34drs, of powdor, Jlozs, shot. The ordinary powder you will flad satisfactory. 2. If your guin is choke-bored, it will have stamped on the barrels "Not for ball." 3. If a cylinder-bore, you may sately have it converted into a choke-bore. Squires, No. 2 Cortlands street, will do it. Cost, \$2.30 per barrel.

PIONEER, Alpena,-It is true that the pressure of water in a vat depends only upon the height of the column, and not upon the mass. The pressure upon the sides of two vats 9 feet high, one 3 feet diameter, and the other 9 feet diameter, is allke; but the

vat of smallar diameter is a much stronger structure, so the one ire stronger booning, or internal of larger diameter will rec bracing.

ROYAL, Belvidero, Ill -I have owned and seen many revolvers MOYAL Belvider, III.—I have owned and seen many revolvers that will not revolve, on account of the sartridge expanding backward against the frame of the revolver. Have experimented and cannot determine the cause of the trouble. Ans. Good makes of revolvers do not give this trouble. You must have purchased an inferior weapon. It is impossible to explain the trouble without seeing the arms.

without seeing the arms.

C. M. B., Bedford, N. Y.—My Newfoundland pup, six months old, occasionally steals eggs. Will you tell me the best way to cure him of such a bad habit? He is whipped every time he does it—every time he at least that he is found out—but still once in a while he will do it. Ans. If you punish him severely it ought to remedy the trouble. Be sure that the dop knows what ho is whipped for. Sometimes an egg partly blown and then dilled with red pepper will destroy the egg appetite.

A. B. S. M. Blosse eight state of the with read the state of the with red pepper will destroy the egg appetite.

red pepper will destroy the egg appetite.

A. B. S., Md.—Please give me advice as to my beagle puppy eight months old. He has been running a great deal lately of nights, and is quite sick. He seems to have a kind of stiffness all over. Whenever he is touched he seems in pain. He refuses all food. Ans. Doubtless your dog is suffering from rheumatism. Warm, dry bed, no meat except boiled liver for a week or two, and twenty grains of blearbonate of soda three times a day, dissolved in a little water; also give a dose of castor oil.

(I. F. W. New York, Most twyldpunists wash thou specimons.

O. E. W., New York.—Most taxidormists wash their specimens with cold water, and then, having smoothed them with a dry cloth so as to remove as much of the moisture as possible, lay in dry plaster of paris, and dust it through the feathers. The washing should be done after the skin has been taken off. and grease stains on old prepared skins can sometimes be removed by adding a little soda or spirits of hartshorn to the water, but it is always a difficult matter to cleanse skins that are thoroughly dry.

dry.

H. B. Hope, Toronto, Canada.—Can you inform me if the copper or copperhead snake is very venomous and plenty in Michigan, on the border of the St. Clair, or is it only a buye-hear of the natives, as was the case anent, rathesnakes on the islands of Niagara River (Navy Island)? I shot there two Julys and found a few woodcock and one thousand wood-tick, but no rattle snakes. Ans. We have no knowledge on the subject, but presume the snake is not abundant there. Perhaps some of our renders can inform you. inform you.

inform you.

W. B., Philadclphla,—You might add to your collection "The Dog," by Idstone; "The Sotler," by Edward Laverack; "Youatt on the Dog;" "The Dog," by Disks, Mayhow and Hutchinson. For a book on dog handling we have never yet seen anything as good as Hutchinson's "Dog Breaking," Messes, Cassel, Petter, Galvin & Co., 506 Broadway, this city, are publishing a most complete and excellent serial termed "The Illustrated Book of the Dog," by Vero Shaw; it should be in the library of every sports-

TRAP, Princeton, N.J.—In a pigeon match from H. and T. traps, placed say fifteen yards apart (the shooter not to know which trap is to be pulled). A goes to the score. By inadvertence of the puller both traps are pulled simultaneously. A fires and kills with first barrel, in bounds; with second barrel kills the other bird, but out of to bounds. Now the trap which was to have been pulled was say H. trao, whereas the bird killed in bounds came out of T. trap. The referee decided it a missed, or dead out of bounds bird for A. Do you think he was right? Ans. No. A should be given one dead bird.

should be given one dead bird.

G. C. S., Middletown, Ira. —To make bird lime: Boil-lown linseed oil of the best quality until if becomes thick and glutinous. Boil in cartben pot, in open air, for two or three hours, and be sure that the cover of the pot fits tightly, so that the oil will not cartch fire. When bolled, ast away in the vessels with tight-litting covers. To use it: Select small, day sticks, as thick as a staw and eight inches long. Sharpen the edges smear them with the lime, and fasten the sitcks into groove cut in a stake stuck into the ground. Place a "eall bird" as a lure. When the birds alight upon the sticks thoy pull them out from the main stake, and when flying, the wings, coming in contact with the lime, are pinloned to the sides. sides.

J. M., New Haven, Conn.-I have a valuable pointer, two years J. M., New Haven, Conn.—I have a valuable pointer, two years old. Although his nose is cold and mois, his cycs and nose run a kind of mucus, and he has a cough, no appetite, and what he does cut, throws off again, and is losing flesh. If he had the distemper when nine months oll—had it slightly. His general appearance looks as if it was another attack of distemper; still I cannot say that it is. He has been hunted six days a week in the South for the last two months. Sickness may be caused from overwork. What stall I do? Ans. It is probably an attack of the epizonic disease, Feed no meat except bolled liver. Give two grains of value for the times a day, and a little stubur three times a week. uinine three times a day, and a little sulphur three times à week.

C. W. E., Boston, Mass.—The pedigree of the pointer bitch Belle, owned by Mr. George C. Colborn, of this city, is as follows: Belle was whelped June 22d, 1870, on shipboard; is of medium size, and was whelped June 234, 1870, on shipboard; is of medium size, and ine oo rlenon and white. Her sire, Rollo, also lenon and white, was sold, and went to India; he was said to be first class in the field. Her dam, Belle, No. 1,013, E. K. B. B., was whelped 1863, bred by Mr. Wisem, and sold to Mr. F. R. Bevun, Western Grove, Southampton, Eng., who in turns sold her to Mr. Ross, who brought here to this country. In color she was liver and white. Both sire and dam are of the Lang strain, and also include the strains of Mr. Edge and Lord Derly. Mr. Edge and Lord Derby.

ar, Bige and Lord Derby,

O. T. S., St. John, N. B.—1. The firm we have investigated and find to be fraudulent. 2. The recipe for terrupin stew is as follows—it is furnished by Monquin, the famous enterer of Fulton street, this city: After the terrapin has been bled, put finto beiling water for ten minutes. Then take off the shell and cut up into small pieces, being careful not to break the gall bladder. Stew in a little butter, adding a bouquet of carrot, leeks, bayleaf, one onion with cloves, and a hadle of broth; glass of Madeira wine. Let the whole stew slowly on covered range. Before serring, add a sliced Iemon and a hard-boiled egg cut into small pieces. pieces.

CONSTANT READER, Brooklyn, N. Y .- A friend of mine and my-Conseant Reader, Brooklyn, N. Y.-A friend of mine and myself think of starting on broschark and riding from New York to Colchester, Conn. As we might stay out over night I should like you to say what we had best take. Of course, we want to make it as light for the horses as possible. We each have rides; should we earry them? Should we earry thy-rods? Where can I get a book which will give mo the principal roads from New York to Colchester, or from New York to New Haven? Ans. Go to a hole of farmhouse at night. You will want a good civilized bed after fiding all day. Leave the ridies home; the traups won't trouble you, and Sitting Bull is not on the war-publ. The figrods, however, may come into good service. For map of country try the Coltons, William street, New York. try the Coltons', William street, New York.

NEW YORK, THURSDAY, MARCH 11, 1880.

To Correspondents.

All communications whatever, intended for publication, must be

All communications whatever, intended for publication, must be secompanied with real name of the writer as a guaranty of good faith and be addressed to FOREST AND STREAM PUBLISHING CONTACT. Among the published if objection be made. Anonymous the published of the published of the published of the contact promise to return rejected manuscripts. Secrements of Clubs and Associations are urged to favor us with brief notes of their movements and transactions. Nothing will be admitted to say department of the paper that may not be read with propriety in the home circle. We cannot be responsible for dereleitor of maliservice if money remitted to us is lost proposed by the propriety in the come circle.

Notes.—By request of Prof. Baird, Mr. Walter Brackett, of Boston, will send his famous salmon pictures for exhibition at Berlin.

At the meeting of the New York Association for the Protection of Fish and Game, last Monday evening, it was decided to have one good bill drawn up by the Association and its enactment at Albany attempted. In this way the game legislation will be taken out of the hands of incompetent or interested parties. The bill will be prepared at once and published in the newspapers, so that the public may have an opportunity of judging for themselves of its merits.

The Adirondacks are popularly supposed to have been fished out. Many a summer visitor to the NorthWoods has been disgusted by the scarcity of trout and the obtrusiveness of the tin can and the paper collar—two of the modern traces of semi-civilization. Yet there are regions where one may find abundance of game and fish. of these localities are designated on our first page to-day.

Duck shooting is fairly inaugurated in the Eastern and Middle States. Excellent reports come to us of the flights of birds. We invite our friends who have success with the ducks to send us early reports of the same. We should also be pleased to hear of the game prospects of the country.

"Wallace's Guide to the Adirondacks" is the standard. Intending visitors to those regions should provide themselves with it. We furnish the book. Price \$1.50,

The Herald Irish Relief Fund is developing some curious phases of charity. Next Saturday evening, at a hall in this city, the exponents of the manly art are to give a benefit in the good cause, when "Dangerous Jack," Paddy Ryan, Pete McCoy, and others, will punch each other's heads in aid of old Ireland.

PERSONAL,-Mr. John Harvey, of the Harvey Shipbuilding Co., Wivenhoe, England, left for home by the Parthia yesterday. Mr. Harvey, during his stay in America, won many friends by his affability and genial disposition, and his views upon yacht design we found as broad and liberal as they were intelligent. We had the pleasure of examining a fine lot of models he brought with him, including those of that peerless trio, Seabelle, Miranda and Julianar, concerning which a book might be written. The models and plans drew forth praise from all who were fortunate enough to obtain a view of them

THE MUTUAL INTERESTS OF FARMERS AND SPORTSMEN.

THE right side of the much-vexed question of game protection certainly and always is the due protection of game at all times, both when the law forbids taking game and when it allows it to be taken. The right side also includes the use of none but fair means of taking game and in fair quantities.

The article in a recent number relating to the game of Long Island and its former abundance and variety, and the present deplorable scarcity, with some of the causes which have led to it, and the best means of renewing, or at least of augmenting the supply to a reasonable quantity as much as present circumstances and careful management may secure, was a very attractive, luminous and readable sketch. Yet it suggests two points which may be urged courteously and amicably in a few words, as in fact the writer of that article may himself have it in his own mind to suggest in a future article. These suggestions, too, are by no means confined to Long Island, but are equally applicable to the whole Union. They are: 1. The means of protecting feathered game by the aid of the farmers. 2. The limit of slaughter which sportsmen themselves will set to their own pleasure.

Now, first, the means of protecting feathered game particularly young birds, till they are of proper strength and size to have a fair chance for life, or a fair share of them to renew and perpetuate their race, is a most vital point. Omitting at present the discussion and even the mention of all other means, there is one precaution and protection which of itself alone would suffice abundantly to enforce thoroughly all the game laws, and in fact go far beyond the scope of the laws-namely, such a uniform system and policy on the part of all sportsmen as will give all the land-owners a warm and steady interest in raising and sheltering and defending all the broods of young birds on their farms. If all the farmers on the Island were one and warmly one in this matter the work would be done up thoroughly, for they are lords of the land.

In very many instances, as matters now stand, farmers and gunners are not friends in these matters, and have no interest to befriend each other. Without going closely into particulars-which in fact is not necessary-the fact is that there are gunners who are brutes and wild beasts when their gunning-fever is at the height, and who, like so many Malays running a-muck, will recklessly trample down crops in a ten-mile walk, damage and exasperate the farmers all the way; perhaps if accosted, and that in a proper way, insulting or damning the farmer, or to the disquiet or alarm of his wife and daughters shooting into his doves, possibly while the doves are near the house or on the home lot or on the barn roof. Such gunners come out from the cities every year and are a disgrace, and worse yet, a great injury to all the real gentlemen who like now and then to handle a gun in the right way and time. One is an offender, and the next ten are blamed and hated on account of this one.

Let all the farmers and their sons and hired men find it pays them to protect birds and they will do it and satisfy all parties. The gunners are willing to pay for their sport more than the pittance of ten cents a quail, which a sly and stingy baggage-master hands out secretly to the trapper. The dime is a bigger coin to the hardhanded farmer's boy, scanted of spending-money, than a quarter is to many a sportsman. Let all parties under-stand each other and the birds will be left undisturbed, and will be carefully protected till the honorable gunners come at the appointed time and pay for the sport that is then and thus guaranteed them on good grounds, something as in the eld country, but in the right way for American citizens. The practical details ought not to be at all difficult to arrange in most parts of the Island, nor in other sections of the country. But if some farmers are dogs in the manger—do not shoot nor let others shoot their farms-all the better, for there will be safe harbors, secure game preserves, where the birds will come up to full strength, and from which they will take wing. to be shot elsewhere or to procreate another generation.

Secondly, the limit of slaughter. It is an axiom which nobody can deny that there must and will be some limit to the number of birds that any decent and provident sportsman will kill under the greatest temptation, for the more birds there are killed one season, of most varieties of cept sea fowl, the fewer will be left to breed and replenish the stock for the next season. "A mass of putrefaction," says the writer to whom we have referred-the splendid woodcock ruthlessly butchered to satisfy the killing mania, not to be eaten by the gunners, not to be given to friends, not even to be sent to invalids in hospitals if nothing better occurred, not even to be sorry for, least of all to be left to increase and multiply an ample quantity of birds for the same or other gunners in future. Of course the writer meant to explain it with a good reason, but failed to explain, and there it stands, sickening, "a mass of putrefaction." No wonder the farmers dislike, despise, abhor and oppose such a waste and greedy butchery

The remedy ought to be no very difficult matter, namely, by establishing among sportagen a public opinion to restrain wholesale killing of game and killing of all pros pects of future game therewith, and it is to the encouragement of such a sentiment that the Forest and Stream is lending its influence. It ought to be settled that no true sportsman will kill merely and solely to kill; that such a spirit is cold-blooded cruelty, which has not the excuse of the hot-blooded criminal, for he often repents bitterly and does works meet for repentance. If the guinner would always pay for the birds he shoots, and if he shoots only what can be properly used, the farmers of the Island and the State and the Union, in a vast majority of cases, would welcome such gentlemanly gunners, and perhaps be proud to rank among them as warm friends of fair and lawful sport.

These two points, upon which we cannot too strongly vital interest to many thousands of men, whose interests in the matter are really identical in the long run, if only regarded in the proper light. But if the farmers are expected to protect and support and favor quail and meadow larks, in order to let mischievous or butchering gunners kill ninety-five out of every hundred, without thanks or pay, perhaps with serious damage to crops, temper and comfort, the sport is rather too onesided. Rather let mutual arrangements be made to equalize it and to harmonize it all around.

THE INTERNATIONAL FISHERY EXHI-BITION.

*HE exhibition which opens in Berlin on the 20th of next month is not one which will attract crowds of people from all parts of the world to revel in sight-seeing and other holiday indulgencies, but its importance, from a commercial, scientific and fish cultural point of view, will prove to be far beyond what those who are not familiar with our fisheries would imagine it to be capable of. At this gathering of the fishery products of all nations we have much to show the people of other countries in the way of preserving fish-food in all its forms of dried, salted, canned, smoked, put up in spices, in oil, refriger-ated, caviare, "extract of fish," prepared baits, etc., as well as much to learn. The same can be said of improvements in modes of capture both by the commercial fishermen and by anglers; our display of rods and fine tackle will probably be unexcelled, while in the matter of methods and apparatus used in fish culture it is only necessary to say that nothing is lacking in this department, from which other countries have long borrowed

The exhibition will be the means of comparing our products with those of other countries, of introducing such of them as prove to be better or cheaper than others, and of bringing those which may be inferior up to a higher standard. As the American exhibit is to be made under the direction of Professor S. F. Baird, it is certain that it will be more full and creditable to the country than could be made by any one not having the resources at his command. We know that Professor Baird, having the fishery statistics for the census of 1880 upon his hands, and the building of the fish-hatching steamer Fish Hawk. in addition to his duties as Secretary of the Smithsonian Institution, and Fish Commissioner, was not at all anxious to make a display at Berlin; but the persistent requests of the German Fishery Association through our Minister at Berlin, Mr. White, finally moved Congress to action, when, as a matter of course, the arrangements were placed in the hands of Professor Baird, who, notwith-standing the limited time which intervened between the passage of the bill making the necessary appropriation for this purpose, and the date of the opening of the exhibition, has, by the aid of his corps of trained assistants, gathered all that was not already in the Smithsonian collection, and will have a display which few countries outside of Germany can equal.

The enormous strides which have been made in these directions by our country within the past fifteen years may be partly realized by the fact that at the International Fishery Exhibition held at Bergen, Norway, in 1865, the United States was represented by barely one exhibit. Then fish culture was an experiment here, and few preparations of fish were in the market, except salted mackerel and dried cod, while now we could not enumerate them all within the limits of this column, not to mention the display which will be made of netting, boats and all the implements in use. Mr. E. G. Blackford, of Fulton Market, and one of the Fish Commissioners of the State of New York, will send over fish in ice, consisting of shad, salmon, trout, bass, red-snappers and such other fish as may be in the market, as well as a few of the famed Michigan grayling, which will be sent him for this purpose by that well-known grayling angler, Mr. D. H. Fitzhugh, Jr., of Bay City, Mich. These, with samples of fish-guano, fish-oil, plaster casts of our principal food-fishes, charts of fisheries, models of hatcheries and canneries, models of the National carp-ponds at Washington, and of the different fish-ways will make a most extensive, and nearly exhaustive exposition of our fishery and fish cultural resources, while the persons selected to go over in charge of them will be instructed to make a full report of all exhibits and awards, thus affording these who do not see the Exhibition an opportunity to

know the extent and comparative value of the displays made by all exhibitors. All goods are to be sent not later than the 18th inst., either to the Smithsonian Institution, or to Mr. E. G. Blackford, 80 Fulton Market, New York, marked : "For the Fishery Exhibition at Berlin. The persons to whom the matter has been intrusted are intending to sail in the North German Lloyd steamer Neckar, from the Bremen Pier, Hoboken, on the 20th, and it is necessary that they should have a complete catalogue of all exhibits to leave in the hands of the printer on the day of sailing, so that it may follow in the next ship.

There will be no attempt at a display of live fishes on the part of the United States Commission, but working models of fish-ways may be put in running order with a few salmon fry to illustrate their practical working, and also some hatching jars. For the latter we learn that Mr. James Annin, Jr., of Caledonia, N. Y., will send over some trout eggs, which, after the Exhibition is over, will be presented to the Deutsche Fischerei Verein. It is also announced that the New York State Fish Commission will make a display of fish which have been reared in their ponds, and also of implements. This will be the only State exhibit, made as such, although the Commissioners of some other States will make individual ex-

Accounts have been published to the effect that all the exhibits were to be transported across in the Fish Hawk but this is not correct; her services are needed here this spring in shad hatching, and the North German Lloyds, with their usual liberality, have offered to transport all articles free of charge,

THE INTERNATIONAL RIFLE MATCH.

HE question of how best to revive long-range shooting at Creedmoor is now a live one before the Board of Directors of the National Rifle Association. Last year at Creedmoor the long-range practice took a season's vacation, and compared with other classes of shooting was a nonentity. This condition of affairs is a disgrace to the association, and it is the duty of its officers to consider the cause of the deficiency and to so order and arrange the programmes of matches that the long-range men may find a foot-hold and be given a fit opportunity for their special style of shooting. It is true, as Col. Bodine said in urging upon the Board at its last meeting, that something should be done for the encouragement of longrange marksmanship, that while off-hand shooting is popular and military shooting very essential, that longrange work remains the perfection of rifle shooting. The drift of military shooting is toward this higher, or longer plane of marksmanship, and in the past it is by and from about on the ground or twisted themselves up in knots and fired over long stretches of country, that hundreds of points were cleared up and the supremacy of Ameriican armories maintained. It is, in fact, the short-range men who are the fancy shooters, if any style is to be dub-While every class of shooting has hed with that epithet. its uses, and to lop it off is to make the sport and the art warped and misshapen, Creedmoor to-day should boast its strong squad of long-range men, as it can muster its thousands of military marksmen, and its long lines of short and mid-range shooters; but how to bring this about is the problem which the Board have now to solve.

The answer may be found in a consideration of the history of long-range shooting in this country. He must indeed be a shooter of vesterday who cannot recite the whole of America's proud record with the rifle before the butts. Mistakes have been made, and it is due to one of these that we are suffering under the stagnation and lethargy of to-day. Such indeed is the judgment of who have had the best of opportunities to inform many themselves, and whose interest is in the answer by reason of their participation in great matches of the past.

It will be remembered that in 1874 we were favored by a visit from the Irish Team, who formed the match because in their winning of the Elcho Shield they had placed themselves as the leading rifle shooting nation of the world. Their visit and the match which they fought with so much eclat with the American Team were very informal. No championship emblem had been established, and the chief results of the contest were to make the riflemen of two great countries better acquainted with each other, to make the Americans confident in their own power and ability, before that time entirely untried, and it set what may be styled the rifle "boom" in this country going. Other ranges were then started, the inefficiency of the militia was commented on, and measures taken to make it a serviceable force, Irish-American match did incalculable good, and American riflemen can never sufficiently thank their brothers from Dublin and Belfast who came over to be defeated for the glory of rifle shooting in America. Then came the return match to settle the very close shade of difference which existed between the merits of the two teams. It was pretty conclusively settled at Dollymount in 1875, and while the frishmen were again defeated, the feeling

ened by the interchange of visits. Thus far it had been a sort of amateur shooting scheme ; championship was not spoken of, and each match was only a friendly contest, with a proud feeling and patriotism thrown in to give purpose and incentive to the efforts of the men.

It was felt that something should be done to systema tize this international long-range work. The Elcho-Shield contest in England furnished the model, and a match excellent in its several details was drawn up, with the Palma as the hauble which was to be the estensible object of the struggle of the team-men, but there crept into the conditions of the match an element of discord in defining the eligibility of contestants, which has been a bone of contention ever since, and it is this which in the opinion of riflemen on both sides the Atlantic is to-day acting as a drag on the progress of international shooting. mistake lay in conving too closely the conditions of the Elcho match, and in place of recognizing the meaning of the word "International," going a step further, and in one marked instance making special concessions in favor of parts of a nation. At the time it would have seemed discourteous to have disbarred teams of Irish riflemen from the contests for the new Centennial trophy which we were launching out with so much enthusiasm. The mistake was made on the side of over-kindness, while there was a good mixture of ignorance, and failure to foresee the almost certain complication which would arise. There was a lamentable blindness to the readiness with which a company of Britishers could raise objections to almost any scheme, and attentive readers of the Forest and Stream since 1876 well know the arguments pro and con on the question of the Palma condition.

Looked at calmly and deliberately it must be acknowledged that the admission of Scotland, Ireland, Australia and Canada as nations, while Great Britain was to be regarded only as another nation, is a trifle contradictory. It is an assertion, in spirit, that the part is equal to the whole. Objection was raised by the English marksmen that if the Palma was to be regarded as an international trophy, then a British team only should be recognized, and that Ireland and Scotland should bear their part in the contest only as component parts of the British Team.

This reasoning was cogent, but the Irish riflemen had been our friends, the Canadians were our neighbors, the chance of defeating the crack Scots was a tempting one, and so the conditions were kept in that curious contradictory condition which in 1876 lead to an international match, with two nations represented and five teams on the field. The year following the match became really an international one. We had a bona fide British team here, who came under protest, claiming, consistently with their position taken from the start and never varied from, that the conditions of the match were wrong and unfair alike to America and her wished-for rivals. A defeat of an Irish team would be only a partial victory. for Great Britain would not be beaten, and no national conquest would be made; and when so elegant a trophy had been prepared, it seemed a piece of criminal blunder ing to demean it by reducing it far below its importance as an emblem of national victory by making sections of a composite commonwealth possible contestants. We may have Irish-American matches, and we may have Scottish-American contests, while our friends, the Canadian riflemen, might make frequent visits to our ranges for their own improvement; but when it comes to an international match we recognize no States on this side the ocean, and we should recognize no countries on the other.

We discuss this question as though it were purely a match between the countries of Great Britain and the United States. This is only owing to the accident that the other nations of Europe persist in the foolish course of entirely over looking long-range practice. In time they may see their folly, and then will come the time of their protest, for it is not likely that they will have the easy complacency of our American Association and be willing to shoot in an international match where five teams may represent one nation.

But it will be said by some advocate of the present bungle that Scotland and Ireland have by their coming, and by their recognition on this side the water, established some claim to the trophy-at any rate a right to entry in future matches. This is a claim without much foundation. Were it a challenge trophy, to be taken after so many winnings, then the claim would be a strong one but the fact that Scotland, for instance, has once shot for the trophy, under a misnomer, does not establish for her any right in the matter. America may be forced to admit that she has made a mistake, but she cannot be compelled by any twisting of logic into perpetuating a wrong The right of no one will be invaded if the N. R. A. of America should to-morrow send out a notice making the match what it was originally intended to be, an international one, where nation shall shoot against nation, and not State or section.

Here it seems essential for the healthful revival of our long-range work, that another Palma match should take place. Great Britain says, through her National Associa tion, that she is ready to enter heartily into such a serior of contests as the originators of the Palma match had in of generous rivalry was not broken, but rather strongth. their minds over. We here can only gate by the match.

We shall lose such compact bands of patriotic co-workers as the Irish and Scotch teams were, and will get in place an imperial team of various elements. We know that such a team can only win against the American team system by remarkably good shooting, or by a fizzle on the part of the home team. But even were the change to bring us stronger antagonists than ever, it should be advocated, because it is a return to plain simple justice, which for so many reasons has been withheld by our Board of Directors here. We want no more "walk-overs," if such they can be called, where no other entry is made. We do not want the dullness of another blank season, but we want the impetus and the improvement which a match Where we are so clearly in the wrong as in will bring. this case, it would be but a slight display of that common sense which we Americans are so fond of claiming, if we should step down and off from our own toes and permit some progress to be made. Great Britain is able, and says she is willing to contest for the trophy, when the conditions are such that she may shoot without protest This may be mere brag. A change in the rule will test it; and, at any rate, we cannot be further from another Palma contest than we are now, for Ireland, Scotland and the other countries are far from showing any desire to come over for another knock-down.

The subject is an interesting one, and we invite correspondence and a free expression of opinion upon it. especially from long-range men.

GAME PROTECTION

SHOULD THE GUN BE TAXED?

Brooklyn, N. Y., Feb. 27th.

BROOKLYN, N. Y., Feb. 27th.

Editor Forest and Stream:—
I have read with interest "A True Lover of the Sport's" complaint, which is to be admired, but with all due respect I hape ho will excuse my opinion if it differs with his in some points. The game haws are so muddled that difficult indeed is the task to arrive at their true sense; greater still the risk following their additing. A two year, prohibitory game law is simply sheer nonsense; to tast the shot gam. I shall presently show, would be a little unfair. If the revenue thus obtained was appropriated to game-keepers they wouldn't get the half of it, because the politicians will surely have the handling of the funds. I was once informed by a trustworthy friend in Suffolk County that the sons of the wealthy aristocracy had been known to shoot quall in the month of August. "Why did you not prosecute them?" I asked. "Hadn't time," was the universal reply. Seeing the need of some such "spy," I at once formed a sporting club, of which it is my pleasure to be Secretary. At the present day this very man who "hadn't time" has said to me: "The first man in the club who shoots a quall before the 1st of November, I'll tell on him and then leave the club." I hardly think there has been a qualltaken out of season in that locality in two years. Now, that friend of whom I speak cannot afford to pay an annuity of even three dollars for the use of his gun, which I am sure is never cracked out of season. I say it would be unfair to depire him of his pastime on that account, and there are more like him.

FERRISEURGH, V.T., Fib. 14th.

FERRISBURGH, VT., Feb. 14th.

Editor Forest and Stream:

Editor Forest and Stream:—

I am sorry to see so many advocating the taxation of guns. The only hope of efficient protection lies in making our game laws popular, and, to do this, anything like class legislation must be avoided. To especially tax his gun would be to burden many a poor man too heavily for him to bear, and if it did not make a poacher of him it would at least make him utterly indifferent to the protection of game of which he could have no share. I know poor men who are as strong supporters of game protection as any in the land, and us vigilant guardians of the woods and waters about them, and as true sportsnen, who could not afford to pay for the privilege of keeping a gun. What would such a man do if a tax, amounting to prohibition, was laid upon their cheap but highly-prized guns? Would they continue to watch the haunts of game, and report violations of game laws, when they were debarred from all participation in what for some of them is their only recreation? No; to be so unselfish is contrary to human nature. Rich sportsmen are too apt to forget that wealth and a fine gun do not make a true sportsmen, any more than fine clothes make a gentleman, and that there are some real sportsmen in the bower ranks who can be the contrary to the gentleman, and that there are some real sportsmen in the bower ranks who can be the contrary to the gentleman, and that there are some real sportsmen in the bower ranks who can be the contrary to the gentleman and that there are some real sportsmen in the bower ranks who can be the contrary to have a support some. to lorge that we attrained a line gift do not make a true sportsman, any more than fine clothes make a gentleman, and that there are some real sportsmen in the lower ranks who ought to be considered in the framing of laws for the protection of game. Such laws, to be popular, must be for the good of all sportsmen, and not of a favored class.

R. E. R.

Cohoes, N. Y., Feb. 16th.

Editor Forest and Stream :

Editor Forest and Stream:—

Let me ask what has the tax on guns to do with the protection of game? Has it may tendency to stop market hunting? Would not market hunters pay the tax and reap greater benefits than now? Few sportsmen would care to pay a tax, as your correspondent suggests, and probably not have leisure to hunt a day in the year. Another reason is that it is taking away the rights of American citizens to keep any kind of gan they see fit. I heartily coincide with your correspondent in his desire to protect game in this State. As he remarks, we have have nowned to the particular to the protect game in this State. As he remarks, we have have nowned and the particular to the particular to the particular to the particular to have smalled hot of game laws, and what do they amount to? There might as well not be any. It is casy enough to make laws; far easier than it is to enforce them. The Legislature makes no provision for their enforcement whatever. They should make an appropriation of a few thousand dollars yearly, and let the supervisors of each cominy appoint suitable men who would enforce the laws. If any number of persons interested in game protection hand themselves together, the same as the Society for the Prevention of Crucily to Animal, then the desired object will be attained. If a prohibitory law were passed for two years, it would not increase the amount of spour

The best way to get out of this trouble is to in the least. The best way to get out of this trouble is to prohibit all shooting during the close season; make it an offense for a person to be found gunning. I am as much interested in game protection as any one, yet I scarcely lave time to amuse myself hunting; but think pot-hunters might be led to turn from the error of their ways if of the law, as it now stands, were administered

NEAR THE ADIRONDACKS, Feb. 23d.

Editor Forest and Stream:—

I decidedly object to a proposition to tax guns and omit riles, for two thirds of the deer-hunting is done with rilles, and in Northern New York there are ten dollars invested in them to one in shot guns. Perhaps it would be well enough not to tax rilles owned by clubs, which are used at target practice only. But I know several who belong to rifle clubs in the cities and large towns who come up here every fall to hunt deer with a rifle of some kind, which should be taxed as much as any gun. What your correspondent says about a two years prohibition have prefetly correct. It would only benefit the pot-hunters. Why under the sun don't they find a way to enforce what laws we now have before making more? As the law is now (allowing August hunting, which I think is wrong,), if it could be rightly enforced we would soon have the woods full of deer. Just consider the great numbers which are destroyed every year out of season—two thirds, at least, of all killed during the year. If these had been allowed to breed, with those which we still have (which are many more than one would suppose), there would be deer enough without any two years' prohibition. I say to our legislators at Albany, go to work and contrive some plan to prevent the slaughter out of season. Tax our guns or anything to do it, but make no more laws until those we have can be enforced. There is not a man in Franklin or St. Lawrence county, who frequents the Adirondacks, but knows what I say is true. All know deer are killed out of scason, and in many instances the parties are known who kill them. But the residents are not going to enforce the laws. That ought to be known by this time. There is no one who cares more for the preservation of game than I do, still there is not a year passes but what I could secure the conviction of dozens, yes, hundreds, if I chose, for violating the game laws. I can do no more than lundreds of others, if they wished. But we have many reasons for not doing so, whic

A New Maine Association.—Per Cand, Me., Feb. 28th.—Of late there has been evinced in this locality a considerable interest in the protection of game and fish, and siterable interest in the protection of game and fish, and it has finally taken shape in the organization of the "Cumberland Game and Fish Protective Association," with its headquarters at Portland. The association has started under favorable auspices, its list containing some of our most prominent business men in the professions and trades. We have already twenty of the leading sportsmen of the city, and more are to come in. Our association should number at least a hundred with the material at hand.

The permanent organization has Robert B. Swift for President, Samuel Hanson, Vice-President, and Herbert M. Sylvester, Secretary and Treasurer. This association does notwish to be regarded as a shooting chib, but has for its primary object the enforcement of the game and fish laws, and to preserve and foster the game and fish which in season afford such healthful and appetizing sport.

We have here in Cumberland County fine woodcock,

"We have here in Cunderland County fine woodcock, snipe and plover, partitige and sea shooting in their season. Salmon abound plentifully in Sebago Lake and its tributaries, bass and trout in its many ponds and streams. It is proposed to make the association a county organization, to embrace among its workers all true lovers of sport, thereby to promote unity of action, the knowledge of natural history, and to obtain all the benefits of a successful organization of this kind, and ultimately to obtain an act of incorporation which shall bring with it full power in the association to enforce proscutions in its own behalf; and we hope to take rank with the best of kindred associations, and to be able to accomplish a good work.

The Cumberland Association has started out with experiments.

The Cumberland Association has started out with excellent principles. We shall take great pleasure in recording its good work in the early future.

celient principies. We small take given presents in recording its good work in the early future.

Migratory Quall in Pennsylvania.—West Chester, Pe., March 11th.—Last June ninety-five quali were liberated by the sportsmen of this borough and near vicinity, principally in the several townships bounding West Chester. For some ten days or two weeks following their liberation (six or eight were freed in a different place) they were frequently seen and reported. Subsequent to this time, however, no reliable information has come to the writer other than from Messrs. George Little, Beaumont Oat and James Ingram, farmers residing in the vicinity of West Chester. The two gentlemen first named on soveral occasions during the summer, and, I believe, early autumn, saw the quall, but noted no increase in the number which were liberated on their properties. As regards their breeding we have no personal knowledge. Mr. James Ingram (on his place five birds were placed), however, advises us that he had in his possession a young quall, that had been found by his son in a field where the stringers had been repeatedly seen and heard. The bird, although not seen by any ornithologist, or other person familiar with the species, Mr. Ingram states positively was a Messina quail. His reasons are: small size of bird, peculiarity of bill, and, as above referred to, labitual frequenting of his premises.

To the officient managers of the Daily Local News the thanks of the sporting fraternity of Chester County are due for the untiring efforts (by adminiting in their columns all inquiries relative to the qual free of charge) which these gentlemen manifested in relation to our importation. We regret to say that, notwithstanding the liberal contribution of valuable space by the journal already namued, but little authentic evidence (we do not refer to the observations of Messrs, Luttle and Oat) was adduced to show that the quall even remained in the

county longer than a fortnight. In regard to their breeding, we think the Ingram "find" is the only one which has any degree of plausibility about it. Several of the gentlemen who were conspicuous in the importation movement, with whom we have conversed upon the subject, are inclined to look upon the importation as a failure.

B. HARRY WARREN.

Lehigh Association.—Allentonm, Pa., March 3d.— At the regular meeting of the Lebigh Game and Fish Protective Association (the following officers were elected for the year 1890: President, W. H. Kramer; Vice Pres-idents, J. Newhard, E. Ritter and E Kramer: Treasurer, Heury Bitting; Corresponding and Recording Secretary, C. H. Bitting; Assistant Secretary, Abraham Stuckert; Board of Directors—Harry Cooper, J. Newhard, William Kramer, H. Berryman, C. Lewis Huber, R. Reinsmith and Augustus Eberhard, of Catasanqua. C. H. B.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl "Bay birds" generally, including various species of plover, sand piper, saipe, curlew, oyster-catcher, surf birds, phalaropes, avo-cets, etc., coming under the group Limacola or Shore Birds.

GAME AND FISH DIRECTORY.

In sending reports for the Forest and Stream Directory to Game and Fish Resorts, our correspondents are requested to give other and rish nessors, our correspondents are requested to give the following particulars, with such other information as they may deem of value: State, Town, County; means of access; Hotel and other accommodations; Game and its Season; Pish and its Season; Bouts, Guides, etc.; Name of person to address.

LIVE QUAIL.-Limited orders for live quail can be filled by Whitley & Morris, 218 Washington street, New York. Price \$6 per dozen.

COSTLY AMMUNITION. - Sportsmen are constantly coming across curious things and having odd experiences. Our correspondent "Buckeye," of Hudson, Ohio, sends us a story of a deer's head sent from Cleveland, Ohio, to Hudson, in which the taxidermist found imbedded in the lower jaw a three-cent silver piece, a ten-cent silver piece and a five cent nickel. In other parts of the head were some buckshot and a rifle ball. The coins were battered and bent out of shape and had shattered the bones. Evidently, our correspondent suggests, some one was short of ammunition, or else had the buck fever.

-We are not among those who decry the things of the present to find all good in the past. We believe the world is moving. The rough-and-ready forefather who went out with his flint-lock could draw a bead on a squirrel and put the ball above that particular individual hair of the head, below which custom would not tolerate mutilation, and doubtless your dilettante who fears to soil his lavender kids will miss the squirrel entirely, and the tree too, for that matter. But we do not for that reason bewail the decadence of skill in the field. We hold that the young gentleman with kids is all the better for his jaunt, and possibly he may in time enter so truly into the spirit of the thing that his kids will be left at home and his eye will sight more quickly and his arms hold more steadily.

The Chinese must go. Twenty-eight sportsmen contested for a shot gun at Seattle, W. T., last month, and, after they had finished their scores, a Chinaman, who runs a wash-house at that place, requested the privilege of trying his skill, and was allowed to do so. He beat all the scores and won the prize.

The third annual reception of the Fountain Gun Club, of Brooklyn, took place Wednesday evening, Feb. It was a most enjoyable affair, and everybody seemed to be having the very best kind of a time. of the prettiest features of the evening was a little sixyear-old lady, with dark flowing hair and laughing eyes, who used her little feet in a way to charm all beholders.

WILD PIGEONS. - Jefferson, Ohio, March 6th .- Pigeo began fiving over this place on Thursday morning. Pri-day morning a great many passed over, but the trappers were unable to light any, the wind blowing so strong the stool piecons would not work. About eight o'clock im-mense flocks passed over from the early

—A party of gunners at Bay Ridge, L. I., last week reported that they started some twenty-five woodcock, among them an albino.

Massachusetts.—Duabury, Feb. 23d.—The past season has been the most open one for years, consequently not many ducks, whistlers, sheldrakes, etc., bagged. What were shot were in the best possible condition. The bay at the present time contains large flocks of fowl but very wild. The game birds here in their seasons are as follows: Partridges, quail, woodcock, snipe, teal, upland plover, son, rail, peep, yellow legs, ring necks, black duck, cots, whistlers, sheldrake, quanders, rabbits, foxes, a few mink, muskrats. Thirty-eight miles from Boston, Old Colony Ratinoad, two hours en route, Hollis Hotel, J. B. Hollis, proprietor.

Workerster Sporsymen's Club.—Worcester, March.

J. B. Hollis, proprietor.

WORGESTER SPONEYMEN'S CLUB.—Worcester, March, 5th.—At their annual meeting this weck the members of the Worcester Sportsmen's Club elected these officers: President, A. P. Pond; Vice-Presidents, W. S. Perry, E. T. Smith; Treasurer, Gilbert J. Rugg; Secretary, Stedman Clark; Directors, Alba Houghton, John Goodell, M. D. Gilman, C. B. Holden.

SNIPE OUT OF SEASON,—Boston, March. 8th.—Mr. Oscod, of this city, captured a Wilson's snipe on the 28th January last, which I have mounted. H. A. S.

FIRST LONG ISLAND SNIPE.—New York, March 9th.—Mr. C. A. Willets, of Flushing, L. I., had the pleasure of killing the first snipe of the scason at that place on Feb. 24th, 1880. It was the only one seen. R. L.

24th, 1889. It was the only one seen.

New York, March 4th.—Yesterday, the 5th inst., I killed on Long Island two English snipe. As this is rather early, should you deem it of enough importance, you might mention it in your next issue.

PENNSYLVANIA—Washington, March 5th.—The Wash-Sportsama's Association has been organized with a membership of thirty-five, and it is hoped to double the number.

ber.
VEGINIA—Petersburg, March 6th.—Eleven shells, one hour, half a mile from railway d-pot, seven English suipe. Markets full of ducks and robins.

J. L. K. MESISSEPIE—Union. Church, Feb. 27th,—We have a shooting club here with a membership of ten. Shall send

shooting club here with a membership of ten. Shall send you some of our scores.

ILLINOIS—DeKalb, March 8th.—The prairie about here is now dotted all over with ponds, and ducks are very plentiful, more so, I am told, than they have been for years, but they are very wild and fly very high, and great skill and good guns are needed. Some good lags are made every day and there is sport for all. Chickens are numerous in season, and so are the sportsmen, so that in the immediate vicinity of the city the "season" is made very short; but the wilds and lakes of Wisconsin are close by, and we need not lack for sport.

W. K. K.

Close by, and we need not lack for sport. W. K. K.
OHD—Clevellund, March 5th.—Was outyesterday, 4th,
and shot a Wilson snipe in very good condition indeed.
Is not this very early? Never killed one before earlier
than March 9th two years since, of which I then advised
you; have shot here nearly half a century around Cleveland. A friend of mine sprung a woodcock 22d of February; but the season is so very early; every indication of
spring—frogs calling, worms up, and other Southern
birds are here some little time since. JAMES CHUBB.

ruary; but the season is so very early; every indication of spring—frogs calling, worms up, and other Southern birds are here some little time since. JAMES CHUBB.

LONG SLAND SPORTSMEN'S ASSOCIATION—The Long Island Sportsmen's Association held its adjourned meeting Monday night. Mr. Chappel, the President, was in the chair. Delegates were present from five clubs. The principal business was the adoption of a constitution and by-laws. The general scheme provided makes each active member of every club of the association a member of the association. All the farmers on the Island who are in sympathy with and will cooperate in the objects of the organization, are made honorary members. A roll showing every member of each club will be prepared, which will be of benefit for reference. The objects of the organization are specified to be "To secure the propagation and protection of fish, game and birds by the recommendation and enforcement of judicious laws prolibiting the killing and sale of game and hish during improper seasons, and the wanton destruction by masportsmalike means. Also to foster genuine social spirit and unison of action among the several clubs of Long Island and their members, and encourage skill in the use of the rod and gun."

The following resolution was unanimously adopted and incorporated in the constitution: "That this association denounces the muitation of birds as unsportsmantike and barbarous, unworthy of gentlemen, and calculated to bring trap-shooting unjustly into disceptue, and we pledge ourselves to do everything in our power, as an association and as individuals, to prevent such practice and punish its perpetuators." It was also declared that any member guilty of such muitation should be expelled, and thereafter remain ineligible to membership.

The molecular of the such should be expelled, and thereafter remain ineligible to membership.

The rollowing the such states of the custom and an individuals, to prevent such practice and punish its perpetuators." It was also declared that any me

doubless thousands of your readers have handled weapons made in his slop. In his prime of life he was an ardent sportsman, and in his later years was excelled by fewns a rifle shot.

A few wild geese have been seen thus early in this vicinity, and business is "looking up" among the gun dealers. Robins and bluebirds have been here for some days past. An acquaintance of mine who knows a hawk from a heron yesterday saw a flock of wild pigeons in one of the towns of this county; they are the first I have heard of in the State this year.

The Monroe County Sportsmen's Club held its amunal meeting last night and reelected the following officers: President, V. J. Baboock; Vice President, J. H. Brown; Secretary and Treasurer, L. A. Pratt. The club has ordered two hundred migratory qualithrough Horace P. Tobey, of Boston, and is on a good financial basis. There are nincty-nine paying members on the roll and applications for admittance pending.

At the charter election Thesday last George M. Schwartz, an efficient game constable, who has held the office the two previous terms, was reelected by a flattering majority and in spite of a determined movement to defeat him, set on foot by law-breakers whom he had prosecuted for illegal fishing.

CORTLAND GUN CLUB.—Cortland, N. Y., Merch 7th.—At the annual meeting of the Cortland Gun Club held at Mr. B. E. Miller's office last evening, the following officers were elected for the ensuing year: President, A. Malan; Vice-President, C. P. Walrad; Secretary, B. E. Miller's office last verning, the following officers were elected for the ensuing year: President, A. Malan; vice-President, C. P. Walrad; Secretary, B. E. Miller's office last verning, the following officers were elected for the ensuing year: President, A. Malan; vice-President, C. P. Walrad; Secretary, B. E. Miller's Treasurer, A. Schermerhorn.

The extremely mild weather of the past winter has enabled the members to practice glass-ball shooting frequently, and sone excellent scores have been made, Thore is much interest

pated.

MONTANA DEER HUNTING.—San Francisco, Feb. 28th.

—I inclose a paragraph or two from my old chum, Dick
Eddy, which may interest you, Under date of Jan. 9th,
Missoula, Montana, he writes: "I was out blunting day
before yesterday and killed ten deer, and went out yesterday to bring them in and killed five more." Under
date of July 15th from same place, he says: "When I
wrote you last I had only started in to hunt. The Quar-

termaster at Fort Missoula and myself went below here about forty miles and hunted ten days; we killed fifty-flive deer and eight mountain sheep." What do you think of that for a hunt?

think of that for a hunt?

BRULE LAKE—Quebec, Feb. 29th.—I see in your paper body some person asking information as to a guide at or near Brulé Lake, north of Ottawa. If he wants to write to any one on the subject let him address his letter to the Postmaster, River Desert P. O., Township of Maniwaki, Upper Gatineau, Ottawa Co., Prov., Quebec. This direction is absolutely correct, but if too long let them leave out the name of the township and it will go just as well. If the parties inquiring are thinking of going there for sport I am afraid they will be disappointed at the poor show of game. All the lakes are full of the gray trout, known in this part of the country as lunge, but the game is scarce and hard to get at. There are moose, carbou, bears, wolves, hares, some partridge, and ducks in summer and early fall, but all the shooting, as I said before, is poor. I have several times been far up the Gattineau, and I find that the best guides are the Indians can be got for fifty cents a day, with ten and tobacco. They will find canoes and all necessatives of this kimt. They are always to be found at the Desert, but let any one beware of allowing them any whisky, except in cases of extreme necessity. Best arm for this section is a good heavy choke-bore or Winchester rifle.

Au Sauble.

DUCK SHOOTING ON LONG ISLAND.

The ducks are flying on Long Island, and we need not urge our city friends to improve the opportunity. Below are reports from three famous ducking grounds. The first is from William Lane, Good Ground, L. I., and was written last week. Good Ground is on the Long Island Railroad, three hours and a half from New York :-

There are lots of red-heads and broadbills in the hav

There are lots of red-heads and broadbins in the bay, There are more red-heads now than I ever saw in the bay, and they are getting in good shape to kill.

Commenced to break up to-day and bids fair to make good shooting, but it is so early I can't get people started, Geese will be along soon now; some in the bay, but know too much.

I have just returned home from a grand day's sporting at Quogue, Long Island (one mile east of Shinnecock Bay), and it may prove interesting to your many readers to know what sort of a "grand" time I had. I left New York last Thursday afternoon, and by 7 o'clock that evening found myself enjoying my after-dinner cigar in Joe Howell's confortable parlor, and I must confess, asking rather anxious questions about the morrow. I've shot so much on the south side of Long Island and have met with so many bitter disappointments that the experience has almost driven me to despair of ever having a really good day's shooting, but this time Fortune proved a willing mistress. Friday dawned warm and clear, with not a putf of wind, much to our disgust; but we managed to kill a few birds during the afternoon. A great many ducks were going toward the north, and occasionally a small gang of geese, but they did not seem to want to stop, and we watched them with aching hearts. Toward sunset the wind commenced to blow sharp from the south, and Joe's eyes sparkled as he told me his hopes of the morrow. Wo retired early, and at 4 o'clock I found myself shivering in the blind, with the men rigging the stool off the point and the wind blowing a gale from the southwest—a dark and gloomy day—a 'ducker's' day—so everything promised. "I think we'll have them to-day," said Joe, as he laid his Parker on the rubber coats beside me.

They were moving now, and, in fact, I could distinctly hear the sharp whistle of wings overhead. It made me feel good, I can tell you. At last the day dawned dark and gloony, and I could see the long, low bluffs across the bay, and presently a dark mass in the air. A warning whisper from Joe, and we hay as still as death.

near the sharp whistle of wings overhead. It made me feel good, I can tiell you. At last the day dawned dark and gloony, and I could see the long, low bluffs across the bay, and presently a dark mass in the air. A warning whisper from Joe, and we lay as still as death. "Now give it to 'en!" and four barrels rang out in the gloomy air. Four dead and I could not tell how many wounded (with a precious little chance of getting them, either). Broadbills are expert divers, and when wounded will swim a considerable way under water, making it very difficult to shoot them over. Joe succeeded, however, in retrieving two, and by the time that he had returned from his long pull I had several more dead among the decoys. I felt at last that I was to have a "day," and so it proved. Single and double shots were frequent, and as the last rays of the setting sun glanced across the waters I counted up my blue-billed beauties—thirty-one—a famous bag (point shooting, remember, gentle duckist) at any time on Long Island. If I could have retrieved the cripples the bag would have counted close on fifty. At all events, I was more than satisfied, and returned to town with a nuch more favorable impression (and a much heavier bag) than I have hitherto experienced.

perienced.

Duck shooting this spring promises well on Long Island. The bays are free from ice, and have been so almost the entire winter. Consequently a great number of birds have remained, and will make excellent shooting, to say nothing of those that are to come. Those who contemplate a few days' sport will do well to consult J. P. Howell, at Quogue, at whose place I stayed. He is a thorough bay man, and has everything pertaining to duck shooting in perfection. Charges are reasonable.

New York, March 3d.

BLUE-BILL.

For good gunning at this season, and a good bay man and gunner, I would recommend Allanson Edwards, of Centre Moriches, Suffolk Co., L. I., via Long Island Ralicoad to Moriches Station. Bither write Edwards to neet party at station or take Moriches stage to his house. His charges are \$3 per day to take horizy out and \$1,50 per day for board.

Edwards and myself shot yesterday from the shore (there being no battery shooting in Moriches Bay, from Smith's Point to Quogue) twenty-five ducks—sprigtail, teal, black and widgeon. There is a State law against battery shooting in this bay, in defiance of which one of the resident gunners uses a battery, and is liable under the law to a fine of \$100. He shot one hundred birds on Tuesday. On Monday, the 23d, a friend and myself

brought down fifteen ducks and eight geese, weather was too mild for geese yesterday. It brought down fifteen ducks and eight geese. The weather was too mild for geese yesterday. I consider Moriches Bay very fine ground for sportsmen, if the resident gunners will protect their interests by rigidly enforcing the law against battery shooting and jacking birds at night, which latter process of slaughter is chiefly indulged in by the life-saving crews, who desert their post of duty, and are one of the causes of the "depletion of game on Long Island," referred to in your issue of 26th ult. I wish you would use your influence to protect this section, as it is one of the best in the neighborhood, and will so remain if properly treated.

New York, March 5th.

WINTER IN NORTH CAROLINA.

H AVING seen frequent inquiries in the Forest and Stream regarding North Carolina and the sports to be found there, and realizing the increasing interest toward all parts of the South as a sporting resort and refuge from the chill blasts of our New England winters, I am persuaded to give a little sketch of Edgecombe County and vicinity. It is situated in the northeastern part of the State, on the Tar River, about seventy-five miles from the scaboard. The principal town, as well as one of the smartest towns in the State is Tarboro, numbering about twenty-five hundred initabitants, of which the colored population are in plurality by about three or four to one white.

The geographical peculiarities of this part of the State are very interesting; undeniable evidences exist of its

three or four to one white. The geographical peculiarities of this part of the State are very interesting; undeniable evidences exist of its having once been the bed of the ocean, the surface of the soil often containing an endless variety of sea-shells, and by digging a few feet, a mixture of bluish carth, shells and fossil bones, called "marl" is obtained, which, mixed with guano, otton seed, or aske, si used as a fertilizer. The character of the soil is a sandy loam, and gives more satisfactory results to the owner, with a crop of cotton, than any other, and though the low prices of cotton for the past few years have greatly impoverished the land-owners, they are waiting for a scason of higher prices on the old staple that will pay up the debt. Some attention, however, is being paid to corn and the cereals. This section is slightly undulating, but nearly level, and is artificially drained by digging a system of canads and ditches which empty into the "Tar River. Springs are surprisingly numerous for a country of this character, and the ditches always contain good water, an important item for ourselves and dogs. Had it been otherwise our settens would have suffered even in winter months. On account of the climate the pointer prevails in the South. Add that statement peck and former for the South. Add that statement peck and is a suffered even in winter months. our setters would have suffered even in winter months. On account of the climate the pointer prevails in the South. Ah! that statement needs qualifying; for the prevailing dog in North Carolina is a mixture, a compound, a comundrum, a "what is it." All sizes, all colors, all shapes, and as you pass across country you are saluted by the confusion of voices of from three to six of these specimens at every poor darkey's cabin. You may ask, how the poor man can afford to feed so many. Just see them once and you will then understand. It costs him no more to feed six than it does one. The mystery of their origin is only equaled by their ability to exist.

costs him no more to feed six than it does one. The mystery of their origin is only equaled by their ability to exist.

In spending a month in this historical land of cotton and darkeys, we located at Tarboro, reached via Philadelphia, Washington, Richmond and Weldon, all rail, or by the Bay Line via Norfolk, etc. As a healthful resort the climate, like the latitude, is a happy medium between New England and Florida, with no cold winds, and seldom any snow or ice; a bracing frosty morning air, balmy noonday, and soft mild evening. Socially considered, we found good hotel accommodations at fair prices, many good shots with gun and rile (the natural result of their being subscribers to Fordstand Tarband), and a hearty, cordial and courfous people; and we made many friends whom we shall remember and cherish on our list with strongest feelings of friendship. Last but not least—the game. This consists, first, of the quali (called here "partridge"), of which there seemed no limit in numbers, and to these we devoted most of our time and powder, filling good bags in spite of their matured strength and activity at this season of the year. There are also sufficient woodcock to vary the sport, and the spring months of March and April bring with them plenty of snipe. Wild turkeys cannot be successfully lunted here without previous baiting, but are more numerous in some adjoining counties. The local law allows the owner of land to prohibit shooting by posting, but even those who had availed themselves of the right freely gave us invitations to come and shoot.

Since May, 1877, the State has given attention to articicial propagation of food fishes, and during the time several thousands of young fry of California salmon, land-lock salmon and brook trout, have been hatched and turned into various waters of the State from the hatchery at Swannanca Gap, Buncombe Co., and the supply of these valuable fishes is thereby rapidly increasing.

Conclusion: Go to North Carolina for health comfort and sport.

Bromfield House, Boston, February, 1880.

A Worth Example.—Washington C. H., Ohio, March 1st.—The severe winter of 1878-79 destroyed many of our quail, yet in some localities where the cover was favorable they survived it. Our Legislature then gave, or tried to give us, a close season this year. The fear of apprehension puts our boys to trapping and netting, as well as encouraging them to shoot them in coveys while pretending to hunt rabbits, and in the absence of the guner, the dread destroyer of the quail, the hawks make their appearance, and by the close of the winter there are fewer quail left than if the season had been left open. This season, however, there has been but little attention given to the law, but numerous efforts have been made toward the destruction of the hawks. These hawks destroy a majority of the hens, thus leaving us with a surplus of cocks. When the mating season sets in, they spend much time in fighting and eventually in destroying one another's nests. We do not want our regular game law tampered with, but we do want it enforced and made popular, which will insure us great quantities of birds. Our late trespass law has had a most salutary effect, and stimulates our boys to sportsmanlike conduct.

The writer offered a premium of a fine gun to the party who would produce the most hawk-hens by the 15th of this month, and that gun will perhaps cost 1,000 hawks their scalps. This offer has also stimulated some individuals

of other localities to do likewise, and while they may kill many hawks they will not save so many quait as if they had commenced earlier. Can you not advise other inviduals and shooting clubs to do likewise? C. C. B.

Eight Dollar Ster Twists.—Sheldon, Vt., March 10th.—Game has dwindled down to the smaller varieties —ruffed grouse, foxes, rabbits, etc. The sportsmen here are mostly of the printitive kind, who cling to the traditional muzzle-loader, tree their grouse with a small dog, take a dead rest, and blaze away at fifteen paces from their game. Wonderful are the stories that they tell about the performances of guns sowned or seen in their boyhood days. "They were genuine Stubb and twist, cost \$\$ or \$10 in New York, sir." In vain do you attempt to reason with them by proving first that a stubb and twist barret alone could not in those days be bought in London for \$10 or double that amount; second, that with our improved system of boring our best guns now cannot begin to equal the performances that they claim those cheap improved system of boring our best guns now cannot be-gin to equal the performances that they claim those cheap guns were able to do. I believe that many things that occurred in our childhood become with age greatly mag-nified, and could we now see them repeated we would find that we have been nourishing the most absurd fal-lacios.

find that we have been nourishing the most absurd fallacies.
A lone lynx lately passed over the adjacent hills, which caused great excitement in the village, even grocery pitch and pemy draw-poker were abandoned for a time. Many were the ways suggested to defend the town. One stalwart son of a Vulcan thought that he could knock him out-of-time with his sledge. Poor little "Felis canadensis," whose thindity prevents you from preying on anything more formidable than a rabbit or young spring lamb, did you but know what terror your presence excites in the heart of mankind, you might with impunity, were it not for the village curs, in some of your jovial moods place our town in a state of siege.

The winter has thus far been a singular one; alternate snow and rain—a good one for small game. Ruffed grouse are very plenty, which augurs favorably for next season's shooting.

SHOOTING MATCHES.

ALLERY RIPLES.—Boston, Morch 7th.—Editor1:—I notice in your issue of March 4th a paraston correspondent, who shoots the Maymard
the flue shooting done with that rife at the
gnolia Riff Galleries, in Boston. I think there
d riffenen whose scores compare favorably
done by Mr. E. F. Richardson and Mr. O. M.
Mattoon, alias J. Merrill, which the following
show, comprising all the perfect scores ever
inuoth Gallery:—
ard, O. M. Jewell has made five clean scores, and
one, With the Ballard, Mr. Jewell has made two

With the Maynard, O. M. Jewell has made five olean scores, and E. F. Richardson, one. With the Ballard, Mr. Jewell has made two clean scores; Mr. Richardson, two; N. W. Arnold, six; W. H. Harrison, fav; P. Hollis, two; and Messra. C. Edwards, H. L. Loo, B. B. Souther, R. Walters, and J. N. Frye, mas J. Nichols, silas N. James, alias J. Anse. President of the Massachusett file Alsociation, openical score cach. This makes 4

total of thirty-four clean scores in all-twenty-two with the Baland and twelve with the Mayuard. The management of these galleries bar no rifle, even allowing the contestants to shoot their own, which privilege Mesrs. Richardson and Jewell exerting the contestants to shoot their own, which privilege Mesrs. Richardson and Jewell exerting the contestants of the contestants of the contestants of the contestants. NIPPER.

THE LYMAN SIGHT.—Mr. William Lyman, the maker of the new rifle rear sight, has received the following letter from a member of the Utah Ritle Association. It was entirely unsolicited, and was accompanied by orders for other sights to be used by other

marksmen of Saft Lake City:—

William Lyman, Esq.:—

BALT LAKE CITY, Utah, Jan. 19th.

DEAN SIR.: The sight you sent me by registered mail reached here three days ago. I could not make it if the small lialiard, so I fitted to a Maynard, 22.

Ritted to a Maynard, 22.

Myself and Mr. Sharp, the owner of the gun, went out to try the sight an hying objects. He first a low sight, and so expressed himself. I tried it, and on the lirst effort broke the ball and made a string of fifteen or sixteen shots, hunding back the gun without a miss. We tried then on objects at various distances, for the purpose of ascertaining its adaptability word of command it exceeds anything it ever saw. Of course, we can imagine what it would be in the field and forest.

One of our sportsmen suggested that while its superiority was manifest in those branches of shooting, it might not be adapted to accurate shooting at a mark. To satisfy myself and him i shoot on command it exceeds anything it offers any own will see that there is not room to place two bullets side by side in there is not room to place two bullets side by side in their longest diameter of the target, all the shots with it at all distances, but will not weary you with the story.

In conclusion, I have to say that I consider your sight the perfection of an idea, which, simple as it is, comprehends the secret feet God-send.

A HUNTER'S EXPERIENCE WITH BULLETS.

A HUNTER'S EXPERIENCE WITH BULLETS.

BOULDER BASIN, Montana. Editor Forest and Stream :-

The article of Mr. Cleveland in your issue of Aug. 28th, 1879, re-calls a discussion—that took place in your columns nearly two years since, and I ask space to submit additional facts in support

It will be recalled that in answer to some strictures of British rifle experts-to the effect that for all the practical purposes of rifle experts—to the effect that for all the practical purposes of hunting, etc., the American long-range breech-loader was as useless an arm as the British muzzle-loader—I commended the American gun as an admirable arm for hunting large game, with a proper modification of sights and ammunition. This opinion was based upon nearly two years' experience with one of the American long-rung arms—hunting in Montana, using a 450-grain solid ball. These views were commented upon unfavorably by several on this side of the water, notably by H. W. C.(Mr. Cleveland), who seemed to ridicule the idea of taking such a weapon in the field. seemed to ridicule the idea of taking such a weapon in the field. The only tangible reason given in support of his view ass that the very sharp twist of the grooving, necessary in the long-range weapon, necessarily and per se caused too high a traffectory for hunting purposes. This objection was successfully controverted by me in reply, I think, by quoting the practice of some of the best rifle-makers of Great British, who in the Express rifle—designed especially for thatees of trajectory—used, in some cases, as sharp twist to the grooving as is used in our long range. Some experiments of my own were also introduced, which, at least to my salisfaction, proved the error of his views. The opinion was my suisiencoin, proved the crive of the subset. The Opanion was then advanced that in a well-constructed rille, filations of trajectory, ceteris problems, is dependent practically upon the relative proportion of weights of powder and ball. So much by way of recapitulation and as an introduction to what follows. This same long-range rille has been used by me

since that discussion, and its powers fully tested upon the large game (antelopes, deer, buffalos, elss, mountain sheep and grizzly barrs) of the finest game region of th's continent. The following score of game for the present season to this rifte, to this date, in-dicates, by the large proportion of animals killed to those bit, a dicates, by the large proportion of animals there to choose min destructiveness scarcely second to any rifle, and certainly shows the adaptability of this class of weapon for hunting purposes, Nothing is chimed for myself on the score of extra skill either as a rifleman or hunter, for I am only an average one; nor is any especial morit claimed for this rifle over other arms of its class, for it is only an average on. What merit I do claim is the successful adapting of the bollow-pointed or Express bullet to an American anapung of the above-pointed of Express synthetic light Express bullet could not be used in any American rille with Express burges on account of its system of rilling. With the exception of a few clks killed for hear butts, and a few males of each kind for specimens, the aim was to kill no animal—bear, of course, exfor specimens, the aim was to kin to animal—oear of cobest, ex-cepted—except for food. When it is recollected what small amount of each careass can be kept in warm weather and packed on animals over mountain trulls, it can be realized how many an-imals can be utilized, even by a small party, in several mouths' exploration of the Yellowstone National Park and the mountains exploration of the following amount and an exhaustic to the north and east. With a little exertion double the amount of deer and els could have been easily killed than is given better this can be the more easily venized when it is stated that six of the else were killed in ten minutes "tring, and were quickly utilized by a ranchman for his winter's supply of ment; also three elks at another time and two on two other occasions in a shorter

elts at another time and two on two other occasions in a shorter time.

Two bullets were used. In animals no larger than the deer, shells were loaded with 105 grains by measure (103 grains by weight) of Curtis & Harvey No. 6, and a 275-grain hollow-pointed alloyed ball, 3-16 inch orlide. For snimals larger than the deer (else, bears, big horns, etc.), same quantity of powder and a 346-grain alloyed ball, 10-01 inch orlide.

The classification below is made from notes taken of the locality and character of each wound at the time.

The game was killed by myself, and does not include what was killed by the packer or others of the party, nor by any hunter in the vicinity. The score is claimed as a fair test of the rifle's capacity. In making out the percentage of "kills" (without a second shot) to the "hits," no shot is counted that did not strike the spinal column or within the cavity between point of shoulder and hips, for rarely "kills" from any rifle in the limbs will secure and hips, for rarely "hits" from any rifle in the limbs will secure game without a second shot.

eaving hit fairly in hody.

Shot at from forty to three hundred yards:—

The 23 animals fell with one hundred and fifty yards, and where

This does not include 3 bull alk and 1 big horn ram known to be ome, with limbs broken, that escaped into timber and

ndred and fifty yards, who was killed by merely dismounting This of itself argues confidence in one's rifle. These eight bears were all so hard hit that only one gave the usual "bawl" given when nof fatally shot. Of course, with such game the necessity was always recognized of putting in the first shot at close quarters, and doing it well.

ters, and doing it well.

Big-horns are nearly as hard to kill dead as elk. With any arm it is very difficult to knock down in his track a bull elk, unless hit in brain or spinal column. Well hit behind the shoulders, they will usually stand from three to ten minutes before falling. Three with the big-horns and six are the elk work killed with the light bul-let, and without a sea animal (amount of sea hi), nower, well bit. The conditions of an animal (amount of sea ho ni six bits) insteri-ally affects the Express bullet. The more they his lower the ve-locity of the splinters of the bill on entering the eavity—which It is really the measure of its destructiveness. An average cik will measure 5ft. 2in. (15) hands) high; 7iff. from rump to tip of nose, as he stands; off. in girth, and 39in. depth of chest behind the shoulders, and will weigh 750lbs, when in fair condition.

Tho rifle is so sighted that with a 25° gr. ball and with fine sight.

Its point blank is 125 yards; coarse eight, 200 yards, trajectory rising seven inches. Turning up a leat, and using a 30 gr, ball, fine sight, 125 yards; coarse, 250 yards. The second leaf also gives a point blank for light ball of 250 and 300 yards. As to accuracy, I have grouped ten consecutive shots, with the

The rotacities, I have group and consequent since, and the 25 fig.r. ball, within an eight inch ring at 200 yards; also ten consecutive shots within a four inch ring at 100 yards. From ten to twenty shots (dependent on state of atmosphere) can be fired with the light ball without materially foulling the barrel.

These details may appear tedious, but they have a material bearing on the adaptability of any weapon for hunting purposes. The object of this paper is to make apparent this showing for one of the American long-range ritles, and that, although only 4 in callbre, it can be made sufficiently destructive for the largest game of this continent.

I don't mean by the above that were I going to order an annespecially for bunting, the long-range model would be selected. I would prefer, on account of carrying on horseback, a two, probably four, linches shorter barrel and a sholl to hold 110, perhaps 130 grains powder. But what would be required would be a rifle of the extreme accuracy of the long-range model (call it by what name you choose and leave the length, etc., to the builder). With me one half the pleasure derived from the use of the rifle is in target practice, and with mo one rifle is as much as it is destrable to look after. It is for this reason I want a rifle that in a fow minutes can be transformed from a target to a hunting rifle, and vice versa. Whoever has traveled around by rail, as I have, with two guns, with two outflus of shells, ammunition, etc, knows its annoyance and trouble. This would be doubly expensive and annoying if traveling through mountains by stage I don't mean by the above that were I going to order an arm neasive and annoying if traveling through mountains by stage

penetre that almoying a travering inloggia modulining of stage or by pack animals.

Any one who attempts the latter mode of getting about will soon appreciate the luxury of having only one rille and outfit to look after, and will nover be bothered with two. You also want a ritle as light as possible and of power sufficient to master any animal you are liable to meet, from a blue grouse to a grizzly

was glad to see by a late circular that one of the Expres makers coincides in some of my views. Alexander Henry, Edin-burgh, whose reputation as a match and Express rifle maker, is second to none in Great Britain, advertises "a match and Express second to hone in creat intrain, acvertuses "a nation and appress ride combined," which means. I presume, that he uses express bullets and express sights in his regular breech-loading match rides. Though the length of this article has exceeded first inten-tions, a few words in answer to Mr. Cleveland's last. With Mr. Van Dyke I certainly understood him that his model ride (i.e. al. Van Dyke i certainly understood nin that he moder nine (a.u cal. 46 grain, 26) inch) was unrestricted as to district, and was the more impressed in that regard from his bringing forward as examples of its destructiveness the tiger of India and the builda buil of the Western plains. His articles are not before me, but of course I stand corrected. I was equally surprised, however, that a rilleman of his experience should find evidence of the flatness of trajectory of a rille, from the fact of a good rileman centerin the tiger's eye at forty yards. Had he not reiterated this opinio in his last eard, I might have thought myself mistaken in hi meaning, as in the other instance.

meaning, as in the other instance.

The fact of a ritle with a driving center at any distance, proves nothing, except that it is sighted for that particular distance. American sporting rides are sighted for different distances—afty, seventy-five and one hundred yards. If the ritleman in question "drew a fine lead" on the tiger's eye my inforence would be the ritle was sighted for fifty yards. Sighted for seventy-five yards the center could be driven by holding a little under, by one who knows his weapon well. So that until more particulars are given of this shot it proves nothing except the nerve and skill of the ritleman, and probably his "good fortune," too, as Mr. V. sugressts.

The term "flat trajectory" is very indefinite, so also "fine the term has trajectory not strow by careful experiment sight's and "coarse sight," unless we know by careful experiment how much the trajectory rises when sighted for a certain distance. By my own idea of the term I do not see how a flat trajectory can be gotten from Mr. C.'s model rille with a forty-grain charge and contral ball of say 200 grains, a proportion of powder of onefifth. Nothing less than a proportion of one in two and a half and one in three will give a flat trajectory up to 200 yards and with proper weight to the hall. No reflection is meant in the above on the Maynard ritle, which stands scarcely second to any of our breech-loaders as a close shooting and excellent arm. sides, I have great respect for it as one of two of the "pion American breech-loaders.

Boulder Basin, Montana.

MOUND CITY CRICKET CLUB.—At a meeting of this organiza-tion held at St. Louis on Feb. 11th, the following officers were tion and at St. Louis on rec. Itat, the toloromy onders were elected for the coming season:—President, Mr. George N. Roster; Treasurer Mr. F. Hackey; Secretary, Mr. William H. Chambors, 208 South Main street; Committee, Messra. P. Adair, B. H. Lycett, J. B. Gige, T. Penn and William Brodles; Captein, Mr. Julliam Ruttwell.

Pachting and Ganoeing.

THE HERRESHOFF SYSTEM OF STEAM PROPUL-

WE take pleasure in laying before our readers a complete exposition of the Herreshoff system of steam generation and propulsion, as applied to pleasure and sporting yachts.

The Herreshoff Manwfacturing Co., of Bristol, R. I., are now at work on their sixty-lifth steam vossel—a list which includes steam yachts, launches, rigs, torpedo boats and gumbouts, varying in size from 17t. to 135ft, in length, These vessels have all attained the highest speed in their several classes, and are always noted for the fine lines of their hulls and for the general excellence of their worknamship, both in hulls and machinery.

innes of their nums and for the general excellence of their workmanship, both in hulls and machinery.

Let us first examine in detail their boiler, which presents a combination of new and remarkable qualities. It is the invention of the Herreshoff Brothers, and is the subject of two patents in this and foreign countries.

By reference to the annexed cut the manner of con-

By reference to the annexed cut the manner of construction and its operation can be easily understood.

The boiler consists of a coil or coils of wrought iron pipe placed vertically over a circular furnace, the whole being surrounded by a double or treble jacket or shell terminating in a smoke-stack on top. The products of combustion cannot escape at the top of the coil, which is closed, but are obliged to find their exit through the spaces at the side between the several turns of pipe which form the coils. Thus the influence of the fire is brought to bear in a very efficacious manner upon the heating surface, giving thereby a very high economic result.

The feed water is pumped into the upper coil, A, which serves as a feed water.

serves as a feed-water leater, through which it flows to the inner part of the coil B the water as it approaches the bottom becomes

more and more evaporized. When it finally reaches the end of the outer coil, C, only a

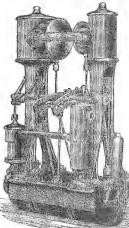

the end of the outer coil, c, only a small portion of the water, say ten per cent, which has been forced in at A remains liquid. The contents of the coils are discharged through the pipe E into the separator. D, in which has been forced in at through the pipe E into the separator. D, in which the steam and water become separated. The steam flows off through the pipe F to the superheating coil, G, from which it is taken directly to the engine. The water, which has been separated from the steam in the separator, falls to the bottom of it. The height at which it stands may be known by the glass guage H. The excess of feed-water blown off from the separator is returned to the coil A by a circulating pump. A simpler method, however, but accompanied by a small loss of heat, is to discharge the excess of feed-water into the condenser, whence it is taken by the air pump and delivered into the hot well, from which it is taken by the feed pump and again carried to the coil. A.

the coil, A.

The boiler is absolutely safe from explosion—a most conforting assurance to all in its neighborhood. It is less than half the weight of ordinary boilers, and can be put into operation in a remarkably short space of time; only five or six minutes are required to raise steam. Its economy of fuel is claimed to be equal to the best form of boilers in use—a claim which seems reasonable in view of the large amount of heating surface exposed.

The engines adopted by this company are of the compound condensing type, and possess many advantages over the old plain system—nutably, economy of fuel and freedom from the noise and other missances connected with exhausting steam into the open air. There is also by with exhausting steam into the open air.

freedom from the noise and other missuees connected with exhausting steam into the open air. There is also by this method an increased durability of working parts, owing to working the steam at a high rate of expansion. The accompanying cut is of a comported condensing engine for yachting use. It is from the photograph of the engine exhibited in New York in 1879, at the Fair of the American Institute. To if and to the boiler medals of excellence and a diploma were awarded. We summarize the advantage offered by this system as follows: First, the extrem to lightness of the machinery and

machinery and boiler, which gives to the ves-sel a maximum degree of speed, buoyaney and bnoyancy and seawerthiness with a mini-mum of resistance and draught of water. Second, by the use of the Herreshoff boiler perfect safety is insured, with compactness form and durability of parts, as natural draft only is used in the consump-tion of fuel, Tho quickness by which steam is raised is a most important feawhich

highly appreci-ated by yachts-men and sportsmen who "brook no delay when on pleasure bent." Third, by the use of the surface condensing engine the amount of fresh water required is reduced to a minimum, 30 gallons of which will suffice to carry a 15 h p, yacht 300 miles. As has been noticed, the absence of noise caused by exhausting steam is of great value

of noise caused by exhausting steam is of great value considered from a sporting view, because the approach to game is made more sure and casy. Fourth, through using the compound system the greatest economy of fuel is obtained; witness tis success in the transathantic steamship service and British yachts, the old style of engine being entirely displaced by the compounds during the last fen years. Although the money value of the fuel nsed in a steam yacht is not large, still economy in its use is important, because the vessel is enabled to make a longer (rip with a given amount, or the number of times necessary to coal up is lessened and a nuisance mitigated. The following is a description of a sporting yacht built by this Company a few months since for Messrs. Charles R. Flint and Joseph T. Earle, of this city. She has been in successful operation in southern waters, and shown herself to be everything desirable for the purposes for which she was intended. Length, 24ft.; beam, 6ft. 6in.; draft of water, 2ft.; speed, 7f; miles per hour; consumption of coal, 20 lbs, per hour; weight of boat, including machinery, 3,000 lbs. Her interior is beautifully finished in mahogany, cherry and oak. An important novelty in the form of a folding tent and awning combined was furnished with this boat. It is formed by employing a number of curved longitudinal ribs of beautifully finished in mahogany, cherry and oak. An important novelty in the form of a folding tent and awning combined was furnished with this boat. It is formed by employing a number of curved longitudinal ribs of wood, the ends of which are pivoted at the extreme forward and after parts of the standing room or cockpit. These ribs are covered by waterproof cloth, and when not in use fold themselves in a compact form on the gumwale of the beat just outside the rising. The tent may be instantly raised by swinging the uppermost rib or batten over to the opposite gumwale. When thus closed it forms a perfect protection against wind and weather and gives plently of moon to stand up under. Either side of the tent may be raised at will, or both sides of it may be partly raised when needed as an awning. This folding tent will be found an important addition to all open launches, giving a ready means of protection against the elements and mosquitos.

The Herreshoff Manufacturing Company have now in course of construction several vessels which deserve special notice. A fine steam-yacht for Mr. Graham, of Battimore, the keel of which was laid the 1st of February, and the yacht is expected to go into sevrice the last of May Length over all, 120 ft.; beam, 16 ft.; depth, 6; ft. Her main cabin, situated aft of machinery, is 21 ft, in length, and is to be finished in oak, Out of this open three state rooms and a pantry, all finished in maple.

She has one vertical compound engine, the cylinders 104 in and 18 in.

miles an hour. Forward of the manchinery are situated a large duning rom, kitchen and quarters for the crow. The after state-room is fitted up with bath tubs and every modern convenience. This beautiful model has been named the Glerom. There are also nearly completed at the company's workshops two launches for the United States Navy, cach 33 ft. houg and \$3 ft. beam. They are very handsomely finished internally with mahogany, cherry and oak: metallic trimmings of polished bronze. They are to be furnished with improved compound engines, and their trials will take place early in April. A lorged-boat for the Imperial Government of Russia is in an dranaced state of completion; length 60 ft. and beam manched the completion; length 60 ft. and beam will produce the steam twenty miles per hour, and will probably leave this country early miles per hour, and will probably leave this country and visitors from all parts of the country are received asily and shown the different operations in process. There are five or six steamers belonging to different paraly present a striking scene of activity and lusule; the stoam vessels, yachts and torpeto-boats they turn out have a just reputation for speed, symmetry and durability. The Herreshoff brothers are inembers of the Institution of Naval Architects, London. It is only fair to add that for originality in conception and boldness in design the inventions and improvements of this firm constitute a star in our firmanent of mechanical achievements of which the country may well be proud. That their coil system should form the basis for initiations in design shows. Their flexible shafts, midship propellers, safety valves of the simplest and most reliable kind, in which springs and combinations have been superceded by a simple oblong bar of steel, all give evidence of the depth of insight and mechanical adroitness which have given Bristof (R. L.) a world-wide name, and carried the reputation of American skill to all quarters of the globe. We should very much like to see the Herreshol springs and combinations have been supercoded by a simple oblong bar of steel, all give evidence of the depth of insight and mechanical adroitness which have given Bristol (R. I.) a world-wide name, and carried the reputation of American skill to all quarters of the globe. We should very much like to see the Herresholfs try their hand at a Uitana, Lightning, or Miranda of twenty-four wills fouce.

To Correspondents .- Owing to the press upon our columns we must request correspondents to observe brevity and terseness in their letters. Come to the point at once, avoid repetition of ideas, and remember that anything appearing in this journal is read by tens of thousands every week, and is therefore open to challenge by those of another raind. Above all, avoid stupid personalities and insipid flings; as arguments they are not in the least convincing, but are rather the evidence of a green pen and immature ideas, and besides, we propose to draw the line strictly in this journal and exclude all matter which is not creditable to gentlemen. Some correspondents have misconstrued the liberty accorded them as a privilege to indulge in license which has been

very properly resented in some letters to hand, and which will be published next week. Those who cannot comply with the above, and who are unable to write from the standpoint of gentlemen, may bereafter expect to find their communications relegated to the waste basket.

THE FACTS IN THE CASE.

I n justice to our correspondent, "Corinthian," we printed his letter in full last week, without comment, as evidence that we have always desired these columns to be perfectly impartial to all. No one will object to the right of "Corinthian" to entertain impresssions of his own concerning the performance of yachts, often enough open to honest differences of opinion. But wherein his letter sheers off the course of sound deduction, he will not object to being cautioned, "no higher." The Eurydice (not Eurymedon) was an old-time frigate "razeed" into a corvette long before modern naval science had come to the surface, and had not a vestige of scientific design about her. Her capsizing in a squall is proof that a little more science and a little less "talent" would have saved her from the catastrophe which befell her, although the sticks would have been taken out of any vessel under the circumstances of being struck by a white squall with stun'-sails set below and aloft. The capsizing of the Captain has never been laid to the charge of Providence. She represents a very plain case in which the superciliousness characteristic of the marlinspike in matters appertaining to naval architecture usurped the legitimate province of the naval draughtsman. Long before the Captain was launched, E. J. Reid, M. I. N. A., pointed out clearly the danger to which "rigged monitors" were liable, in his papers on curves of stabil-Captain Cowper Cowles, R. N., however, like many another old seaman, fancied that, having won reputation in his proper sphere, he was also better able to judge of a vessel's design than others who make such work a spec ialty, and departed radically from the drawings approved by the admiralty. After the disaster, the curve of stability of the Captain was calculated at the Admiralty and very plainly indicated wherein the turret ship fell short. It is quite certain, that had the curve been calculated before the vessel left port, no sane person would have allowed her to proceed to sea. The Captain is therefore only another illustration of the danger of trusting to luck and "natural" talent in mechanical structures. A glance at her curve of stability in comparison with those of the monitor Miantonomah, the broadsides Vanguard and others, and the high freeboard turret ship Monarch, tells the whole tale in a second. Our correspondent is referred to the transactions of the I, N. A. Instead of Providence being at fault in the matter, it was a clear case of ignorance assuming the garb of knowledge. Concerning the behavior of naval vessels at sea, we can testify from experience that they leave little or nothing to be desired in this respect : our correspondent has put too much faith in the yarns of political demagogues and sensational newspapers. As for "scientific" sail drafts, if a simple case of statical balance is to be considered such, we have furnished too many sail plans to yachts not to know that balancing the center of effort and the center of lateral resistance holds in practice quite as well as in theory. Our correspondent, possibly not knowing all the "ins and outs" of other men's business, must not charge every designer with the results he may observe. Owner's crotchets, kind and influential friends acting as oracles, and special objects, often have a more powerful voice in the planning of a vessel than the designer's convictions. The latter works like any professional person, "to order," and can be charged only with success or failure when free to follow his own ideas, which is seldom the case.

THE CANOE CONGRESS.

Editor Forest and Stream

Your issue of the lat of January, 1880, came to hand a few days ago, and it is to the very considerate kindness of Mr. N. H. Bishop that I owe the pleasure of having same.

that I owe the pleasure of having same.

The idea of a Canoe Congress is by no means new, as the appended circular will show. In the summer of 1877 the idea was first started in public at a canoe linich of the Clyde Canoe Club on an island in Loch Ridun, Kyles of Bute, at which a good dozen of the best of the C. C. C. were present. Meeting with a hearty support there, circulars were drawn up, printed and distributed among the members of all the canoe clubs in Great Britain. Promus of support and attendance were numerous, and had all the romises been fulfilled there would have been a "congress" of over fifty. The so-called International, or rather Inter-Canon Clul cruise, was a most complete failure, as not more than a dozen took part in it, several of whom had not the stamina to paddle too part in the service of whom had not not be samine of passes their canoes against a really strong wind up the Kyles, and thore-sult of the whole concern was a most complete flasco. The primary reason of this signul fadure seemed to have been the dilliculty of canoelsts, many of whom had business to detain

the dimetric of canocists, many of whom has not sheets or extant them, to arrange to get awy at the time appointed; others again objected to take their canoes long railway journeys, and a gen-eral want of spirit seemed to pervade the canoeing fraternity. Although the number of canoeists in this country can be count-

ed by hundreds, yet there is very great difficulty even 'crack' races at Hendon to convene a gathering of a couple of "Cream Reason Tendon to convene a gathering of a compact dozen. Now, for our American cousins to expect a large turn out from "over the water" is too much of a good thing. The days of classish here have departed, and even were a dozen Rob Hoys to play the "Gathering of the Claus" on a dozen bagpipee all over Scotland, and send round a hundred "Flery Grosses," so little

canoeing spirit is there that not a dozen good paddles would

Much better luck is to be hoped for on Lake George, that little queen of lakes, and certainly any ennotest going there from here will require to be well taken care of, as there are few who would go so lar for a canoo cruise. A National Canoo Club cannot be formed all at once. There would be great difficulty in arranging go so lar for a como cross.

formed all at once. There would be great difficulty in arranging headquarters and likewise convening meetings for general or committee purposes; but with Mr. Bishop, Mr. Norton, and a few more well-known American names, the thing seems almost already done. Success to the Canoe Congress and a large turn out in August, is the wish of CHARLES G. Y. KING,

Royal C. C., Clyde and Mersey C. C.

-The following was the programme of the Inter-Canoe Club

cruise, 1878 :-Route.—Start from Roseneath, 12th July, at 9 A.M., and down Fith of Clyde via Cloch and toward Lighthouses toward the Kyles, the camp for the night being settled by the captain of the cruise. The principal camp to be on the Bute shore opposite Kames and Tighnabruaich (or Innens), where members can Join later on, by steamer from Greenock, distance about twenty

Discipline.—The cruise to be under the management of a cap-tain and two mates, assisted by a committee of representatives from each club, and to consist of a quartermaster (one who knows the ground) and a purser.

Fluys.-Each club to fly its own flag in all cases at the most-head Private flag at the peak. The captain and officers to be distinguished by special flag carried at the mizzen mast-head or flag-

Each canocist will make his own arrangements as to provisions and camping gear. Plenty of facilities for provisions along the

route.

Charls.—Intending cruisers are recommended to obtain West
Coast of Scotland chart-sheet 2, No. 2,159. Price 2s. 4d.

Races.—Ruces will be held along the route. Further particulars

peists of all clubs, and also these who are not members

any club, but who are friends of members, are requested to inti-mate their intention of joining at an early date to one or other of us.

YACHTING NEWS.

PORTLAND YACUT CLUB.—The annual meeting was held March 3d, and the reports of the officers showed the club to be In a pros-perous condition. It has 137 members with twenty-eight yachts, perous condition. It has 137 members with twenty-eight yachts, the Corinthian element predominating strongly, much to the advantage of the club. It is proposed to renovate and enlarge the club house at the end of Custom House pier and make the porta half-way harbor for yachts from Beston and New York bound East to Mt. Desert, the neighboring waters of which are rapidly becoming the regular summer cruising grounds for an increasing fleet from the southward. The officers for the year are: Commodore, Wm. Senter, Jr.; Viec-Lom, W. Willis Goold; Fleet Capitaln, Geo. C. Owen: Secretary, Geo. D. Rund; Treasurer, F. H. Jordan; Masser, J. H. Dyer; Regatte Committee, Gom, Wm. Senter, Jr., ex-officia, T. K. Jones, G. W. Rich, I.T. Wyer, F. L. Mosely, The mutch for the challenge cup has been fixed for May 20th. ter, or., cr-open, I. K. Johes, G. W. Rien, I. T. Wyer, F. L. Mosely. The match for the challenge cup has been fixed for May 20th. Additions have been made to the library and an active season is certain. Visiting yachts are sure to receive any attentions required. The flort consists of the following vessels, with their w. Lleigths annexed: Schomers, Junsher, 23.5; Commoder, 41.4; Idlewild, 24.7; Lauvel, 27; Lizzie T. Davis, 35.5; Lotus, 39; Minnte. Ideadd, 33.7; Lauvet, 2.; Luzze F. Lowis, 30.5; Louis, 30; Monic, 35; Nallie, 25; Petrel; Rang, 50; Spavike, 30.8; Indiae, 24.4; Winsper, 27. Sloops: Casco, 32; Edda, 21.7; Georgie, 29.9; Gussie, 22.3; Grace, 27; Idea, 21.2; Mory, 22.5; Miel, 20.4; Nuvelly, 20.6; Sprite, 18.11; Scan, 17; Tempus, 27.2; Tedlyidi, 35.7; Vol., 17.5; Wille, 28.10. The Portland Y, C. is represented in the National Yachting Association.

ATLANTIC YACHT CLUB.—The annual spring races have been ALLANTIG VACUE CLUE.—The annual spring races have been fixed for June 9th. The officers for the year are as follows: Commodore, Latham A. Fish; Vice-Commodore, Henry W. Hogins Rear-Commodore, W. R. Vermilye; Preasurer, B. C. Field; Measurer, John H. Rhodes; Corresponding Secretary, J. L. Marcellus, Trustees, Goorge A. Thyer, J. B. Kawwell, G. H. Ripley, H. S. Manning, W. H. H. Beebe and J. H. Rodes; Regatta Committee, J. L. Marcellus, George A. Weber and J. L. Van Wyck. We understand that some members of the thinker purchased brementy at Rw. Highe, L. was the technique of the property of the second secon

Wyck. We understand that some members of the club have purchased property at Tay Ridge, L. I., near the Manhattan Heach Railroad, and that they propose to erect a club-house, and possibly a breadwater to secure a good harbor, in place of Gowants Bay, which is now being filled in and shoaling rupidly.

EASTERN YACHT CLUB.—The following are the officers for the year:—Commodore, P. D. Roardman; Yice-Commodore, C. W. Amory; Rear-Commodore, Henry S. Hovey; Secretary, Henry B. Jackson; Treasurer, Patrick T. Jackson; Mensurer, Goorge A. Goddard; Regatta Committee, John Jettries (chairman), Daniel Appleton, Robert S. Russell, Francis W. Lawrence, George A. Goddard. A club-bouse is soon to be creeted on Marblehead Neck which is to be a model of its kind. A store-house will be kept in which is to be a model of its kind. A store-house will be kent to connection with it for the convenience of yacht owners. Out-door sports, archery, croquet, etc., will be encouraged in the

grounds.
SOUTHWARK YACHT CLUB.—At the annual meeting held March
1st at their headquarters, 1,233 South Second street, Philadelphia,
the usual reports were submitted. The club numbers 158 members e usual reports were summers. The cummumors for members th 39 boats. They average 15ft. Sin. long, 4ft. 6in. beam and in. deep. They carry masts from 22 to 24ft. long, booms 22ft, edir sails have 17ft. holst, 29ft. leach and 11ft. 6in. head. The offi-rs for the year are: Commodore, John H. Rouch; Vice-Com-There sails and with a loss, SM, casted and III, on the least, The officers for the year are: Commodore, John H. Roach; Yice-Commodore, J. F. Quinn; Rear Commodore, Francis George; Treasurer, Isaac Sharp; Secretary, James Winterbottom; Measurer, William Maltman; Regata Committee, Frank Maxwell, Samuel Rhoades, Isaac Sharp, J. F. Quinn and George W. Carlley.

Beyerly Tacur Club.—Officers elected for the year as follows: Commodore, Walter Lloyd Jetries, of the Bluebell; Vice.

lows: Commodors, white: Boya actives, or the Bulgar, vice, Commodors, George Lee, of the Perl; Secretary and Treasurer, Richard D. Sears, of the Psyche; Nessurer, Arthur B. Denny, or that—i, Regatha Committee; George P. Gardner, of the Olyat, J. Grafton Minot, of the Breez; Francis G. Lowell, of the Xornat; Sidney, W. Burgess, of the Bulgar, Richard D. Sears, of the And the following Committee has been selected to coner with the Dorchester Yacht Club concerning uniform salling rules for Boston waters: Walter Lloyd Jeffries, Edw. Burgess Patrick Grant, Jr.

SALEM BAY YACHT CLUB.—Since its incorporation the Salem Y. C. has been called the Salem Bay Y. C. Its fleet is rapidly growing. The well-known Vif. Brenda, Breeze and other large

growing. The well-known Viv. Branda, Breez and other large Boston yachts baye Johned. It ime chul-house and sheltered harbor offer strong inducements, and as the management of affairs is in the hands of wide-awake gentlemen, who see in yachting something else than dishling bouts, the S. B. V. C. is destined to become one of the leading organizations on the coast. Bosron VAGHT CLIB—An exchange says: "The Boston Yneht Club took a new lease of life last year, and, with young men for a regardle committee, could beast of the linest regardles, both in number of craft and amount of prizes, of any club in New Bagland. As the same gentlemen are retained on the committee for the coming season, there can be no doubt but the reputation earned last season will be retained."

DORCHESTER YACHT CLUB. - Messrs. King and Clark, of the Discripsive Cache Claim Angests. King and Chate, of the Dorchester Yacht Club, yachtsmen well known in Boston and vicinity, have soli the fast center-board sloop Wolf to Mr. C. F. Adans, Jr., of the Quiney Y. C., and expect to have a sloop of about 40ff. the coming season. The Dorchester Y. C. are preparing the dates for regarding states for the season, which promises to be a very brilliant one. CENTER-BOARD.

QUINCY YAGHT CLUB.—Opening regatta set down for May 15th.

Many new boats will appear under its colors. Peter Turner is
building an 18ft. cat, Lelois another, and Mayberry is finishing one

HAVERHULL YACHT CLUB,—Mr. E. F. Brown has had a new craft built, 2 ift. long, with a roomy cabin. She is to be used mainly

CUTTERS FOR MEXICO.-The New York Safety Steam-Power. CUTTERS FOR MEXICO.—The New York Safety Steam-Power. Company is filling a contract for three steam revenue cutters for the Mexican Government. The hulls are being built in Sam Pine's yard, Greenpoint, from models turnishe de by the well known modeler, Chas. Hillman, of City Island. They are 05t; long, 12ft. beam, 5ft. 6in. deep. The englues are of the Babeook & Wileox compound type; cylinders, 8; and 12in. by 12in. stroke; pressure, 120ibs; schooner rigged; cight tons coal in bunkers. Boiler is of the cyl-adrical return tubular kind, 5ft. diameter and 8ft. long, having 450 square feet heating surface, and is built of Oifssteel, three-cighths of an inch thick. They will have trunk enhing, cerry two lifeboots and a crew of ten men, and are incabing, carry two lifeboats and a crew of ten men, and are intended to steam eight hundred miles on their bunker capacity.

THE VALUALIAH.-Messes, Lawley & Son, South Boston, expect to launch the new keel sloop they have in hand early in April She is 40ft, on deck, 36ft, w. l. and 14ft, beam; frames of white She is 40tt, on deek, 50tt, w. I. and 14tt, beam; frames of white onk, 4x2 in, spaced Hin; planking nearly all in one length of yel low pine. Her calon trunk is 17t, 6m, long, 9t, and 15m, high; height between deeks, 6f; 2m, two staterons, w. c., housing topmast; intended for cruizing and racing. The same builders are at work on two hollow topmasts for the furcous old _linefac, which are to go on end before her departure for the West Indies; then a below become and the force her departure for the West Indies;

which are to go on end before her departure for the West Indies; also a hollow beom and topmast for the Drewn.

SENSIBLE—Says the Boston Herald: "Several new keel-boats, under 20ft, are being built in and around Boston, among them one by Tiloston of Dorehester, only 18ft, long. Keel-boats of this size are again becoming popular." Evidently, Boston no longer stuffers from the center-board craze, but has recovered from the marks, and Now, York shows unmistable letter of Evidentians. mania, and New York shows unmistakable signs of following mania, and Rew York shows unmissiaknoie signs of tonowing. With keels, tow ballast, less beam and more depth, oven the "little ones" will boldly take to distant cruising. Model is what we want for safety, not toninge.

A Case in Point.—We learn from the East that, "in regard to

A CASEIN POIST.—We learn from the East that, "in regard to joining the National Yachtling Association, we hardly think we could get a committee together to represent us, as the N. Y. A. is apparently going to allow shifting ballast in small boats. This we can never consent to in any form." As yet, no salling rules have been drawn up by the N. Y. A., and we should not like to assume to speak for them on this lead.

our own views have always been sufficiently pronounced in the matter, but the N. Y. A. will sail its own ship as it chooses and

take the consequences.

NEW YACHT.—Mr. A. Carey Smith is engaged upon the design New TACHT - All Course and the State of the feet longer.

feet longer.

The ACTIVE.—We learn that alterations were made to this yacht, departing from the original design furnished. This proves the correctness of some of our remarks in this issue, and should be a caution to critics not to let slip the dogs of war until they are in possession of the bot tom facts.

THE DOLPHIN.—This sloop, formerly the property of Governor Straw, of New Hampshire, and built by Herreshoff, of Bristol, has been purchased by Mr. Arthur L. Dean, and In accord with the prevailing tendency, has been altered into a keel by Smith, of City Point, South Boston.

by the Long Island R. R. to make connection at Greenport, L. J. with steamers to Newport and Block Island. This will place three yachting ports in direct communication with each other, and will prove of great service to yachtsmen.

THE VIKING. This grand keel sloop i receiving a thorough overhauling inside, and may have to figot bard for it with new Valhalia. Lawley & Son, who seem to do nost of the work in

manna. Lawley & Son, who seem to do most of the work in beston, have the job in hand. BOUND AUROAD.—Pierce Bros., of South Boston, will shortly shin a cabin-cat to some American residents in Turkey. She is 27ft, long, 23ft, w. L. and Hft, beam.

Signs of the Times.-Sloop Mabel, of torchester, W. H. L. Smith owner, has come to it likewise. Sh: is to have an iron show of 1,800 pounds added "where it will do the most good."

snow of Asso pounds added "where it will be the most good." Sensible Mabel.

MEASUREMENT.—A correspondent object: to the proposal to adopt some standard freehoard for measurement, and adds; "Let adopt some standard freeboard for measurement, and adds, "Let a man build what he likes and take his clauses." If it can be shown that such a course will not clash with our "Axiom IV.," his suggestion has our approval. But if it would lead to the con-struction of dangerous and uncomfortable low freeboard ma-chines, the adoption of a standard freeboard or depth is much to be preferred. In countenancing "standard depth" in these col-umns we were giving volce to the fears of many inal natual depth would prove incompatible with seaworthiness, a quality which in American yachts needs nursing more than any other. It these fears can be shown to be groundless, and if freeboard will not suffer by measuring actual depth, then our correspondent's sug-gestion to substitute the latter for an assumed figure will meet genton to substitute the latter for an assumed figure will meet with indorsement, for it will simplify measurement to a multi-plication of three main dimensions. We may add, that "length" should be the mean length, to prevent an otherwise impossitive stunting of overhang.

Possibly, before resorting to the more complex rule involving

Possibly, before resorting to the more complex rule involving "standard freeboard," it may be well to apply sharply the "three dimensions rule" and observe its effect upon design. If the cloven foot of low freeboard shows itself, then it would be time to seek a cure. We are led to these remarks, Lecause we know the difficulty of making anything but the very simplest formula The DODING. This association of the state of
